1970 CENSUS OF POPULATION

PC(S1)-50
June 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Occupation and Residence in 1965, for the United States: 1970

(The data presented here are from tables 1, 2, 7, and 8 of Final Report PC(2)-7E, **Occupation and Residence in 1965**, which contains additional information on labor mobility and change in occupation, industry, and State of residence between 1965 and 1970, as well as more detailed technical explanations)

Over one-half (56.9 percent) of employed men 20-64 years old reported that in 1965 they were in the same major occupation group as in 1970. The remaining 43.1 percent were either working in a different major occupation group in 1965 or were in the Armed Forces or not working.

Less than one-half (47.1 percent) of employed women 20-64 years old reported that in 1965 they had the same major occupation group as in 1970. The majority (52.9 percent) of employed women at these ages were working in a different major occupation group or were not working in 1965.

The probability that 1970 employed persons were working in 1965 in the same major occupation or industry group is highly related to age. Among employed men 20-34 years old, only 34.9 percent reported that in 1965 they were working in the same major occupation group as in 1970; for men 35-49 years old, 67.8 percent reported that in 1965 they were working in the same major occupation group as in 1970, and for men 50-64 years old the percent rose to 72.1. A similar pattern characterizes industry shifts (shown in table 7).

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 25 cents domestic postpaid or 15 cents G.P.O. Bookstore.

The low percent of workers at the youngest age group reporting that five years earlier they were working in the same occupation or industry group as in 1970 reflects not only change in occupation or industry but also a high rate of entry into the labor force. Consideration only of men who were working at both dates (data from table 2), shows more clearly that the likelihood of changing occupation is highly associated with age. Among men working at both dates, only 39.0 percent of those 20-24 were in the same major occupation group at both dates, compared to 53.3 percent among men 25-29, 64.0 percent among men 30-34, 73.4 percent among men 35-49, and 77.2 percent among men 50-64. Change in industry also reflects this pattern; for men working at both dates, the percent staying in the same major industry group rises steadily from 44.2 at ages 20-24 to 81.6 at ages 50-64.

There is a relationship between level of earnings and past change in labor force status or occupation. For employed men 20-64 years old, only 34.0 percent of those with 1969 earnings of under $3,000 were in 1965 working in the same major occupation group as in 1970; but among employed men with 1969 earnings of $15,000 or more 74.8 percent reported that in 1965 they were working in the same major occupation group as in 1970. This relationship exists for all three age groups shown in table 1--ages 20-34, 35-49, and 50-64.

Migration is also related to change in labor force status or occupation. Among employed men 20-64 years old, 61.0 percent who lived in the same State in 1965 and 1970 reported working in 1965 in the same major occupation group as in 1970. In contrast, only 35.4 percent of employed men 20-64 years old who lived in different States in 1965 and 1970 reported working in 1965 in the same major occupation group as in 1970.

Men who moved over very long distances during the 1965-70 period were more likely to have experienced a change in labor force status or occupation than were men who moved intermediate distances. Among employed 20-64-year-old men who moved between States within the same region between 1965 and 1970, 38.5 percent were working in 1965 in the same major occupation group as in 1970, compared to 32.7 percent among men who had moved between regions.

DEFINITIONS AND SAMPLE SIZE

Definitions and technical explanations for the statistics presented here, as well as information on sampling variability may be found in Final Report PC(2)-7E, **Occupation and Residence in 1965.** The data are from a 5-percent sample.

SYMBOLS

Three dots "..." mean that the base for the percent is too small for it to be shown.

Table 1. **Percent of Persons 20 to 64 Years Old with the Same Major Occupation Group in 1965 and 1970 by Major Occupation Group, Earnings in 1969, Migration Between 1965 and 1970, Years of School Completed, Age, Race and Spanish Origin, and Sex: 1970**
