ACKNOWLEDGMENTS

This report was prepared by Emmett F. Spiers, Robert W. Cleveland, and George F. Patterson, assisted by Donald E. Larizza and John F. Coder of the Family and Individual Income Statistics Branch, Population Division. This report was prepared under the supervision of Mitsuo Ono, Chief of the Family and Individual Income Statistics Branch. Overall direction was provided by Murray S. Weitzman, Assistant Division Chief, (Socioeconomic Statistics Programs), Population Division.

SUGGESTED CITATION

U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 90, "Money Income in 1972 of Families and Persons in the United States," U.S. Government Printing Office, Washington, D.C., 1973.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, $3.05. Current Population Reports issued in Series P–20, P–23, P–25, P–26, P–27, P–28 (summaries only), P–60, and P–65 are sold as a single consolidated subscription at $14.00 per year, $3.50 additional for foreign mailing.

75. Percent of aggregate family income in 1972 contributed by the earnings of family members for husband-wife families in which both husband and wife had earnings, by race of husband by region of residence 161
76. Persons 18 to 24 years old by years of school completed, by total money income in 1972, by race and sex 162

MONEY INCOME IN 1972 OF FAMILIES AND PERSONS IN THE UNITED STATES

(Advance data on the 1972 income of families and persons were issued in June 1973 in Current Population Reports, Series P-60, No. 87)

Reflecting the resurgence of the economy, median family money income of the 54.4 million families in the United States climbed to $11,120 in 1972, an increase of 8.1 percent over the 1971 median family income of $10,290. Even after adjusting for increases in consumer prices, the estimated net gain in family purchasing power was still significant. The 1972 median family income rose approximately 4.6 percent over the 1971 median income in terms of 1972 constant dollars.

For families with heads who were year-round full-time workers, the median family income in 1972 was up by 8.7 percent over the 1971 median (in current dollars). These families, comprising about 64 percent of the 53.5 million families with civilian heads, had a 1972 median income of $13,520.

Both the increase in the number of families and in money income between 1971 and 1972 contributed to a solid advance in aggregate family income. Aggregate family money income increased by 11.2 percent between 1971 and 1972, stemming from a 2.0 percent increase in the number of families (1.1 million net additional families) and a 9.0 percent increase in average (mean) family income.

Table A. Number of Families and Unrelated Individuals by Total Money Income in 1972

(Families and unrelated individuals as of March 1973)

Total money income	Number of--	
	Families	Unrelated individuals
Total.....	54,373,000	16,811,000
Under $1,000.....	683,000	1,638,000
$1,000 to $1,999.....	1,183,000	3,030,000
$2,000 to $2,999.....	2,018,000	2,715,000
$3,000 to $3,999.....	2,494,000	1,749,000
$4,000 to $4,999.....	2,670,000	1,369,000
$5,000 to $5,999.....	2,735,000	1,144,000
$6,000 to $6,999.....	2,828,000	874,000
$7,000 to $7,999.....	3,030,000	889,000
$8,000 to $9,999.....	6,063,000	1,342,000
$10,000 to $11,999...	6,245,000	800,000
$12,000 to $14,999...	7,947,000	623,000
$15,000 to $19,999...	8,597,000	465,000
$20,000 to $24,999...	3,899,000	
$25,000 and over.....	3,982,000	174,000
Median income.....	$11,116	$3,521

Of the 54.4 million families (including families with civilian or military heads) in the United States as of March 1973, 4.0 million, or 7.3 percent, received incomes of $25,000 or more in 1972. There were 12.5 million families (23.0 percent) with incomes between $15,000 and $25,000; 14.2 million families (26.1 percent) with incomes between $10,000 and $15,000; 14.7 million families (27.0 percent) with incomes between $5,000 and $10,000; and 9.0 million families (16.6 percent) with incomes less than $5,000 in 1972.

The 1972 median income of the 5.3 million Negro families in the United States was $6,860, or about 59 percent of the $11,550 median income for white families. The 1972 median for Negro families increased by about 6.6 percent over the 1971 median of $6,440. (This increase amounted to 3.2 percent after allowing for the rise in consumer prices.) Among the 5.2 million Negro families with civilian heads, 50 percent were headed by year-round full-time workers. The median income of these families was $10,020, up 9.7 percent from 1971.

The 1972 median income for men working year round full time was $10,540; an increase of 9.4 percent over the 1971 median. Between 1971 and 1972, the median income for women working year round full time increased by 6.2 percent reaching a level of $6,050.

For income recipients in 1972, the median incomes of men and women were $7,450 and $2,600, respectively. The rate of increase between 1971 and 1972 for both medians was 7.9 percent.

These are some of the highlights obtained from the 1972 consumer income supplement conducted in March 1973 in connection with the Bureau's Current Population Survey (CPS). The survey covered the civilian noninstitutional population and 979,000 members of the Armed Forces living off post or with their families on post in the United States. The 1973 survey shows that there were about 206,304,000 persons, of whom 54,373,000 are family heads, 134,820,000 are other family members, and 17,111,000 are unrelated individuals, i.e., persons living alone or not related to others in the household including those under 14 years old.

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small

numbers of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. For further details, see below and page 24 of this report.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received before deductions for personal income taxes, Social Security taxes, union dues, Medicare premiums, etc. Money income is the sum of the amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families received nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Overall aggregate income compiled in the CPS was about 90 percent of preliminary benchmark estimates in 1972. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc. For further details, see page 24 of this report.

SELECTED INCOME CHARACTERISTICS OF FAMILIES IN 1972

Metropolitan-nonmetropolitan residence. In 1972, the median income for the 12.5 million families residing outside central cities of metropolitan areas of 1,000,000 or more population ($13,810) was about 31 percent higher than the median income of $10,520 for the 8.6 million families residing in central cities of these metropolitan areas. In smaller metropolitan areas (with less than 1,000,000 population), the median income for the 8.3 million families outside central cities was about 11 percent higher than that of the 7.5 million families domiciled in central cities. Data also show that the surburban families in larger metropolitan areas have higher income levels (about 16 percent greater) than suburban families in smaller metropolitan areas, $13,810 versus $11,920. Median income of families in nonmetropolitan areas lagged behind (about 21 percent less) the median income received by families in metropolitan areas, $9,480 versus $11,950. (See table 18.)

Type of family. In March 1973, approximately 46.3 million families had both a husband and wife present whereas 6.6 million families were headed by a woman. The median income of husband-wife families was $11,900 in 1972 as compared with a median income of only $5,340 for families headed by a woman. About 37 percent of the families headed by a woman had incomes below $4,000 in 1972 compared with only 8 percent for husband-wife families. The proportion of families in the lower income group which are headed by women has increased in recent years as the number of these families increased from 5.3 million in March 1968 to 6.6 million in March 1973, or a 24 percent increase. At the upper end of the income distribution, only 9 percent of families headed by a woman had incomes of $15,000 or more compared to 34 percent for husband-wife families.

The median income of Negro husband-wife families was $9,170 in 1972 or 76 percent that of the median income ($12,140) for white husband-wife families. The median income for Negro families headed by a woman was $3,840 or 62 percent of their white counterpart.

The median income in 1972 of husband-wife families with wife in the paid labor force was $13,900 or 32 percent higher than the median income ($10,560) for families in which the wife was not in the paid labor force. (See table 19.)

Educational attainment of head. It is well known that there is a strong positive relationship between educational attainment and income as the 1972 data continue to demonstrate. For example, although less than 1 percent (0.8) of all families (head 25 years old and over) received income of $50,000 or more, 4 percent of all families headed by a person completing 5 or more years of college received $50,000 or more. In contrast, only one-half of 1 percent of the families headed by a person completing his education at the high school level managed to reach this income bracket. The advantage of an advanced degree was further shown by the fact that nearly three in ten families whose head completed 5 or more years of college education had incomes of $25,000 or more while in families whose head had earned a bachelor's degree, about two in ten families received $25,000 or more. Only 6 percent of the families where the family head completed his education at the

high school level received $25,000 or more in 1972. In general, Negro families were less likely than white families to receive incomes of $25,000 or more regardless of the education level of the head. About 8 percent of white families, but only about 2 percent of black families were in this income range. Even among families whose head completed one or more years of college, white families with 19 percent receiving income of $25,000 or more outpaced Negro families with 8 percent receiving this income level. (See table 30.)

Work experience of head. Although more and more families derive their income through the efforts of both the family head and other family members, the work experience of the family head is still an important factor in shaping the level of family income. Of the 45.0 million family heads who worked during 1972, 34.3 million (or 76 percent) worked 50 to 52 weeks at full-time jobs while 3 percent worked year round at part-time jobs. In another 8.5 million families, the head did not work at all during 1972. The median income of families headed by a year-round full-time worker amounted to $13,520, about twice as much as that of families headed by a year-round part-time worker ($6,560). For families where the head did not work at all during 1972, median income was $4,840, or about 36 percent of the income of families headed by a year-round full-time worker. (See table 36.)

Source of income. In 1972, about 34 percent of all families were totally dependent upon income received from earnings, 56 percent obtained other types of income in addition to wages and salary and self-employment income, e.g., interest, dividends, rent, and pensions, and the remaining 10 percent indicated they only had income other than earnings. The median income of families relying on wages or salaries only was about $11,000 in 1972, as contrasted with the median of $12,650 for families reporting both wages or salary and income other than earnings. Families which derived their income solely from nonfarm self-employment had a median income of $8,510. Families receiving both nonfarm self-employment income and other income had a median income of $10,000 or about $1,500 higher than those depending on the income from their own nonfarm business alone.

About 42 percent of the families with incomes under $4,000 derived their income from unearned sources only. This proportion was only 6 percent for families in the $7,000 to $10,000 class, and about 1 percent for families at the $25,000 and over level. The median income in 1972 of families with no earnings was $3,940.

Between $4,000 and $12,000, the proportion of families with earnings only rose from 27 percent of all families in the $4,000 to $4,999 category to 42 percent in the $10,000 to $11,999 interval. However, as family income moves into higher intervals, there is a lesser dependence on earnings only. About 38 percent of families in the $12,000 to $14,999 bracket received earnings alone but for families with income of $50,000 or more, only 17 percent were dependent solely on earnings. (See table 43.)

GROWTH OF INCOME OF FAMILIES BETWEEN 1952 AND 1972

With the steady expansion of the United States economy over the past 20 years which included some years of cyclical interruptions, overall levels of money income received by families have risen, which in turn has induced further expansion in the economy by raising consumer demand for goods and services. Between 1952 and 1972, the level of median money income for families has nearly tripled, from $3,890 to $11,120, reflecting an average annual rate of increase of 5.4 percent in current dollar terms. Even after adjusting these money income gains for increases in overall consumer prices from 1952 to 1972, the estimated growth of real median money income for these units is still significant. In constant 1972 dollars, the average annual rate of increase in median family income from 1952 to 1972 was 3.0 percent. The continuation of this annual rate of increase would mean a doubling of the median family money income (after adjusting for price changes) within a period of about 25 years or a single generation.

In current dollar terms, the median family money income grew faster during the 1962 to 1972 period than the preceding period (1952 to 1962). The average annual rate of increase in median family income during the 1962-72 period was 6.5 percent, while for the 1952-62 period, it was 4.4 percent. However, because overall consumer prices also rose faster in the 1962-72 period than in the earlier decade, estimates of net gains in real median family income was about the same for both time periods - a 3.0 percent average annual increase.

The upward shift in the family income distribution during the past two decades has resulted in more families enjoying the benefits of higher family income and a general upgrading of standards of living. While the total number of families increased by 13.6 million families (from 40.8 million families in March 1953 to 54.4 million families in March 1973)[1], the number of families with $15,000

[1]Readers should note that while income data refer to the preceding year, the social and economic characteristics of families are as of March of the following year. See page 10 for further details.

or more, in constant 1972 dollars, increased by 14.4 million. In 1952, about 5 percent of all families had incomes of $15,000 or more but in 1972, the comparable percentage level was 30 percent. Correspondingly, the percentage of families with less than $4,000 (in constant 1972 dollars) was reduced by about one-half, from about 27 percent in 1952 to about 12 percent in 1972. The number of families with income of less than $4,000 was reduced from 10.6 million in 1952 to 6.4 million in 1972.

Although there are many reasons for this attainment of higher real income levels by American families during the past two decades, a significant portion of this rise in overall income levels can be attributed to the increased labor force participation rate of wives and the concurrent relative increase in the number of multiple earner families. Between 1952 and 1972, the overall rate of husband-wife families with wives in the paid labor force increased from about 23 percent to about 35 percent. Families in the income group of $15,000 and over have had the largest increase in the proportion of wives in the labor force, from about 33 percent in 1952 to about 50 percent in 1972.

Overall, between 1952 and 1972, the ratio of the number of families with two or more earners to all families increased from 41 percent to 53 percent. Concurrently, the comparable ratio for families with one earner dropped from about 53 percent to about 37 percent in the same time period.

Increases in the overall family income levels were accompanied by higher aggregate family income levels, resulting from increases in both the number of families and the level of mean income received by these families.[2]

---

[2] It should be noted here that money income data collected in household sample surveys such as the Current Population Survey are typically underreported, especially for families located at the two extremes of the income distribution. (See page 24 for further details.) Notwithstanding, it is still valid to depict in general terms, changes in the characteristics of families by different aggregate income levels and of families located in different fifths of families ranked by income.

Table B. Percent Distribution of All Families and Families With Incomes of $15,000 or More in 1952 and 1972 in Constant 1972 Dollars, by Selected Characteristics

Selected characteristics	Year			
	1972		1952	
	Total	Families with incomes of $15,000 or more	Total	Families with incomes of $15,000 or more
TYPE OF FAMILY

Other marital status	2.7	2.2	3.2	3.9
Female head	12.2	3.4	9.4	4.6
NUMBER OF EARNERS				
Total	100.0	100.0	100.0	100.0
No earners	9.9	0.8	6.2	0.6
1 earner	37.3	24.7	52.5	32.2
2 earners	39.2	46.2	32.6	43.7
3 earners or more	13.6	28.3	8.6	23.5

The level of aggregate family money income in 1972 was 270 percent greater than the level for 1952, the joint effect of a 33 percent increase in the number of families (from 40.8 million to 54.4 million families) and a 180 percent increase in the mean family income level during this period.

Among the 53.5 million civilian families in the United States (as of March 1973), about 11 percent were headed by persons of Negro and other races and these families accounted for about 7 percent of aggregate family money income in 1972. Although the ratio of the number of families of Negro and other races to all families did not change significantly over the last twenty years, data indicate that there were some improvements in the level of income received by families of Negro and other races between 1952 and 1972. The annual rate of growth in the mean income of families of Negro and other races (6.1 percent) was higher than for white families (5.2 percent).

In March 1973, about 32 percent of all families in the United States lived in the South and they accounted for about 29 percent of aggregate family money income in 1972. In March 1954 (the earliest year comparable data are available), the corresponding rates were about 30 percent and about 24 percent, respectively. Although the annual rate of expansion in the number of families in the South (1.8 percent) was lower than that for the West (2.7 percent), the mean income for families in the South had the highest annual rate of increase among the four regions between 1953 and 1972.

As previously noted, one of the outstanding changes that has taken place in the income structure of the American family has been the increase in the number of husband-wife families with working wives, from 9.1 million such families in 1952 to 18.9 million families in 1972. The number of these families increased at an annual rate of 3.7 percent while the mean family income for these families rose at an annual rate of 5.4 percent. As a result, the aggregate family money income received by these type of families has increased at an annual rate of growth of 9.3 percent during this period.

Data in table C also show that between 1952 and 1972, the number of families headed by younger persons (between ages 14 and 24 years) grew at an annual rate of 3.5 percent, the most rapidly growing family age group. The impact of this growth in the number of families in this age group and the 4.7 percent annual rate of increase in mean family income, has resulted in an 8.3 percent annual increase in aggregate family money income over this period.

Among families headed by persons in different occupational groupings, the highest annual rates of increase in aggregate family income between 1952 and 1972 were registered by family heads working as salaried professional, technical, and kindred workers, and as salaried managers and administrators. In both of these categories, the annual rate of increase in aggregate income between 1952 and 1972 was about 9 percent, attributable to both increases in the number of families and in the mean incomes received by these families.

In 1972, the highest and lowest fifth of families received 41.4 percent and 5.4 percent of aggregate income, respectively. In 1952, the corresponding percentage rates were 42.2 and 4.9 percent, respectively, not significantly different from those for 1972. (See table 16)

Although the percentage share of aggregate income received by each fifth of families ranked by income has remained fairly constant, the composition of the type of families included in these income groups has been changing over the past two decades. Thus, the lowest fifth in 1972 consisted of relatively fewer multi-earner families and relatively more families headed by nonworkers, and by women. This same group in 1952 was characterized essentially by families headed by persons with relatively low earnings, and by one-earner families residing to a large extent in farming areas. In 1952, for example, 75 percent of all families in the lowest fifth had one or more earners; the corresponding rate in 1972 was 64 percent. Also, in the lowest fifth, the percentage of families headed by women increased from 22 to 32 percent; nonworkers increased from 33 percent in 1957 (the earliest year for which comparable data are available) to 47 percent in 1972.

The composition of families in the highest fifth group also changed between 1952 and 1972. The proportion of families with heads of Negro and other races increased from 3 percent in 1952 to 5 percent in 1972 and families with 3 or more earners increased from 20 to 29 percent in the same period. Moreover, in this category, families receiving both earnings and income other than earnings increased from 30 percent to 73 percent.

In summary, these data show that families in the United States have experienced a marked upward trend in money income levels in both current and constant dollar terms over the past two decades. Although this rise in average family money income was accompanied by a major shift of families upward along the entire income distribution, the relative percentage shares of aggregate family income showed no significant changes. However, these data indicate that the general improvement in the income structure of American families was associated with some modifications in the composition of families with different social and economic characteristics at varying income levels.

Table C. Number of Families and Mean and Aggregate Family Income in 1952 and 1972, by Selected Characteristics

Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 89. A cross reference of tables contained in this report with comparable tables included in other reports in the P-60 Series can be obtained by writing to Meyer Zitter, Chief, Population Division, Bureau of the Census, Washington, D.C. 20233. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the Special Labor Force Reports of the Bureau of Labor Statistics. Series P-23, No. 39 "Differences Between Incomes of White and Negro Families by Work Experience of Wife and Region: 1970, 1969, and 1959" contains data comparable to tables 67 to 70 and 73 included in this report. Series P-60, No. 87, "Money Income in 1972 of Families and Persons in the United States" contains advance 1972 income data cross-classified by various characteristics. Series P-60, No. 89 "Household Money Income in 1972 and Selected Social and Economic Characteristics of Households" contains 1972 income data on households. For a detailed analysis of the low income population in 1971, in the United States, see Series P-60, No. 86. Series P-60, No. 88 contains advance data on the low income population in 1972.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Decennial censuses. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, Sources and Structures of Family Income; 8B, Earnings by Occupation and Education; and 8C, Income of the Farm-Related Population. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the 1970 Census of Housing. Reports of the 1960, 1950, and 1940 Censuses also contain various statistics on income.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the black population and the population of Spanish origin.

Statistics on income in 1969 collected in the Current Population Survey (CPS) of March 1970 differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances. In the first place, the CPS data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self enumerated in the 1970 Census. Moreover, income data in the CPS are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within four of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median family income reported in the 1970 census was about $9,590, 1.7 percent above the comparable figure of $9,433 derived from the March 1970 Current Population Survey. This difference is smaller than the difference of 4.5 percent between the medians compiled from the 1960 census and the March 1960

Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, published in the American Statistical Association Proceedings of the Social Statistics Section, 1972.

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 979,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm. However, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

For detailed information on the effect of the above definitional change, see Series P-60, No. 35, pages 10 and 11.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

The figures shown in this report for standard metropolitan statistical areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's defined on the basis of the 1960 census. The median income in 1969 of families residing in metropolitan areas based on the 1970 definitions and procedures is 0.5 percent lower than that based on the 1960 definitions and procedures. This difference arises partly as a result of the inclusion of new and smaller SMSA's with lower income relative to previously defined SMSA's. The median incomes of men and women were 0.3 percent and 1.5 percent lower, respectively, based on the 1970 census definitions relative to those based on the 1960 census definitions.

Central cities. The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

   a. The additional city or cities have at least 250,000 inhabitants.

   b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Mississippi, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Arizona, Colorado, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Alaska, and Hawaii.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) dividends, interest (on savings or bonds), income from estates or trusts, or net rental income; (6) public assistance or welfare payments; (7) unemployment and workmen's compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 was coded as $15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Overall aggregate income compiled in the CPS was about 90 percent of preliminary benchmark estimates in 1972. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc. For further details, see page 24 of this report.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not

State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties, include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Public assistance or welfare payments include public assistance payments such as old age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings--the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment; and

Income other than earnings--the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under $1,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment,

income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The median incomes as shown in this report are calculated from the corresponding income size distributions by linear interpolation within the income interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median. Thus, the median family incomes greater than $10,000 as shown in tables 20 and 68 differ from corresponding medians shown in tables 18 and 21, respectively, because of interpolation differences. For example, median family income for all families as shown in table 20 is $11,048 or 0.6 percent lower than the comparable median of $11,116 as shown in table 18. The median for white families as shown in table 68 is $11,518, 0.3 percent lower than the comparable median of $11,549 as shown in table 18.

In general, the median income values are calculated based on the intervals in the table which contains the medians, with the exception of the tables in the "Trends in Family Income" section and table 45. The medians for 1972 shown in the "Trends in Family Income" section are based on the intervals shown in table 18, while the medians presented in tables 45, 58, 61, and 62 are based on the intervals shown in table 46. The medians shown in table 68 are based on the intervals shown in table 20.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, hospitals, homes for nurses, convents, monasteries, and ships.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals. The term "primary family" refers to the head of a household and all other persons in the household related to

the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual. A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Married couple. A "married couple" is a husband and his wife enumerated as members of the same household or group quarters. In table 48 the category "married couples 62 years old and over" includes all couples of which either member is 62 years old and over. In the P-20 reports on Household and Family Characteristics married couples are classified by the age of the husband only.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation, class of worker, and employment status in tables 35, 52, 61, 62, 70, and 73, refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, class of worker, and industry in tables 34, 39 to 41, and 57 to 60 refer to the job held longest during the income year.

In several tables two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession, or trade, for profit or fees. Included in the self-employed groups in these tables are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings included in the 1971 and 1972 income reports were based on the classification systems used in the 1970 Census of Population. These groupings, with minor differences in the group titles, were also used in the 1970 income report containing data compiled from the March 1971 survey. Between the 1970 and 1969 income reports which included data obtained from the March 1971 and March 1970 surveys, respectively, there were changes in the industry and occupation classification systems. The income reports from 1961 through 1969 utilized the 1960 census classification systems. However, beginning with the 1970 income reports, the 1970 census systems were used. For major groupings, especially for the industrial groupings, there is relatively little difference in comparability between the systems used in the 1960 and 1970 Censuses of Population. A detailed comparison of these two systems can be found in the Bureau of the Census Technical Paper 26, 1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements. Additional information may be obtained from a paper, "Changes Between the 1960 and 1970 Census of Population" by Stanley Greene and John Priebe presented at the August 1972 American Statistical Association meeting held in Montreal, Canada. Also see "Revisions in Occupational Classifications for 1971" by John E. Bregger in Employment and Earnings, Volume 17, No. 8, page 5, published by the Bureau of Labor Statistics, United States Department of Labor.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "craftsmen").

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. An estimate of the size of the base (number of units) of each percent distribution by income in 1972 is shown in most of the tables in this report. The base figures shown in this report for 1971 and 1972 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census. A more detailed description of this change can be found in an article entitled "Revisions in Current Population Survey" Employment and Earnings, Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

Computation of aggregate income by fifths. In calculating aggregate income by fifths (or for the top 5 percent), from 1958 to the present, the following procedure was followed:

1. Rank the number of units (families or unrelated individuals as applicable) by size of total money income.

2. Determine the income cutoffs for each fifth (and top 5 percent by summing the units in order from the unit with the lowest income to the unit with the highest income up to and including the unit which just causes the sum of units to equal the number of units below the relevant percentile; and selecting as the upper income cutoff for this percentile the unit which causes the sum of units to equal the number of units below the relevant percentile.

3. Determine the aggregate income in a particular fifth by summing the aggregate incomes of all units corresponding to those units included below the percentile cutoff as determined in step 2 and subtracting the aggregate income for the units in the next lower percentile. The aggregate income for the top 5 percent was determined by subtracting the aggregate income of all units below the ninety-fifth percentile from the total aggregate income for all units.

4. And, finally, calculate the percent distribution of aggregate income.

In calculating the aggregate income by fifths and the top 5 percent for 1958 and all previous years (data for 1958 was calculated both ways), the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For income intervals below $15,000, the midpoint of each class interval was used. (Note: Before calculating the aggregate income distributions, all income intervals below $15,000 which were greater then $1,000 in width were split into $1,000 intervals by interpolation assuming that incomes within the wider interval were distributed according to a Pareto distribution. The midpoints were then calculated based on these smaller income intervals.) A value of $19,000 was used for the $15,000 to $24,999 interval. For the $25,000 and over interval, the estimate of the mean was calculated based on a Pareto Curve fitted to the number of units in the $15,000 to $24,999 interval.

The upper income level of a particular fifth of units ranked by income was estimated by cumulating the number of units in successive income intervals and by interpolating linearly within the income interval in which the fifth falls (designated the reference interval). After determining the upper income level for this fifth, the aggregate income below this income level was estimated by multiplying the midpoint for the interval between the upper income level of the fifth and the lower income level of the reference interval for this fifth by the number of units within this segment and adding the result obtained to the total aggregate income below the reference interval. The aggregate income for a particular fifth was determined as a residual by subtracting the aggregate income below the next lower fifth from the aggregate income below the particular fifth.

For a more detailed description of the method of computing aggregate income by fifths, for 1947 through 1958, see Technical Paper No. 8, Trends in the Income of Families and Persons in the United States: 1947 to 1960, pages 16 to 26, or its revision, Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964.

The following assumptions were used in the above procedures for 1947 through 1958:

1. In subdividing the income intervals below $15,000, the interpolation was made using a Pareto estimation technique.

2. In estimating the mean income per income interval, midpoints and the Pareto estimation techniques were used.

3. In finding the upper levels of each fifth, a linear interpolation technique was used, and

4. In obtaining the mean income of the subinterval between the upper level of the fifth and the lower level of the reference interval, midpoints were used as a proxy for mean income.

Computation of constant-dollar distributions. The adjustment for price change was made by converting the income distribution for families and unrelated individuals for each year (1947 through 1971) into 1972 dollars on the basis of the change in the Consumer Price Index. The first step required the subdivision of broad income intervals, such as $7,000 to $9,999 and $10,000 to $11,999, into smaller intervals to provide a more refined basis for interpolation to convert to constant dollars. This subdivision was accomplished from generalized tables that were prepared from Pareto Curves that were fitted to frequency distributions having varying degrees of concentration in the open-end limits.

After the detailed frequency distributions were obtained, the procedure was then to convert the limits of each income interval into 1972 dollars adjusted by a factor representing the change on the basis of that year's price index (1972 = 100); next, to compute by interpolation the number of families and unrelated individuals in each of the detailed class intervals; and then to combine the estimates into broad income brackets.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices have not been developed for families in different income class intervals. Neither did the available data permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data cover also family savings and income tax payments. For these and other reasons, the constant-dollar figures, particularly in the income range over $10,000, are to be regarded as approximations.

The constant-dollar distributions in table 10 were obtained by applying the same procedures as used for the Country as a whole to the current-dollar family income for each region. Previous studies indicated that regional price indices differed only slightly from the U.S. Index. The limitations noted earlier for the United States distributions in terms of constant dollars apply also to the regional distributions. It should also be noted that the adjustments for price change have been introduced in order to measure changes in real incomes within a region over time, and that they have limited use for the purpose of interregional comparisons. The available consumer price indices measure the relative change in price levels in each region and make possible a comparison of the relative changes of constant-dollar income between regions. These indices do not, however, reflect geographical differentials in price levels and do not, therefore, make it possible to compare the absolute levels of constant-dollar income between regions.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Social and Economic Statistics Administration of the Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition. The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind

account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data. The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 98 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. Population coverage. The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. Average income. The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based

on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Surveys of Consumer Finances. The Survey of Consumer Finances, which was conducted annually through 1971 by the Survey Research Center of the University of Michigan, provided, among other data, information on the size distribution of income. These Surveys were based on nationwide samples that covered all persons in private households. Several important differences between the Survey of Consumer Finances and the present report may be noted:

1. The income-receiving unit in the Survey of Consumer Finances was the family unit, including two or more people living in the same dwelling unit and related to each other by blood, marriage, or adoption or a single person living alone or unrelated to the other occupants in the dwelling unit. However, the data included in the Current Populatiion Report, P-60 series, relate to persons 14 years old and over and to families and unrelated individuals, separately.

2. The Survey of Consumer Finances estimates were based on a sample which was different from and also smaller (approximately 2,600 family units in 1970 and 1,300 in 1971) than the CPS sample. Differences between the results are subject to sampling variability arising from each survey. This factor alone could account for some discrepancies between the two sets of data.

3. There are some differences in the estimating procedure. The Bureau of the Census inflated its weighted sample results to agree with independent estimates of the civilian population of the United States by age, race, and sex, whereas the Survey of Consumer Finances weighted sample results were inflated to agree with independent estimates of occupied dwelling units.

4. Only eight income questions are asked for each person in the Bureau of the Census sample whereas numerous detailed questions on income and other financial items are asked of the head of the spending unit and all other members in the spending unit in each household in the Survey of Consumer Finance sample.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $2,050 (less than $2,800 if 65 years old or over) and married couples receiving less than $2,880 ($3,550 if one spouse is 65 years old or over; $4,300 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of $9,000 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained in the March 1973 Current Population Survey of the Bureau of the Census. The sample was spread over 461 areas comprising 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately

47,000 occupied households were eligible for interview each month. Of this number 2,000 occupied units, on the average, were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. In addition to the 47,000 there were also about 8,000 sample units which were visited but were found to be vacant or otherwise not to be interviewed.

The estimating procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that all members of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables D, E, F, G, H, and I are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Tables D and E show the standard errors of the estimated numbers of total or white families and persons in a given category. Tables F and G show the standard errors of the estimated numbers of families and persons of Negro and other races in a given category.

Table D. Standard Errors of Estimated Numbers of All Families and White Families

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	5,000.....	66
250.....	16	10,000.....	88
500.....	22	25,000.....	112
1,000.....	31	50,000.....	158
2,500.....	48		

Table E. Standard Errors of Estimated Numbers of All Persons and White Persons

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	5,000.....	86
250.....	20	10,000.....	119
500.....	28	25,000.....	178
1,000.....	39	50,000.....	224
2,500.....	61	100,000.....	218

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding

absolute estimates of the numerators of the percentages, particularly if the percent is large (50 percent or greater).

Table F. Standard Errors of Estimated Numbers of Families of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	1,000.....	26
250.....	14	2,500.....	34
500.....	20	5,000.....	48

Table G. Standard Errors of Estimated Numbers of Persons of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	2,500.....	54
250.....	18	5,000.....	69
500.....	26	10,000.....	72
1,000.....	36		

Table H shows the standard errors of the estimated percentages of families in a given category. Table I shows the standard errors of the estimated percentages of persons.

Illustration of use of the table of standard errors of percentages. Table 31 shows that an estimated 9.2 percent of families with three earners had an income of $10,000 to $11,999 in 1972. Since the base of this percentage is 5,147,000 families with three earners, interpolation in table H shows that the standard error of the estimated 9.2 percent is approximately 0.4 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.4 percent. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.8 percent. That is, this 95 percent confidence interval would range from 8.4 to 10.0 percent.

Difference between two sample estimates. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristics in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will over-estimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 31 of this report shows that in 1972 and estimated 6.7 percent of families with three earners had an income of $8,000 to $9,999. Thus, the apparent difference in the percentage of families with three earners with incomes of $10,000 to $11,999 and $8,000 to $9,999 is 2.5 percentage points. The standard error of 9.2 percent is approximately 0.4 percent, as shown above. Table H shows the standard error of 6.7 percent on a base of 5,147,000 families to be approximately 0.3 percent. The standard error of the estimated difference of 2.5 percent is about $0.5 = \sqrt{(0.4)^2 + (0.3)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the sample would differ from the difference derived using complete census figures by less than 0.5 percentage points. The 68 percent confidence interval around the 2.5 percent difference is from 2.0 percent to 3.0 percent, i.e., 2.5 percent $\pm$ 0.5 percent. A conclusion that the average estimate of the change derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 1.5 percent to 3.5 percent and thus we can conclude with 95 percent confidence that the proportion of families with three earners with an income in 1972 of $10,000 to $11,999 is actually greater than the proportion with an income of $8,000 to $9,999.

Medians. The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base.

Confidence limits of a median based on sample data may be estimated as follows: (1) From table H or I using the appropriate base, determine the standard error of a 50-percent characteristic, (2) add to and subtract from 50 percent the standard error determined in step (1), and (3) the confidence interval for the median corresponding to the two points established in step (2) are then read off the distribution of the characteristic. A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table H or I.

Table H. Standard Errors of Estimated Percentages of Families

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)								
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000
2 or 98	1.4	0.9	0.6	0.4	0.3	0.2	0.1	0.1	0.1
5 or 95	2.1	1.4	1.0	0.7	0.4	0.3	0.2	0.1	0.1
10 or 90	3.0	1.9	1.4	1.0	0.6	0.4	0.3	0.2	0.1
25 or 75	4.3	2.7	1.9	1.4	0.9	0.6	0.4	0.3	0.2
50	5.0	3.0	2.3	1.6	1.0	0.7	0.5	0.3	0.3

Table I. Standard Errors of Estimated Percentages of Persons

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
2 or 98	1.7	1.1	0.8	0.5	0.3	0.2	0.2	0.1	0.1	0.1
5 or 95	2.7	1.7	1.2	0.9	0.5	0.4	0.3	0.2	0.1	0.1
10 or 90	3.7	2.3	1.7	1.2	0.7	0.5	0.4	0.2	0.2	0.1
25 or 75	5.4	3.4	2.4	1.7	1.1	0.8	0.5	0.3	0.2	0.2
50	6.2	3.9	2.8	2.0	1.2	0.9	0.6	0.4	0.3	0.2

Illustration of the computation of the standard error of a median. The median income of families with five children was $10,405 in 1972 (Table 21). There were an estimated 1,163,000 families of this type.

1. From table H, the standard error of 50 percent of these families expressed as a percentage is about 1.5 percent.

2. As we usually are interested in the confidence interval for the median at the two-standard-error level, we add and subtract twice the standard error obtained in step (1). This yields percentage limits of about 47.0 and 53.0.

3. Since 41.0 percent of these families had incomes below $9,000 and 6.5 percent had incomes between $9,000 and $9,999, the dollar value of the lower limit may be found by linear interpolation to be:

$$\frac{47.0 - 41.0}{6.5} \times \$1{,}000 + \$9{,}000 = \$9{,}923.$$

Since 47.5 percent of these families had incomes below $10,000 and 11.6 had incomes between $10,000 and $11,999, the dollar value of the upper limit is found to be:

$$\frac{53.0 - 47.5}{11.6} \times \$2{,}000 + \$10{,}000 = \$10{,}948$$

The 95 percent confidence interval is $9,923 to $10,948.

Table J contains 68 percent and 95 percent confidence intervals for various medians of differing magnitudes and bases. A 68 percent confidence interval is defined such that if many samples are taken and a one-standard-error confidence interval is formed for each sample median, about 68 out of 100 of these intervals will contain the median which would be found if a complete census were taken. For a two-standard-error confidence interval, about 95 out of 100 of the intervals formed would contain the census median.

Approximation of the standard error of the mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}}^2 = R\left[\frac{\sum_{i=1}^{c} p_i x_i^2}{n} - \frac{\bar{x}^2}{n}\right]$$

where n is the weighted total number of cases in all c income classes.

p_i is the percentage of total cases in the ith income class.

x_i is the midpoint of the ith class.

$\bar{x}$ is the mean income of the distribution $\sum_{i=1}^{c} p_i x_i$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, R = 1,650 may be used. To obtain an estimated standard error for a mean income, find $\sigma_{\bar{x}}^2$ and take the square root.

Table J. Sampling Variability of Selected Medians

Table and characteristics of families and persons	Base (thousands)	Median income	Confidence interval	
			68 percent	95 percent
FAMILIES				
Table 18				
Race:				
White	48,477	$11,549	$11,499 - $11,600	$11,448 - $11,651
Negro	5,265	6,864	6,759 - 6,970	6,653 - 7,071
Residence:				
Farm	2,513	8,849	8,674 - 9,030	8,495 - 9,193
Nonfarm	51,860	11,225	11,173 - 11,277	11,121 - 11,329
Table 19				
Head 65 years and over:				
White	6,902	6,133	6,054 - 6,208	5,982 - 6,286

[1]Limited to families with head 25 years old and over.
[2]Limited to persons 25 years old and over.

Cross-classification of income and work experience data. This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person within a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey in order to eliminate the non matches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey. The remaining persons whose work experience data were assigned resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces included in the March survey are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference is due largely to the fact that the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

NONRESPONSES AND ALLOCATIONS

In the March 1973 CPS, no information was recorded for approximately 5 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 17 percent of all families and 12 percent of unrelated individuals 14 years old and over. Overall, about 12 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, Proceedings of the Social Statistics Section, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making

individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969.

Starting from the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) An expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missings earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969. See also "Current Developments in Collecting Income Data in the Current Population Survey," by Mitsuo Ono, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1971.

OTHER LIMITATIONS OF THE DATA

It is known that income data are usually underreported in household surveys, such as the Current Population Survey (CPS), when compared with aggregate benchmark estimates derived from administrative records. A publication covering this general topic is The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States, prepared by T. Paul Schultz for use of the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964.

As noted previously, overall aggregate money income compiled in the CPS was about 90 percent of benchmark estimates in 1972. (See table K). The proportion of aggregate income compiled in the CPS ranged from a low of 45 percent for property income to a high of 98 percent for wage and salary income. The proportion picked up for Social Security and railroad retirement payments was 92 percent while the comparable rate for public assistance was 70 percent. These rates were 99 and 65 percent for nonfarm and farm self-employment income, respectively. Benchmark estimates are compiled from data provided by the Bureau of Economic Analysis, Social Security Administration, Veterans' Administration, etc. For more details regarding the procedures to develop benchmark data, see the following: (1) "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in Studies in Income and Wealth, Volume 13, National Bureau of Economic Research, 1951, (2) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contributions from nonhousehold members, (2) reluctance to reveal certain types of income types, e.g., public assistance, (3) rounding estimates, (4) misunderstanding the question, (5) lack of information, especially covering family members not present at the time of interview, (6) interviewers' errors, (7) processing errors, etc.

For more details on this topic of income underreporting in censuses and surveys, see: (1) Income Distribution in the United States (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) The Structure of Income, by Irving B. Kravis, University of Pennsylvania, 1962 and, (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" cited earlier in this section.

Table 18. TYPE OF RESIDENCE AND RACE—FAMILIES AND UNRELATED INDIVIDUALS BY TOTAL MONEY INCOME IN 1972

(Families and unrelated individuals as of March 1973. This report excludes inmates of institutions. It includes members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces; the 1973 survey includes about 979,000 members)

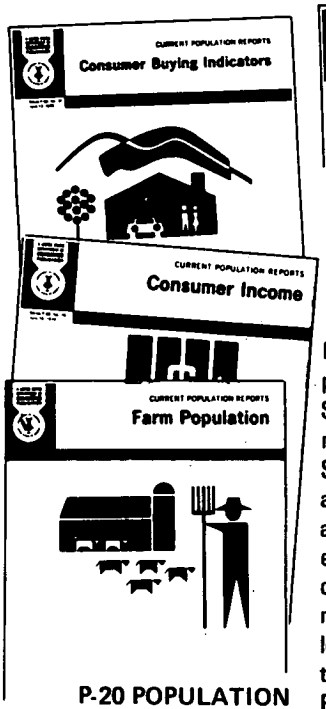
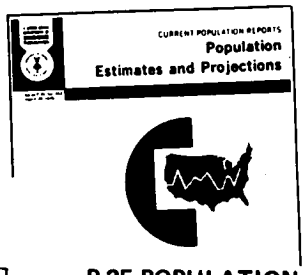
CURRENT POPULATION REPORTS

In addition to the findings of the Census of Population, conducted every 10 years, the Bureau of the Census publishes continuing and up-to-date statistics on population counts, characteristics, and other special studies on the American people. Data are issued in the eight separate series of reports described herein and released under the general title, Current Population Reports.





P-20 POPULATION CHARACTERISTICS. Current national and, in some cases, regional data on geographic residence and mobility, fertility, education, school enrollment, marital status, numbers and characteristics of household and families, etc. Approximately 10 reports each year.

P-23 SPECIAL STUDIES. Infrequent reports on methods, concepts, or specialized data.

P-25 POPULATION ESTIMATES AND PROJECTIONS. Monthly estimates of the total population of the United States; annual mid-year estimates of the population of States, by broad age groups, and of the United States by age, color, and sex; annual estimates of the components of population change. Estimates of the population selected metropolitan areas and their component counties. Projections of the future population of the United States and individual States. Approximately 20 reports each year.

P-26 FEDERAL-STATE COOPERATIVE PROGRAM FOR POPULATION ESTIMATES. Population estimates for counties for selected States in which the figures are prepared by a State agency as part of the Federal-State Cooperative Program for Local Population Estimates.

P-27 FARM POPULATION. (Census-ERS). Data on the size and selected characteristics of the farm population of the United States. Issued jointly with the Economic Research Service, U.S. Department of Agriculture. One or two reports each year.

P-28 SPECIAL CENSUSES. Results of population censuses taken at the request and expense of city or other local governments. Subscription includes only the quarterly and annual summaries showing the total population figures for all the censuses conducted during the particular period. Individual reports issued for areas of 50,000 or more, showing the population by age, sex, and color are available separately. See "How to Order Reports." Five reports each year.

P-60 CONSUMER INCOME. Information on the proportions of families and persons at various income levels. Also data on the relationship of income to age, sex, color, family size, education, occupation, work experience, and other characteristics. Two reports each year.

P-65 CONSUMER BUYING INDICATORS. Information on household ownership and recent purchase of cars, trucks, and selected household equipment. Ownership and purchase data are shown by income, age of head, residence, race, and other household characteristics. Annually.

HOW TO ORDER REPORTS

All Current Population Reports are sold as a single subscription for $30.50 a year (add $7.75 for foreign mailing). Price includes Series P-20, P-23, P-25, P-26, P-27, P-28 (quarterly and annual summaries only), P-60, and P-65.

Subscriptions to individual series are not sold separately, but single copies of reports issued in all series except P-28 may be obtained from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Individual city or area reports in the P-28 series may be ordered from the Social and Economic Statistics Administration—prices vary. For information on CP reports, write to Publications Distribution Section, Social and Economic Statistics Administration, Washington, D.C. 20233.
