ACKNOWLEDGMENTS

This report was prepared by Emmett F. Spiers, John F. Coder, and Robert W. Cleveland, assisted by Donald E. Larizza, of the Family and Individual Income Statistics Branch, Population Division. The report was prepared under the supervision of Mitsuo Ono, Chief of the Family and Individual Income Statistics Branch. Overall direction was provided by Murray S. Weitzman, Assistant Division Chief, (Economic Statistics Programs), Population Division.

SUGGESTED CITATION

U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 85, "Money Income in 1971 of Families and Persons in the United States," U.S. Government Printing Office, Washington, D.C. 1972.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, $2.00.

MONEY INCOME IN 1971 OF FAMILIES AND PERSONS IN THE UNITED STATES

(Advance data on the 1971 income of families and persons were issued in July 1972 in Current Population Reports, Series P-60, No. 83)

Median income of the Nation's families went above $10,000 in 1971 for the first time in U.S. history.

The 1971 median family income of $10,290 was about 4 percent higher than the 1970 median of $9,870. However, because of price increases, the 1971 median income was about the same as the 1970 median income in terms of constant dollars.[1] Among the 52.3 million families with civilian heads, approximately 64 percent were headed by year-round full-time workers. The median income of these families was $12,440.

Of the 53.3 million families in the United States in March 1972, 27.6 million or 51.7 percent received incomes of $10,000 or more in 1971. There were 9.9 million families (18.5 percent) with incomes between $7,000 and $10,000; 6.0 million families (11.2 percent) with incomes between $5,000 and $7,000; and 9.8 million families (18.5 percent) with incomes below $5,000 in 1971.

Table A. Number of Families and Unrelated Individuals by Total Money Income in 1971

(Families and unrelated individuals as of March 1972)

Total money income	Number of--	
	Families	Unrelated individuals
Total	53,296,000	16,311,000
Under $1,000	784,000	1,749,000
$1,000 to $1,999	1,339,000	3,365,000
$2,000 to $2,999	2,242,000	2,457,000
$3,000 to $3,999	2,574,000	1,657,000
$4,000 to $4,999	2,888,000	1,324,000
$5,000 to $5,999	3,027,000	1,062,000
$6,000 to $6,999	2,955,000	945,000
$7,000 to $7,999	3,327,000	850,000
$8,000 to $9,999	6,560,000	1,168,000
$10,000 to $11,999	6,686,000	702,000
$12,000 to $14,999	7,674,000	526,000
$15,000 to $24,999	10,399,000	386,000
$25,000 and over	2,841,000	120,000
Median income	$10,285	$3,316

[1]See Monthly Labor Review, April, 1972, U.S. Department of Labor, table 24, page 96.

There were 5.2 million Negro families in March 1972, comprising 10 percent of all families. In 1971, the median income of these families was $6,440. Taking into account the changes in price levels and sampling error, this is not significantly different from the 1970 median income. The 1971 median income of Negro families was about 60 percent of the median income for white families ($10,670). Statistically, this ratio is not significantly different from that of 1970. Among the 5.1 million Negro families with civilian heads, approximately 49 percent were headed by year-round full-time workers. The median income of these families was $9,130.

The median incomes of men and women in 1971 were about $6,900 and $2,410, respectively; the difference reflecting, in part, the fact that a much larger proportion--about 56 percent--of all civilian male income recipients reported working year round full time in 1971 compared with 31 percent for women. For men working year round full time in 1971, the median income was $9,630. The corresponding figure for women was $5,700, or about 59 percent of the income of men.

These are some of the highlights obtained from the inquiry on 1971 consumer income conducted in March 1972 in connection with the Bureau's Current Population Survey. The survey covered the civilian noninstitutional population and members of the Armed Forces living off post or with their families on post in the United States. The 1972 survey shows there were about 204,840,000 persons, of whom 53,296,000 are family heads, 134,946,000 are other family members, and 16,598,000 are unrelated individuals, i.e., persons living alone or not related to others in the household including those under 14 years old.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains), prior to deduction for taxes. The fact that many farm families receive part of their income in the form of housing and goods produced and consumed on the farm rather than in money should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney income is also received by some nonfarm residents.

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on a relatively small number of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting.

INCOME OF FAMILIES

During the past 24 years, the level of median family money income in current dollars shows a continuous rise in spite of a few cyclical slowdowns in economic activity in this period. Thus, between 1947, the first year that money income figures were regularly published from the Current Population Survey for the United States as a whole, and 1971, median family income in current dollars has more than tripled, rising from $3,030 in 1947 to $10,290 in 1971. Although some of this increase was eroded by rising prices, the net gain in real purchasing power is still substantial. In terms of constant (1971) dollars, median family income increased from about $5,480 in 1947 to $10,290 in 1971, a compounded annual rate of increase of about 3 percent over the 24-year period.

The sustained rise in family income from 1947 to 1971 affected low and high income families. While the total number of families increased by about 16.1 million families, from 37.2 million families in 1947 to 53.3 million families in 1971, the number of families with incomes below $4,000 (in constant 1971 dollars) declined by 5.0 million (from 11.9 million to 6.9 million) over this period. On the other hand, for the same period, the number of families with incomes of $10,000 or more (in constant 1971 dollars) showed a substantial rise, increasing by 21.9 million (from 5.7 million to 27.6 million). Thus, in constant 1971 dollars, twice as many families in 1947 had incomes under $4,000 as had incomes above $10,000, whereas in 1971 almost four times as many families had incomes above $10,000 as had incomes below $4,000.

Nevertheless, there has been no statistically significant change in the relative income distribution as measured by the percentage shares of aggregate family income received by fifths of families, ranked by size of family income. In 1971, the lowest fifth of families received about 5 percent of aggregate family income; the highest fifth received about 42 percent. As shown in table 14, these relative income shares have not varied significantly in the past 24 years.

Differences in family incomes by regions. There are regional differences in family income with the Northeast, North Central, and Western Regions averaging higher than the National median, and in the South, somewhat lower (Table 27). The median family income in the South was $8,980, or 13 percent below the National median. The regional differences also exist for Negro families; median income for Negro families ranged from $5,410 in the South to $7,620 in the West. For white families, the median income ranged from $9,710 in the South to $11,290 in the Northeast. In all regions, the median income for Negro families was below that of white families.

Time series data on the percentage of families by size of income (in constant 1971 dollars) for each of the four regions of the United States show differential growth patterns by regions (Table 10). Between 1961 and 1971, median family income in the Country increased from $7,770 to $10,290, a rise of 32 percent. However, this relative increase was exceeded by two regions, the North Central and the South, which showed increases of 36 percent and 50 percent, respectively.

Differences in family incomes by farm-nonfarm residence. In 1971, the median income of nonfarm families was $10,430, about 45 percent higher than the median of $7,190 for farm families (Table 16). The percentage difference in 1961 was 83 percent, indicating relatively greater gains, although from a much lower base, in the income level of farm families compared to that of nonfarm families. In current dollar terms, the median income of farm families increased from $3,240 in 1961 to $7,190 in 1971, whereas for nonfarm families, the median income rose from $5,920 in 1961 to $10,430 in 1971. The percentage of farm families with incomes below $4,000 decreased from 60 percent in 1961 to 25 percent in 1971, whereas the percentage of farm families with incomes of $10,000 or more increased from 6 percent in 1961 to 33 percent in 1971.

Differences in family incomes by selected social and economic characteristics. Median family income levels vary depending upon the social and economic characteristics of the family head, e.g., race, age, sex, educational attainment, employment status, and work experience. Another important determinant of family income is the number of earners per family. As can be expected, younger family heads are more likely to have lower incomes than older family heads and family heads with less education have lower family incomes than family heads with more education. For the United States as a whole, Negro families have lower income than white families, for example, in 1971, the median income of Negro families ($6,440) was

60 percent that of white families ($10,670);[2] however, in the North and the West, the median income of young Negro families in which both the husband and wife had earnings was not significantly different from the income of comparable white families. Median income of families headed by a female is lower (about one-half in 1971) than that of families headed by a male.

As a general rule, family income tends to rise until the family head reaches late middle age and to decline thereafter. In 1971, the median family income rose from $6,910 for families in which the head was under 25 years old to $12,900 for families headed by a person between 45 and 54 years old, and then declined to $5,450 for families in which the head was 65 years old and over (Table 17).

Families headed by persons with some college background were generally more heavily represented in the upper income brackets. Approximately 76 percent of families with family heads having 1 year or more of college had incomes above $10,000 in 1971. Families headed by college graduates (4 or more years of college) had a median income of $16,730, which was 48 percent higher than that for families headed by high school graduates in 1971. Although 35 percent of families headed by persons completing elementary school had incomes of $10,000 or more, their median income was only $7,670, or 46 percent that of college graduates (Table 28).

In general, families headed by men have higher incomes than families headed by women--$10,930 for families with male heads in 1971, about double the $5,110 median income for families with a female head (Table 17). About two-fifths of the families headed by a female had incomes below $4,000 compared with about one-tenth for families with a male head. Approximately 56 percent of families headed by a male had incomes of $10,000 or more, whereas only 18 percent of families headed by a female had this amount of income.

The median income of husband-wife families with wife in the paid labor force ($12,850) was considerably higher than that of families where the wife was not in the paid labor force ($9,740) (Table 17). About 36 percent of families with wife in the paid labor force had incomes of $15,000 or more, whereas only 22 percent of the families in which wives were not in the paid labor force had this much income. However, the chances of the wife going into the labor market declines as the earnings level of the husband increases.

Since most families derive their income entirely or largely from the employment of the family head, his employment situation and work experience, and occupation are important factors in determining the level of family income. The median income of families with employed heads was $11,590 in 1971 or about 49 percent higher than that for families with unemployed heads ($7,800) (Table 33). The median family income for heads who worked 50 to 52 weeks at full-time jobs was $12,440 in 1971 compared with a median family income of $5,940 for families in which the head worked 50 to 52 weeks at part-time jobs. Periods of unemployment during the income year were cited as the most important reason (about 44 percent of responses) for family heads working part year.

Families whose heads were self-employed professional, technical, and kindred workers had the highest median income ($21,400) in 1971. The lowest median incomes were received by families with heads who were employed as private household workers ($3,220), farm laborers ($5,000), and farmers and farm managers ($6,700).

In 1971, there were 28.1 million multiearner families. Although supplemental earners are often only part-time workers, these workers have an important influence on the economic level of the family. The median income of husband-wife families with at least three earners (husband, wife, and other relative) was $16,560 compared with only $9,690 median income for husband-wife families in which the husband was the only earner (Table 30).

Obviously, these different social and economic characteristics related with family income do not operate singly but interact with each other simultaneously, resulting in different levels of family income. One example of this type of interaction is the following analysis of the differences in income levels of husband-wife families by race of head, earner status, and by regions. It shows in more detail the contribution of working wives toward higher family income levels, especially among Negro families.

Difference in family incomes of husband-wife families by race of head, by earner status, and by regions. Table 65 shows that of the 42 million

---

[2]Another measure of white-Negro income differential is given by the degree of overlap of income distributions of white and Negro families. In 1971, the overlap was approximately 72 percent. For a detailed description of this measure, see Technical Paper 22, Measures of Overlap of Income Distributions of White and Negro Families in the United States, by Murray S. Weitzman, published by the Bureau of the Census.

white husband-wife families in the United States, 18.5 million or 44 percent were families in which both husband and wife worked and had earnings. Their 1971 median family income was $13,030 or 32 percent higher than the $9,900 median for white families in which only the husband worked and had earnings. Approximately 1.8 million or 55 percent of the 3.3 million Negro husband-wife families were families in which both the husband and wife had earnings. Their median family income was $10,370, or 54 percent higher than the $6,740 median for Negro husband-wife families in which only the husband had earnings.

In the North (including the Northeast and North Central Regions) and the West, the earnings of white wives accounted for about 25 percent of family income for husband-wife families in which both the husband and wife had earnings compared with 34 percent contributed by Negro wives for comparable Negro families (Table 71). For younger families--husband under 35 years old-- the white working wife in these families contributed 28 percent while the Negro working wife contributed 37 percent to their respective total family income. Because of sampling variability, the percentage contribution to family income of the working wife in young Negro families is not significantly different from the percentage contribution of the working wife for all Negro families. The larger contribution of Negro wives to total family income is partially explained by different percentage distributions in weeks worked last year between Negro and white wives. In 1971, 57 percent of Negro wives worked 50 to 52 weeks compared with 51 percent for white working wives (Table 68). About 27 percent of white wives and only 22 percent of Negro wives worked 26 weeks or less. This work pattern difference between white and Negro wives is reflected in their overall mean earnings. In 1971, the mean earnings of all Negro wives residing in the North and West was $4,470, 20 percent higher than the $3,720 mean earnings for all white wives.

In the South, however, the mean earnings of white working wives was $3,550 or 28 percent higher than the mean earnings of Negro wives ($2,770). In contrast, no appreciable differences were found between white and Negro wives' contributions to total family incomes or in their work experience patterns.

COMPARABILITY OF ESTIMATES FROM THE MARCH 1972 CPS WITH ESTIMATES FOR PREVIOUS YEARS

The data for 1971 collected in the March 1972 Current Population Survey (CPS) are, in some instances, not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definition, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and poverty rates. However, the changes may have more impact on the population levels in different subgroupings such as the total number of persons or families either overall, within some particular income interval, or below the low-income level.

A detailed description of the changes appears in the Bureau of Labor Statistics report, Employment and Earnings, Vol. 18, No. 8, February 1972.

The figures shown in this report for metropolitan areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's as defined on the basis of the 1960 census. There are significant differences in the population classified as metropolitan in each of these definitions. For the 1970 definitions of SMSA's, see U.S. Census of Population: 1970, Number of Inhabitants, PC(1)-A1, United States Summary.

Another change in the Current Population Survey which affects occupational data only, is the inclusion of a supplemental question, "What were your most important activities or duties?", which provided additional information for classifying persons by occupation.

For further information on these problems see the appropriate sections in Definitions and Explanations.

RELATED REPORTS

Current Population Survey. Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 84. A cross reference of tables contained in this report with comparable tables included in other reports in the P-60 Series can be obtained by writing to Meyer Zitter, Chief, Population Division, Bureau of the Census, Washington, D.C. 20233. Frequently, tables showing the cross-classification of income and other characteristics have been published in

the Series P-20 and P-23 reports of the Bureau of the Census and in the Special Labor Force Reports of the Bureau of Labor Statistics. Series P-23, No. 39 "Differences Between Incomes of White and Negro Families by Work Experience of Wife and Region: 1970, 1969, and 1959" contains data comparable to tables 65 to 68 and 71 included in this report. Series P-60, No. 83 "Money Income in 1971 of Families and Persons in the United States" contains advance 1971 income data cross-classified by various characteristics. Series P-60, No. 84 "Household Money Income in 1971 and Selected Social and Economic Characteristics of Households" contains 1971 income data on households.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Decennial censuses. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the black population and the population of Spanish origin.

Statistics on income in 1969 collected in the Current Population Survey of March 1970 differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances. In the first place, the survey data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the Current Population Survey and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of Current Population Survey enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self enumerated in the 1970 Census. Moreover, income data in the Current Population Survey are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within 3 of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median family income reported in the 1970 census was $9,590, 1.7 percent above the comparable figure of $9,433 derived from the March 1970 Current Population Survey. This difference is smaller than the difference of 4.5 percent between the medians compiled from the 1960 census and the March 1960 Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, to be published in the American Statistical Association Proceedings of the Social Statistics Section, 1972.

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 1,191,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and

renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1971, the underlying sampling methods and estimation procedures have changed. For a discussion of changes see Employment and Earnings, Vol. 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

The figures shown in this report for standard metropolitan statistical areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's defined on the basis of the 1960 census. The median income in 1969 of families residing in metropolitan areas based on the 1970 definitions and procedures is 0.5 percent lower than that based on the 1960 definitions and procedures. This difference arises partly as a result of the inclusion of new and smaller SMSA's with lower income relative to previously defined SMSA's. The median incomes of men and women were 0.3 percent and 1.5 percent lower, respectively, based on the 1970 census definitions relative to those based on the 1960 census definitions.

Central cities. The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

a. The additional city or cities have at least 250,000 inhabitants.

b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Mississippi, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Arizona, Colorado, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Alaska, and Hawaii.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts, or net rental income; (6) public assistance or welfare payments; (7) unemployment and workmen's compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, and other periodic income.

The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 was coded as $15,000.

It should be noted that although the income statistics refer to receipts during the preceding

year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains) prior to deductions for taxes. The fact that many farm families receive part of their income in the form of rent-free housing and goods produced and consumed on the farm, rather than in money, should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney incomes are also received by some nonfarm residents. They often take the form of business expense accounts, use of business transportation and facilities, full or partial compensation by business for medical and educational expenses, etc. In analyzing size distributions of income, it should be recognized that capital gains tend to be concentrated more among higher income units than among lower ones.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties, include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Public assistance or welfare payments include public assistance payments such as old age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as

so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings--the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment; and

Income other than earnings--the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under $1,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment, income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The median incomes as shown in this report are calculated from the corresponding income size distributions by linear interpolation within the income interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median. Thus, the median family incomes greater than $10,000 as shown in tables 18 and 66 differ from corresponding medians shown in tables 16 and 19, respectively, because of interpolation differences. For example, median family income for all families as shown in table 18 is $10,265, or 0.2 percent lower than the comparable median of $10,285 as shown in table 16. The median for white families as shown in table 66 is $10,622, 0.5 percent lower than the comparable median of $10,672 as shown in table 16.

In general, the median income values are calculated based on the intervals in the table which contains the medians, with the exception of the tables in the "Trends in Family Income" section and table 43. The medians for 1971 shown in the "Trends in Family Income" section are based on the intervals shown in table 16, while the medians presented in tables 43, 56, 59, and 60 are based on the intervals shown in table 44. The medians shown in table 66 are based on the intervals shown in table 18.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, hospitals, homes for nurses, convents, monasteries, and ships.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals. The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual. A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Married couple. A "married couple" is a husband and his wife enumerated as members of the same household or group quarters. In table 46 the category "married couples 62 years old and over" includes all couples of which either member is 62 years old and over. In the P-20 reports on Household and Family Characteristics married couples are classified by the age of the husband only.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation, class of worker, and employment status in tables 33, 50, 59, 60, 68, and 71

refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, class of worker, and industry in tables 32, 37 to 39, and 55 to 58 refer to the job held longest during the income year.

In several tables two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession, or trade, for profit or fees. Included in the self-employed groups in these tables are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings included in this (1971) income report were based on the classification systems used in the 1970 Census of Population. These groupings, with minor differences in the group titles, were also used in the 1970 income report containing data compiled from the March 1971 survey. Between the 1970 and 1969 income reports which included data obtained from the March 1971 and March 1970 surveys, respectively, there were changes in the industry and occupation classification systems. The income reports from 1961 through 1969 utilized the 1960 census classification systems. However, beginning with the 1970 income reports, the 1970 census systems were used. For major groupings, especially for the industrial groupings, there is relatively little difference in comparability between the systems used in the 1960 and 1970 Censuses of Population. A detailed comparison of these two systems can be found in the Bureau of the Census Technical Paper 26, 1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements. Additional information may be obtained from a paper, "Changes Between the 1960 and 1970 Census of Population" by Stanley Greene and John Priebe presented at the August 1972 American Statistical Association meeting held in Montreal, Canada. Also see "Revisions in Occupational Classifications for 1971" by John E. Bregger in Employment and Earnings, Volume 17, No. 8, page 5, published by the Bureau of Labor Statistics, United States Department of Labor.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "craftsmen").

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. An estimate of the size of the base (number of units) of each percent distribution by income in 1971 is shown in most of the tables in this report. The base figures shown in this report were prepared by inflating weighted

sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census. A more detailed description of this change can be found in an article entitled "Revisions in Current Population Survey" Employment and Earnings, Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

The major effects on family statistics resulting from the introduction of population controls and estimation procedures based on the 1970 census were to raise the number of families from 51,237,000 to 51,586,000 in the March 1970 CPS and to lower the number of related children under 18 from 69,786,000 to 68,746,000 (see table B). Moreover, the relative difference in the number of families was greater for Negro families (2.4 percent) than for white families (0.5 percent). The effect of the change in procedures on income data was negligible.

Table B. Comparison of the Number of Families and Median Income From the March 1970 Current Population Survey Using Population Controls Based on the 1960 and 1970 Censuses

(Numbers in thousands, unless otherwise noted)

Selected characteristics	1970 census (1)	1960 census (2)	Percent difference[1] (3)
Number of families, total	51,586	51,237	0.7
White	46,261	46,022	0.5
Negro	4,887	4,774	2.4
Number of persons in families, total	184,891	185,396	-0.3
Number of related children under 18 years, total	68,746	69,786	-1.5
Median family income, total	$9,429	$9,433	(Z)
White	9,797	9,794	(Z)
Negro	5,984	5,999	-0.3

Z Less than 0.05 percent.

[1](3) = ([(1) - (2)] ÷ (2)) x 100.

Computation of aggregate income by fifths. In calculating aggregate income by fifths (or for the top 5 percent) of families, the aggregate income distribution by size of income was estimated initially. The aggregate income distributions underlying the data shown in tables 14 and 15 were obtained by multiplying the number of units (families or unrelated individuals) in each income interval by an estimated mean income for the corresponding income interval. For income intervals below $15,000, the midpoint of each class interval was used. (Note: Before calculating the aggregate income distributions, all income intervals below $15,000 which were greater than $1,000 in width were split into $1,000 intervals by interpolation assuming that incomes within the wider interval were distributed according to a Pareto distribution. The midpoints were then calculated based on these smaller income intervals.) A value of $19,000 was used for the $15,000 to $24,999 interval. For the $25,000 and over interval, the estimate of the mean was calculated based on a Pareto Curve fitted to the number of units in the $15,000 to $24,999 interval.

The upper income level of a particular fifth of units ranked by income was estimated by cumulating the number of units in successive income intervals and by interpolating linearly within the income interval in which the fifth falls (designated the reference interval). After determining the upper income level for this fifth, the aggregate income below this income level was estimated by multiplying the midpoint for the interval between the upper income level of the fifth and the lower income level of the reference interval for this fifth by the number of units within this segment and adding the result obtained to the total aggregate income below the reference interval. The aggregate income for a particular fifth was determined as a residual by subtracting the aggregate income below the next lower fifth from the aggregate income for the particular fifth.

For a more detailed description of the method of computing aggregate income by fifths, see Technical Paper No. 8, Trends in the Income of Families and Persons in the United States: 1947 to 1960, pages 16 to 26, or its revision, Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964.

The following assumptions were used in the above procedures:

1. In subdividing the income intervals below $15,000, the interpolation was made using a Pareto estimation technique.

2. In estimating the mean income per income interval, midpoints and the Pareto estimation techniques were used.

3. In finding the upper levels of each fifth, a linear interpolation technique was used, and

4. In obtaining the mean income of the subinterval between the upper level of the fifth and the lower level of the reference interval, midpoints were used as a proxy for mean income.

As the size of the income intervals and the number of units within any given interval increases, the validity of these assumptions becomes more problematical. Starting from 1962 through 1970, the lower level of the top 5 percent of all families (the upper level of the bottom 95 percent of families) fell between $15,000 and $25,000.

In 1971, the lower level of the top 5 percent was greater than $25,000. Since the possible errors which can be associated with interpolation in the $25,000 to $50,000 interval are not of the same magnitude as those in the $15,000 to $25,000 interval, it would not be correct to develop estimates of the aggregate income of the top 5 percent using procedures and assumptions comparable to those used for previous years. Therefore, the Bureau is not publishing estimates of the percentage share of aggregate income received by the top 5 percent of families in tables 14 and 15 where the lower level of the top 5 percent is greater than $25,000 until such estimates are obtained using better estimation procedures. This work is in progress and revisions of the current estimates are planned to be published in the 1973 final report for money income in 1972.

Computation of constant-dollar distributions. The adjustment for price change was made by converting the income distribution for families and unrelated individuals for each year (1947 through 1970) into 1971 dollars on the basis of the change in the Consumer Price Index. The first step required the subdivision of broad income intervals, such as $7,000 to $9,999 and $10,000 to $11,999, into smaller intervals to provide a more refined basis for interpolation to convert to constant dollars. This subdivision was accomplished from generalized tables that were prepared from Pareto Curves that were fitted to frequency distributions having varying degrees of concentration in the open-end limits.

After the detailed frequency distributions were obtained, the procedure was then to convert the limits of each income interval into 1971 dollars adjusted by a factor representing the change on the basis of that year's price index (1971 = 100); next, to compute by interpolation the number of families and unrelated individuals in each of the detailed class intervals; and then to combine the estimates into broad income brackets.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices have not been developed for families in different income class intervals. Neither did the available data permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data cover also family savings and income tax payments. For these and other reasons, the constant-dollar figures, particularly in the income range over $10,000, are to be regarded as approximations.

The constant-dollar distributions in table 10 were obtained by applying the same procedures as used for the Country as a whole to the current-dollar family income for each region. Previous studies indicated that regional price indices differed only slightly from the U.S. Index. The limitations noted earlier for the United States distributions in terms of constant dollars apply also to the regional distributions. It should also be noted that the adjustments for price change have been introduced in order to measure changes in real incomes within a region over time, and that they have limited use for the purpose of interregional comparisons. The available consumer price indices measure the relative change in price levels in each region and make possible a comparison of the relative changes of constant-dollar income between regions. These indices do not, however, reflect geographical differentials in price levels and do not, therefore, make it possible to compare the absolute levels of constant-dollar income between regions.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Social and Economic Statistics Administration of the Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the

years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition. The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data. The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 88 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "The OBE Size Distribution Series: Methods and Tentative Results for 1964" by Edward Budd, published in the American Economic Review, Vol. LIX, No. 2, May 1969.

3. Population coverage. The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. Average income. The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live

on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Surveys of Consumer Finances. The Survey of Consumer Finances which has been conducted annually by the Survey Research Center of the University of Michigan provides, among other data, information on the size distribution of income. These surveys are based on nationwide samples that cover all persons in private households. Several important differences between the Survey of Consumer Finances and the present report may be noted:

1. The income-receiving unit in the Survey of Consumer Finances estimates is the spending unit or household, whereas the data in the present report relate to persons 14 years old and over and to families.

2. The Survey of Consumer Finances estimates are based on a sample which is different from and smaller (approximately 2,000 spending units in 66 areas) than the census sample. Differences between the results are subject to sampling variability arising from each survey. This factor alone could account for moderate discrepancies between the two sets of data.

3. There are some differences in the estimating procedure. The Bureau of the Census inflated its weighted sample results to agree with independent estimates of the civilian population of the United States by age, race, and sex, whereas the Survey of Consumer Finances weighted sample results were inflated to agree with independent estimates of occupied dwelling units.

4. Only eight income questions are asked for each person in the Bureau of the Census sample whereas numerous detailed questions on income and other financial items are asked of the head of the spending unit and all other members in the spending unit in each household in the Survey of Consumer Finance sample.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $1,700 (less than $2,300 if 65 years old or over) and married couples receiving less than $2,300 ($2,900 if one spouse is 65 years old or over; $3,500 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of $7,800 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained in the March 1972 Current Population Survey of the Bureau of the Census. The sample was spread over 449 areas comprising 863 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 47,000 occupied households were eligible for interview each month. Of this number 2,000 occupied units, on the average, were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. In addition to the 47,000 there were also about 8,000 sample units which were visited but were found to be vacant or otherwise not to be interviewed.

The estimating procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that all members of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables C, D, E, F, G, and H are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Table C. Standard Errors of Estimated Numbers of All Families and White Families

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	5,000.....	66
250.....	16	10,000.....	88
500.....	22	25,000.....	112
1,000.....	31	50,000.....	158
2,500.....	48		

Table D. Standard Errors of Estimated Numbers of All Persons and White Persons

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	5,000.....	86
250.....	20	10,000.....	119
500.....	28	25,000.....	178
1,000.....	39	50,000.....	224
2,500.....	61	100,000.....	218

Tables C and D show the standard errors of the estimated numbers of total or white families and persons in a given category. Tables E and F show the standard errors of the estimated numbers of families and persons of Negro and other races in a given category.

Table E. Standard Errors of Estimated Numbers of Families of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	1,000.....	26
250.....	14	2,500.....	34
500.....	20	5,000.....	48

Table F. Standard Errors of Estimated Numbers of Persons of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	2,500.....	54
250.....	18	5,000.....	69
500.....	26	10,000.....	72
1,000.....	36		

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators of the percentages, particularly if the percent is large (50 percent or greater).

Table G shows the standard errors of the estimated percentages of families in a given category. Table H shows the standard errors of the estimated percentages of persons.

Illustration of use of the table of standard errors of percentages. Table 29 shows that an estimated 11.7 percent of families with three earners had an income of $10,000 to $11,999 in 1971. Since the base of this percentage is 5,269,000 families with three earners, interpolation in table G shows that the standard error of the estimated 11.7 percent is approximately 0.4 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.4 percent. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.8 percent. That is, this 95 percent confidence interval would range from 10.9 to 12.5 percent.

Difference between two sample estimates. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristics in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will over-estimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 29 of this report shows that in 1971 an estimated 8.2 percent of families with three earners had an income of $8,000 to $9,999. Thus, the apparent difference in the percentage of families with three earners with incomes of $10,000 to $11,999 and $8,000 to $9,999 is 3.5 percentage points. The standard error of 11.7 percent is approximately 0.4 percent, as shown above. Table G shows the standard error of 8.2 percent on a base of 5,269,000 families to be approximately 0.4 percent. The standard error of the estimated difference of 3.5 percent is about $0.6 = \sqrt{(0.4)^2 + (0.4)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the sample would differ from the difference derived using complete census figures by less than 0.6 percentage points. The 68 percent confidence interval around the 3.5 percent difference is from 2.9 percent to 4.1 percent, i.e., 3.5 percent ± 0.6 percent. A conclusion that the average estimate of the change derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 2.3 percent to 4.7 percent and thus we can conclude with 95 percent confidence that the proportion of families with three earners with an income in 1971 of $10,000 to $11,999 is actually greater than the proportion with an income of $8,000 to $9,999.

Medians. The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base.

Table G. Standard Errors of Estimated Percentages of Families

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)								
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000
2 or 98	1.4	0.9	0.6	0.4	0.3	0.2	0.1	0.1	0.1
5 or 95	2.1	1.4	1.0	0.7	0.4	0.3	0.2	0.1	0.1
10 or 90	3.0	1.9	1.4	1.0	0.6	0.4	0.3	0.2	0.1
25 or 75	4.3	2.7	1.9	1.4	0.9	0.6	0.4	0.3	0.2
50	5.0	3.0	2.3	1.6	1.0	0.7	0.5	0.3	0.3

Table H. Standard Errors of Estimated Percentages of Persons

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
2 or 98	1.7	1.1	0.8	0.5	0.3	0.2	0.2	0.1	0.1	0.1
5 or 95	2.7	1.7	1.2	0.9	0.5	0.4	0.3	0.2	0.1	0.1
10 or 90	3.7	2.3	1.7	1.2	0.7	0.5	0.4	0.2	0.2	0.1
25 or 75	5.4	3.4	2.4	1.7	1.1	0.8	0.5	0.3	0.2	0.2
50	6.2	3.9	2.8	2.0	1.2	0.9	0.6	0.4	0.3	0.2

Confidence limits of a median based on sample data may be estimated as follows: (1) From table G or H using the appropriate base, determine the standard error of a 50-percent characteristic, (2) add to and subtract from 50 percent the standard error determined in step (1), and (3) the confidence interval for the median corresponding to the two points established in step (2) are then read off the distribution of the characteristic. A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table G or H.

Illustration of the computation of the standard error of a median. The median income of families with five children was $10,110 in 1971 (Table 19). There were an estimated 1,148,000 families of this type.

1. From table G, the standard error of 50 percent of these families expressed as a percentage is about 1.5 percent.

2. As we usually are interested in the confidence interval for the median at the two-standard-error level, we add and subtract twice the standard error obtained in step (1). This yields percentage limits of about 47.0 and 53.0.

3. Since 41.7 percent of these families had incomes below $9,000 and 7.4 percent had incomes between $9,000 and $9,999, the dollar value of the lower limit may be found by linear interpolation to be:

$$\frac{47.0 - 41.7}{7.4} \times \$1{,}000 + \$9{,}000 = \$9{,}716.$$

Since 49.1 percent of these families had incomes below $10,000 and 13.0 had incomes between $10,000 and $11,999, the dollar value of the upper limit is found to be:

$$\frac{53.0 - 49.1}{13.0} \times \$2{,}000 + \$10{,}000 = \$10{,}600$$

The 95 percent confidence interval is $9,716 to $10,600.

Table I contains 68 percent and 95 percent confidence intervals for various medians of differing magnitudes and bases. A 68 percent confidence interval is defined such that if many samples are taken and a one-standard-error confidence interval is formed for each sample median, about 68 out of 100 of these intervals will contain the median which would be found if a complete census were taken. For a two-standard-error confidence interval, about 95 out of 100 of the intervals formed would contain the census median.

Table I. Sampling Variability of Selected Medians

Table and characteristics of families and persons	Base (thousands)	Median income	Confidence interval	
			68 percent	95 percent

[1]Limited to families with head 25 years old and over.
[2]Limited to persons 25 years old and over.

Approximation of the standard error of the mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}}^2 = R\left[\frac{\sum_{i=1}^{c} p_i x_i^2}{n} - \frac{\bar{x}^2}{n}\right]$$

where n is the weighted total number of cases in all c income classes.

p_i is the percentage of total cases in the ith income class.

x_i is the midpoint of the ith class.

$\bar{x}$ is the mean income of the distribution $\sum_{i=1}^{c} p_i x_i$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, R = 2,000 may be used. To obtain an estimated standard error for a mean income, find $\sigma_{\bar{x}}^2$ and take the square root.

Cross-classification of income and work experience data. This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person within a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey in order to eliminate the non matches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey. The remaining persons whose work experience data were assigned resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces included in the March survey are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference is due largely to the fact that the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

NONRESPONSES AND ALLOCATIONS

In the March 1972 CPS, no information was recorded for approximately 4 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 14 percent of all families and 10 percent of unrelated individuals 14 years old and over. Overall, about 10 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, Proceedings of the Social Statistics Section, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969.

Starting from the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) An expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missings earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969. See also "Current Developments in Collecting Income Data in the Current Population Survey," by Mitsuo Ono, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1971.

OTHER LIMITATIONS OF THE DATA

It is known that income data are usually underreported in household surveys, such as the Current Population Survey (CPS), when compared with aggregate benchmark estimates derived from administrative records. A number of articles on this general problem can be found in An Appraisal of the 1950 Census Income Data, Volume 23 of Studies in Income and Wealth, National Bureau of Economic Research, 1958. Another publication covering this same topic is The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States, prepared by T. Paul Schultz for use of the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964.

As noted previously, overall aggregate money income compiled in the CPS was about 88 percent of benchmark estimates in 1971. The proportion of aggregate income compiled in the CPS ranged from a low of 43 percent for property income to a high of 97 percent for wage and salary income. The proportion picked up for Social Security and railroad retirement payments was 81 percent while the comparable rate for public assistance was 71 percent. These rates were 95 and 66 percent for nonfarm and farm self-employment income, respectively. Benchmark estimates are compiled from data provided by the Bureau of Economic Analysis, Social Security Administration, Veterans' Administration, etc. For more details regarding the procedures to develop benchmark data, see the following: (1) "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in Studies in Income and Wealth, Volume 13, National Bureau of Economic Research, 1951, (2) "The OBE Size Distribution Series: Methods and Tentative Results for 1964," by Edward C. Budd and Daniel B. Radner, published in The American Economic Review,

Volume LIX, No. 2, May 1969, and (3) "The Creation of a Microdata File for Estimating the Size Distribution of Income," by Edward C. Budd, published in The Review of Income and Wealth, Series 17, Number 4, December 1971.

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contributions from nonhousehold members, (2) reluctance to reveal certain types of income types, e.g., public assistance, (3) rounding estimates, (4) misunderstanding the question, (5) lack of information, especially covering family members not present at the time of interview, (6) interviewers' errors, (7) processing errors, etc.

For more details on this topic of income underreporting in censuses and surveys, see: (1) Income Distribution in the United States (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) The Structure of Income, by Irving B. Kravis, University of Pennsylvania, 1962 and, (3) "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, as previously cited.

Table 1. SUMMARY MEASURES OF FAMILY CHARACTERISTICS, BY TOTAL MONEY INCOME IN 1971

NA NOT AVAILABLE.

[1] THE PERCENTAGE SHARES OF AGGREGATE INCOME FOR THE TOP 5 PERCENT OF FAMILIES FOR INCOME YEAR 1971 AND ALSO FOR OTHER YEARS ARE BEING COMPUTED USING REVISED PROCEDURES. BECAUSE OF THE INCOME LEVEL FOR THIS FRACTILE FALLING INTO BROADER INCOME INTERVALS THAN THOSE PREVIOUSLY UTILIZED, USE OF EARLIER TECHNIQUES WOULD RESULT IN INCONSISTENT AND ERRONEOUS ESTIMATES, PRIMARILY BECAUSE OF INTERPOLATION ERRORS. REVISED DATA WILL BE INCLUDED IN INCOME REPORTS TO BE PUBLISHED IN 1973. FOR MORE DETAILED EXPLANATION OF THIS PROBLEM, SEE PAGE 12 OF THE TEXT.

NOTE: ALTHOUGH THE CRITERIA FOR DEFINING METROPOLITAN AREAS ARE THE SAME AS FOR PREVIOUS YEARS, DATA FOR IN AND OUTSIDE METROPOLITAN AREAS AS SHOWN ABOVE ARE NOT COMPARABLE TO THOSE FOR PREVIOUS YEARS BECAUSE RESIDENCE STATUS, WITH RESPECT TO IN AND OUTSIDE METROPOLITAN AREAS, IS DETERMINED FROM 1970 CENSUS INFORMATION. PREVIOUSLY, RESIDENCE STATUS WAS DETERMINED FROM 1960 CENSUS INFORMATION.

[1]MEDIAN INCOMES SHOWN IN THIS TABLE WERE CALCULATED ON THE BASIS OF INCOME INTERVALS USED IN TABLE 44.

NOTE: ALTHOUGH THE CRITERIA FOR DEFINING METROPOLITAN AREAS ARE THE SAME AS FOR PREVIOUS YEARS, DATA FOR IN AND OUTSIDE METROPOLITAN AREAS AS SHOWN ABOVE ARE NOT COMPARABLE TO THOSE FOR PREVIOUS YEARS BECAUSE RESIDENCE STATUS, WITH RESPECT TO IN AND OUTSIDE METROPOLITAN AREAS, IS DETERMINED FROM 1970 CENSUS INFORMATION. PREVIOUSLY, RESIDENCE STATUS WAS DETERMINED FROM 1960 CENSUS INFORMATION. SEE TEXT FOR FURTHER INFORMATION.
