ACKNOWLEDGMENTS

This report was prepared by Mary F. Henson, staff member, under the supervision of Mitsuo Ono, Chief of the Family and Individual Income Statistics Branch. Statistical assistance was provided by Gloria A. Thomas. Overall direction was provided by Murray S. Weitzman, Assistant Division Chief, (Socioeconomic Statistics Programs), Population Division. The computer programs for the tabulation of data in tables 9 through 29 were prepared by Richard A. Hornseth, Chief, Special Tabulations Programming Staff, Data User Services Office.

SUGGESTED CITATION

U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years, 1956 to 1972," U.S. Government Printing Office, Washington, D.C., 1974.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, $2.10. Current Population Reports issued in Series P-20, P-23, P-25, P-26, P-27, P-28 (summaries only), P-60, and P-65 are sold as a single consolidated subcription at $30.50 per year, $7.75 additional for foreign mailing.

27. Expected lifetime income for male year-round full-time workers 18 to 64 years old with income in 1968, by years of school completed, age, selected discount rates, and selected annual productivity increase (in 1972 dollars) 96
28. Expected lifetime income for male year-round full-time workers 18 to 64 years old with income in 1967, by years of school completed, age, selected discount rates, and selected annual productivity increase (in 1972 dollars) 100
29. Males 18 to 64 years old: Deduction from expected lifetime income to be made for an annual allowance of $1,000, $2,000, $3,000, and $4,000 for personal maintenance, by present age 104

Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years, 1956 to 1972

INTRODUCTION

This report presents educational attainment and income data for selected years from 1956 to 1972 assembled from information collected in the Current Population Survey. It updates the information previously published for the period up to 1968 in Current Population Reports, Series P-60, No. 74 and No. 56. Educational attainment estimates in this report are limited to men with income and accordingly differ slightly from general education statistics relating to all men which are presented in table F. Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers. In addition, procedures used to prepare lifetime income estimates, definitions and explanations of terms, and sources of data are included.

Prior to 1967, mean incomes and lifetime income estimates were computed on grouped data.[1] However, improved methodology introduced in 1967 permits the computation of data based on the use of actual income amounts in preparing the estimates. Therefore, for the years 1967 and 1968, lifetime income estimates and mean incomes of men are based on both grouped and ungrouped data to illustrate the differences engendered by the two estimation procedures. For more detailed explanation, see Current Population Reports, Series P-60, No. 74, "Annual Mean Income, Lifetime Income, and Education Attainment of Men in the United States, For Selected Years, 1956 to 1968," pages 20 to 22. It should be noted that since the estimates are based on a sample, they are subject to sampling variability. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. Data on consumer income collected by the Bureau of the Census cover money income only (exclusive of certain money receipts such as capital gains) prior to deduction for taxes.

Mean Income and Educational Attainment

The educational attainment of the male population in the United States has increased considerably during the past 16 years. In March 1973, the median years of school completed by men 25 years old and over was 12.3 years, or about the equivalent of a high school education, whereas in March 1957 it was 10.4 years (table F). Between March 1957 and March 1973, the proportion of males who terminated their schooling after 4 years of high school increased by about two-fifths and the proportion of males completing 4 or more years of college rose by two-thirds. As can be expected, there was a reduction in the proportion of men who terminated their schooling with elementary school, dropping from about 19 percent in March 1957 to roughly 12 percent in March 1973.

Although a large proportion of men end their formal education with a high school diploma, there has been an upward trend in the proportion of males completing their schooling beyond high school. In March 1959, about 8 percent of the 46.3 million males 25 years old and over had completed 1 to 3 years of college and in March 1973, about 12 percent of the 53.1 million males had attained this level of schooling--a gain of 48 percent. Between March 1959 and March 1973, men completing their formal education with a bachelor's degree rose from 6 percent to 9 percent. A relative gain was registered by men with post graduate studies completed. Men completing 5 or more years of college rose from 4 percent in March 1959 to 7 percent in March 1973.

In step with the rise in the educational attainment level of the male population in the United States, there has been significant changes in mean incomes received by men over the past 16 years. Thus, the mean income of all men 25 years old and over increased by 49 percent, from $6,800 in 1956 (in constant 1972 dollars) to $10,120 in 1972. An important factor in this increase is that more and more males are continuing their schooling which in turn provides the opportunity to enter into skilled occupations yielding higher income returns.

Although the mean income in terms of constant dollars for all men 25 years old and over rose from $9,600 in 1971 to $10,120 in 1972, a gain of about $520 or 5 percent, gains were recorded for men in the 35 to 44 year age group. The mean income of men 35 to 44 years old was $12,170 in 1972, $800 higher than the $11,370 mean income in 1971.

Table A shows that there is a progressive increase in income associated with each level of schooling. In 1972, men 25 years old and over who completed elementary school had a mean income of $6,760 or $1,520 more than men who started but did not finish elementary school. Male high school graduates reported a mean in-

[1]Estimates based on a series of estimated mean values for specific income class intervals. The mean income was obtained from a summation of the product of the average income and the proportion of males for each income level.

[1]Improved methodology introduced in 1967 permits the computation of data based on actual reported amounts.

[2]Estimates based on a series of estimated mean values for specific income class intervals.

come of $10,430, or $1,980 higher than high school nongraduates. Males who continued their education through the college level can expect to receive considerably higher incomes than males who terminate their schooling after 1 to 3 years of college training. The mean income of men who completed 4 or more years of college was $16,200 in 1972, $4,330 higher than the mean income of men who started college but did not graduate. The income differential of graduates versus nongraduates also existed by age group.

There are monetary gains associated with successfully achieving each identifiable educational plateau. Men 25 years old and over whose education terminated after 4 years of high school received a mean income of $10,430 in 1972, or $3,680 more than men whose formal schooling ended at the eighth grade level. Men with college degrees received a mean income of $16,200, $5,770 or 55 percent higher than men whose education terminated after receiving their high school diplomas.

Of the 6.9 million males 25 years old and over in the "$1 to $2,999 or loss" class interval in 1972, 19 percent completed elementary school, another 17 percent completed high school, and about 7 percent completed 4 or more years of college. In contrast, of the 9.1 million males in the "$15,000 and over" class interval, about 4 percent completed their schooling with the eighth grade, another 29 percent concluded their education with a high school diploma and 42 percent received a college degree. The median years of school completed was 8.7 years for males 25 years old and over with incomes less than $3,000, and for males in the highest income interval--$15,000 and over--the median years of school completed was the equivalent of college experience--14.6 years.

Table E indicates that younger men (25 to 34 years old) have the highest levels of schooling completed. The median years of school completed for these men was 12.7 years in 1972, compared to about 8.7 years for men 65 years old and over. The median years of school completed for younger men in the lowest income interval was 4.3 years higher than for older men--12.4 years and 8.1 years, respectively. However, this difference in years of school completed dropped to 2.5 years for males in the $15,000 and over interval--from 15.4 years to 12.9 years.

The mean income of males completing just 4 years of college was lowest for the younger and older age groups--averaging about $11,500 in 1972--indicating that the younger age group (25 to 34 years old) is completing their formal education before entering the labor force and that the older age group (65 years old and over) is retiring from the labor force. The income differential between the younger and older men and those in the middle age bracket was substantial, where the mean income was $17,480 for men 35 to 44 years old; $19,410 for men 45 to 54 years old; and $17,200 for men 55 to 64 years old. Even for males completing their post graduate studies, which is usually done while being gainfully employed in the labor force, the income differentials was still substantial.

In addition to education, work experience is also an important variable closely associated with income. Among the 52.6 million men 25 years old and over with income in 1972, 66 percent were year-round full-time workers. In 1972, the mean income ($12,350) of men 25 years old and over working year round full time was 22 percent higher than for all men with income. This difference varied by age groupings. The difference was especially great when mean incomes of men 65 years old and over were compared against each other. Thus, in the 65 years old and over group, the mean income ($10,550) of male year-round full-time workers was 96 percent higher than that ($5,380) of all men with income in this age group. In contrast, the comparable ratio was only about 9 percent higher for men in the 35 to 44 year age group.

The mean income of male high school graduates 25 years old and over working 50 to 52 weeks in 1972 was $11,570, or 27 percent higher than elementary school graduates with comparable work experience. Similarly, men completing 4 or more years of college had a mean income of $17,880, $6,310 or 55 percent higher than high school graduates. Among men working 50 to 52 weeks and who were college graduates the mean income of those men with 5 or more years of schooling was $18,980, $2,010 or 12 percent higher than those men with 4 years of schooling ($16,970).

Between 1967 and 1972, the mean income (in terms of constant dollars) of male year-round full-time workers 25 years old and over increased from $10,440 to $12,350, a rise of about one-fifth, compared with a rise of about 15 percent for all males 25 years old and over. Among male year-round full-time workers, the mean income for those completing 4 or more years of college was $17,880 in 1972 compared with $16,030 five years ago.

Lifetime Income Estimates

In this report, lifetime income estimates for different educational categories, based on data for specific years, represent a summation of the products of both mean income estimates of different age and education groups and the number of survivors in the comparable population out of 100,000 at birth from an initial stipulated age to a terminal one, divided by the comparable number out of 100,000 at birth who survived to the

initial stipulated age. Thus, lifetime income estimates are a measure of the incomes that could be expected on the average by members of specific education groups in a lifetime (or for any specified span of years) if the mean income estimates by age and education, and life expectancy rates, did not change from those existing in the reference year, e.g., 1972.

The estimated lifetime income of all men from age 18 to death increased from $322,000 in 1956 (in 1972 dollars) to $471,000 in 1972, $149,000 or 46 percent.

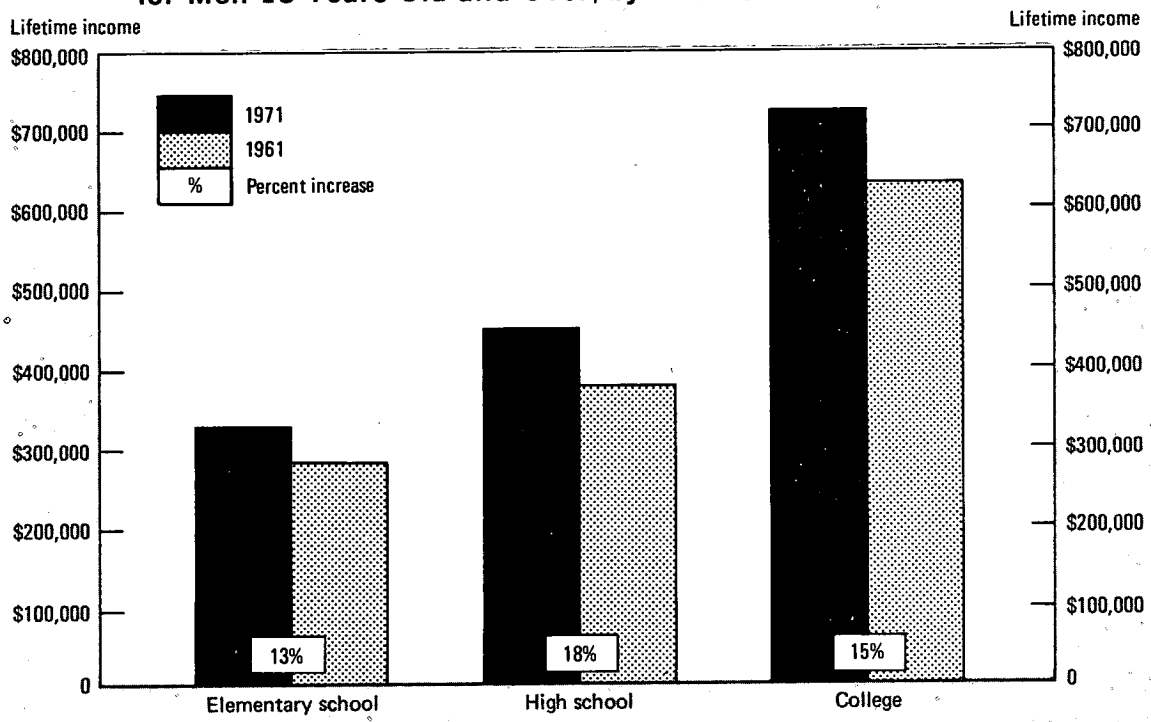
In 1972, men who completed high school could expect to receive from age 18 to death about $479,000 during their lifetime, or $135,000 more than men who completed only elementary school. The estimated lifetime income in 1972 of men completing 4 or more years of college was $279,000 higher than those who had completed only high school.

Additional schooling is associated with a substantial increase in lifetime income. As usual, the greatest income gains were at the college level. In 1972, men with 1 to 3 years of college training can expect to receive more than one-half of a million dollars in their lifetime, whereas for men with 4 or more years of college the estimated lifetime income was about three-quarters of a million dollars.

The estimated lifetime income of all men from age 25 to death was $448,000 in 1972, a gain of about $24,000 or 6 percent over the 1971 estimated lifetime income.

Between 1967 and 1972, the estimated liftetime income in terms of constant dollars of all men from age 25 to death increased from $385,000 to $448,000, a gain of $63,000 or 16 percent. However, for male year-round full-time workers, the estimated lifetime income was $542,000 in 1972, $86,000 or 19 percent over the five-year period.

Figure 2.--Estimated Lifetime Income in 1971 and 1961 in Constant 1972 Dollars for Men 18 Years Old and Over, by Educational Attainment



Mean Income Data on a Cohort Basis

The presentation of income data for the years 1971 and 1961 in terms of birth cohorts shifts the analytic emphasis from describing changes in mean income annually in the economy to describing changes in mean income of particular cohorts as they move through their respective life cycles. The three male birth cohorts for which comparisons can be made are 1927 to 1936, 1917 to 1926, and 1907 to 1916 (table C). With a few exceptions, the largest absolute and relative increase in mean income by educational attainment was for the 1927 to 1936 birth cohort, i.e., those 25 to 34 years old in 1961 but who were 35 to 44 years old in 1971. Within this cohort, those completing 4 or more years of college had a $7,750 increase in mean income, a gain of 74 percent over the 1961 mean income. Within this educational group, those with 5 or more years of college had a $8,730 increase in mean income, representing about 83 percent increase over the 1961 income level. With a few exceptions, the smallest gains in mean incomes between 1961 and 1971 were for the cohort born during 1907 to 1916 (those who were 45 to 54 years old in 1961 and 55 to 64 years old in 1971).

Between 1961 and 1971, men completing 4 or more years of college and born between 1927 and 1936 (those who were 25 to 34 years old in 1961 and 35 to 44 years old in 1971) had average annual income increases of 7.4 percent; whereas during the same time period, men who were 10 years older had annual increases of about 3.5 percent; and those who were 20 years older had annual gains of about 1.1 percent.

As also shown in table C, it appears that the same general type of relationship as found for the 1961 and 1971 data also applies for the 1956 and 1966 data. Thus, men completing 4 or more years of college and born during 1922 to 1931 (those who were 25 to 34 years old in 1956 and who were 35 to 44 years old in 1966) had the highest rate of increase in mean income over the ten-year period as compared with the other age cohorts.

[1]Actual change over the decade, i.e., between 1961 and 1971. (Based on cohort data.)
Column 1 was obtained from table C, column 3.
Column 4 was obtained from table C, column 4, and then divided by 10 years for annual rate of increase.

[2]Change associated with pure "aging." (Based on cross-section data.)
Column 2 was derived from table C, column 2, by subtracting the mean income for the younger age cohort from the mean income for the succeeding older age cohort.

Example: $6,702 (Mean income in 1961 of men 35 to 44 years old with 8 years elementary school completed)
-5,639 (Mean income in 1961 of men 25 to 34 years old with 8 years elementary school completed)
$1,063 (Change associated with age)

Column 5 was derived by dividing $1,063 by $5,639 and then dividing the results by 10 years for annual rate of increase.

Example: $\frac{\$1,063}{\$5,639}$ = 19 percent ÷ 10 years for annual rate of increase.

[3]Change due to productivity and other growth factors. (Difference)
Column 3 was obtained by subtracting algebraically column 2 from column 1.
Column 6 was obtained by subtracting algebraically column 5 from column 4.

METHODOLOGICAL PROCEDURE TO ESTIMATE LIFETIME INCOME

1. Method Used to Prepare Estimates in Tables B, 6, 7, and 8.

Lifetime income estimates for men are estimated by (1) multiplying a cross-sectional survivor population for each age group with mean income estimates; (2) summing these products; and (3) dividing aggregate income by a stationary population at a given age. For each year, the surviving (stationary) population includes males per 100,000 born alive who reach a certain age level. The mean income represents the average of a group of income recipients for a given age and educational attainment category. The stationary population used to divide the aggregate covers males reaching the age level at the lower bound of the time interval, e.g., 18 years of age. In symbols:

$$L_i = \frac{1}{X_m}\left(\sum_{j=m}^{n} Z_j Y_{ij}\right)$$

i = Educational attainment group.

m = Age at lower bound of time interval.

n = Age at upper bound of time interval.

L_i = "Lifetime" income for the ith educational attainment group.

X_m = Surviving male population per 100,000 born alive who reach m years of age.

Z_j = Surviving male population per 100,000 born alive within jth age group.

Y_{ij} = Mean income for men with ith education within jth age group.

The data for the surviving male population and an illustration of the computation procedures are presented in tables G and H.

2. Method Used to Prepare Estimates in Tables 9 to 29.

The following formula describes the basic method used to prepare the estimates, showing the present value of the expected income from any given age through age 64.

$$V_A = \sum_{N=A}^{64} \frac{Y_N P_N \quad (1+X)^{N-A+1/2}}{(1+R)^{N-A+1}}$$

V_A = The present value of the total sum of income received between a given age A and age 64.

Y_N = The average (mean) annual income at age N. These single year of age estimates were obtained by fitting a parabolic function to the age-group data shown in tables A, 3, 4, and 5.

P_N = The relative number of survivors at age N of those alive at age A. The underlying data are presented in *Vital Statistics of the United States*, Vol. II, Section 5, Life Tables.

X = Assumed annual increase in income due to rising productivity. Four different values are used: 0 percent, 2 percent, 3 percent, and 4 percent. This factor is added to the equation to allow for the fact that in a growing economy, "every individual may expect an upward trend in his own income, superimposed on the cross-sectional pattern for a given year."[2] It is an adjustment for the growth in productivity in the economy, not for the inflation of prices.

R = The rate of discount used to convert future income to their present values. Four different rates of discount are used: 0 percent, 3 percent, 5 percent, and 7 percent.

For many purposes, it is important to estimate the present value of lifetime income less the cost of maintenance for the individual worker. To facilitate the preparation of such estimates, table 29 shows the maintenance costs under alternative assumptions. All variables are used with the same meanings as above. M represents the maintenance costs; values used were 0, $1,000, $2,000, $3,000, and $4,000. To obtain the present value of lifetime income, less maintenance, the values in table 29 should be subtracted from those shown in tables 9 to 28 for each age.

$$M_A = \sum_{N=A}^{64} \frac{MP_N \quad (1+X)^{N-A+1/2}}{(1+R)^{N-A+1}}$$

For more detailed definitions of the terms and concepts used to prepare the estimates, see U.S. Bureau of the Census, Present Value of Estimated Lifetime Earnings, Technical Paper No. 16.

[1] Estimated number of man-years lived for the years 1971 and 1972 are not available. The 1970 data were used as approximations for the years 1971 and 1972.

Source: U. S. Department of Health, Education, and Welfare, "Vital Statistics of the United States," section 5.

Table H. Procedure Used To Estimate Lifetime Income

Standard life-table techniques were used to compute estimated lifetime income. The life table used is shown in table G, and the mean incomes are presented in tables 1 and 2. The following is a step-by-step description of the procedure used to obtain the estimated lifetime income in 1972 of men who had completed less than 8 years of elementary school:

Step 1. - - - Out of every 100,000 male children born in 1972, 96,355 could expect to survive to age 18.

Step 2. - - - Out of 96,355 who survive to age 18, 94,900 will survive to age 24. Between the ages of 18 and 24 they will have lived 669,594 man-years. Assume that each year they receive a mean income of $3,399 (this is the mean income in 1972 of men 18 to 24 years old). The total expected income from age 18 to 24 is..... $2,276,000,000

Step 3. - - - Out of 94,900 who survive to age 24, 92,857 will survive to age 34. Between the ages of 25 and 34 they will have lived 939,151 man-years. Assume that each year they receive a mean income of $5,699 (this is the mean income in 1972 of men 25 to 34 years old). The total expected income from age 25 to 34 is..... $5,352,000,000

Step 4. - - - Out of 92,857 who survive to age 34, 89,146 can be expected to survive to age 44. Their total man-years of life will be 912,514. Assuming a mean income of $7,040 per year gives them a total expected income of..... $6,424,000,000

Step 5. - - - Out of 89,146 who survive to age 44, 80,854 can be expected to survive to age 54. Their total man-years of life will be 855,520. Assuming a mean income of $6,834 per year gives them a total expected income of..... $5,847,000,000

Step 6. - - - Out of 80,854 who survive to age 54, 63,787 can be expected to survive to age 64. Their total man-years of life will be 731,671. Assuming a mean income of $5,844 per year gives them a total expected income of..... $4,276,000,000

Step 7. - - - Out of 63,787 who survive to age 64, the total man-years of life for those 65 years old and over will be 827,238. Assuming a mean income of $3,390 per year gives them a total expected income of..... $2,804,000,000

Step 8. - - - Adding up all of the amounts listed above leads to the conclusion that the 96,355 men who reached age 18 would have received about $27.0 billion during their lifetime. The average for each one was therefore..... $280,000

Limitation of Lifetime Income Estimates

The actual population and income inputs used in computing lifetime income estimates classified by educational attainment do not match precisely the required data specifications for this exercise. In preparing the lifetime income estimates, there are at least three necessary assumptions which place some limitations on the results. These assumptions are:

1. There is no significant differential in male mortality in each age group when standardized for educational attainment;

2. There is no significant difference among the noninstitutional population, institutional inmate population, and members of the Armed Forces living in barracks, in the proportion of men in each educational attainment category by age group. This assumption has to be made since mean incomes for men are based on the noninstitutional population only obtained from the Current Population Survey, but the life tables are based on the total male population; and

3. There is no significant difference in the probability of men in the noninstitutional population having income with respect to age group and educational attainment. Under longstanding rules established by the Bureau of the Census, measures of central tendency for persons income, e.g., mean income, is computed based on the number of persons with income only.

Each of these assumptions acts to reduce relative differences in expected lifetime incomes for men with less education compared with those with more education. Thus, compared with men with more education, those with less education tend to have higher mortality rates, higher prevalence rates as inmates of institutions, and higher rates of persons without income.

In summary, the inputs used in preparing lifetime income estimates by educational groups affect the results in two ways. First, the use of a standard surviving population leaves too many survivors for those with less education and too few survivors for those with more education because of the differential mortality experience for men by age and education. Secondly, the computational procedures used to derive mean income from the March Current Population Survey tend to overstate more the "true" mean income for men with less education at given ages than for men with more education for the same age groups. As a result, the differences in estimated male lifetime income between the different educational attainment groups tend to be less than they would be if the limiting assumptions associated with the data were not present.

For a more detailed explanation on the limitation of lifetime income estimates, see Series P-60, No. 56, pages 20 to 22.

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received during the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts or net rental income, or net royalties; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, workmen's compensation, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, and other periodic income.

The amounts received represent income before deductions for personal income taxes, Social Security, union dues, Medicare, bonds, etc.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income.

Mean income. The amount obtained by dividing the total income of a group by the number of income recipients in that group. In the derivation of aggregate amounts based on grouped data, the number of males in each income interval was multiplied by an estimated mean income. For income intervals below $8,000, the midpoint of each class interval was used; $8,900 was used for the interval $8,000 to $9,999; $12,000 for the interval $10,000 to $14,999; and $19,000 for the interval $15,000 to $24,999. For the $25,000 and over interval, the interpolation was from a Pareto Curve fitted to the data for the upper income range. The estimation procedure used to compute mean incomes and lifetime incomes based on grouped data somewhat overestimates the values than estimates developed from procedures based on ungrouped data. For a more detailed explanation on mean income and lifetime income based on ungrouped and grouped data, see Series P-60, No. 74, pages 20 to 22.

Age. The age classification is based on the age of the person at his last birthday.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained in the Current Population Survey of the Bureau of the Census. The current sample is spread over 461 areas comprising 923 counties and independent cities, with coverage in each of the 50 States and the District of Columbia. Approximately 47,000 households are designated in the Current Population Survey for interview each month. Of this number, 2,000 occupied units, on the average, are visited but not interviewed because the occupants are not found at home after repeated calls or are unavailable for some other reason. In additon to the 47,000 there are about 8,000 sample units in an average month which are visited but are found to be vacant or otherwise not to be enumerated. For 1967 through 1971 the sample was spread over 449 areas comprising 863 counties and independent cities. For the years prior to 1967, the sample was spread over fewer areas with fewer interviewed households. Prior to the March 1966 survey, income data were collected from only 75 percent of the households included in the CPS. See Current Population Reports, Series P-23, No. 22, "Concepts and Methods Used in Manpower Statistics from the Current Population Survey," June 1967, pp. 7-10, for more information about the sample design.

The estimation procedure involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from the 1970 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals are added the population in the Armed Forces living off post or with their families on post. A further adjustment is made to give all members of a household the same weight while leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates. Since the estimates are based on a sample, they differ from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability.

In most cases the schedule entries for income are based on memory rather than on records, and in the majority of cases on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding of the scope of the income concept.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the

sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by the use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures in Table I and Table J below, are approximations to the standard errors of the estimated mean 1972 incomes and lifetime incomes of males in specific educational attainment categories. The standard errors are also rough approximations for the 1966-1971 estimates of the same characteristics. The standard errors for these same characteristics from 1956 through 1964 are roughly equivalent to 1.4 times the approximate standard errors.

Illustration. Table 6 of this report shows that in 1972, males 18 years old and over with just an elementary education had a computed expected lifetime income (from age 18 to death) of $343,730. Table I shows the standard error for this estimate to be approximately $4,200. The chances are about 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than $8,400 (twice the standard error).

Table I. Approximate Standard Errors of Expected Lifetime Income for Males 18 Years Old and Over, by Years of School Completed

Years of school completed	Lifetime income	
	1972 estimate	Standard error
Elementary: 8 years.....	$343,730	$4,200
High school: 4 years.....	478,873	4,400
College: 1 to 3 years.....	543,435	8,100
4 years or more..	757,923	15,300

Note: Standard errors apply for 1966-1972; for 1956 through 1964 multiply the above standard errors by 1.4.

Table J. Approximate Standard Errors of Mean Annual Income for Males by Years of School Completed and Age

Years of school completed and age	Mean income	
	1972 estimate	Standard error
25 YEARS OLD AND OVER		
Elementary: 8 years.....	$6,756	$83
High school: 4 years.....	10,433	62
College: 1 to 3 years.....	11,867	131
4 years or more..	16,201	183
25 TO 34 YEARS OLD		
High school: 1 to 3 years.....	7,856	144
35 TO 44 YEARS OLD		
Elementary: 8 years.....	8,508	245
45 TO 54 YEARS OLD		
High school: 4 years.....	11,774	147
College: 5 years or more..	21,096	962
55 TO 64 YEARS OLD		
College: 4 years or more..	19,078	954

Note: Standard errors apply for 1966-1972; for 1956 through 1964 multiply the above standard errors by 1.4.

Table 6 of this report also shows that in 1964 males with just an elementary education had a computed lifetime income (from age 18 to death) of $223,946. 1.4 times the standard error for this type of estimate in table I is approximately $5,900. The chances are about 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than $5,900. The chances are 95 out of 100 that the estimate would have been a figure differing from a complete census figure by less than $11,800 (twice the standard error).

Differences. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, how-

ever, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Table 6 of this report shows that in 1972, college graduate males 18 years old and over had a computed lifetime income (from age 18 to death) of $757,923. Thus, the apparent difference in computed lifetime income between males with only elementary education and those who are college graduates is $414,193. The standard error of $343,730 is $4,200 as shown above. Table I shows the standard error of $757,923 to be $15,300. The standard error of the estimated difference of $414,193 is about $15,900 = $\sqrt{(\$4{,}200)^2 + (\$15{,}300)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the samples would differ from the difference derived using complete census figures by less than $15,900. The 68 percent confidence interval around the $414,193 difference is from $398,293 to $430,093, i.e., $414,193 ± $15,900. A conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is $382,393 to $445,993 and thus we can conclude with 95 percent confidence that the 1972 computed lifetime income of males with elementary education is actually less than that of males who are college graduates.

Table 1. MEAN INCOME IN 1956 TO 1972 OF MEN 25 YEARS OLD AND OVER, BY YEARS OF SCHOOL COMPLETED AND AGE
