Illustrative Projections of Money Income Size Distributions, for Households: 1980 to 1995

In the 1980 census, the Bureau plans to discontinue the use of the terms "head of family" and "head of household." In this report, the term "householder" has been used in place of the term "head." Further discussion of this change can be found in the section, "Head versus householder."

INTRODUCTION

This report contains illustrative projections of income distributions for households by type of household and age of householder. *No attempt has been made to forecast changes in income or its distribution.* The tables contain income distributions for various sets of assumptions. The user can prepare income distribution forecasts by forecasting mean household income growth rates and then choosing the projected distributions which most nearly conform to these forecasts. The report updates similar information contained in Current Population Reports, Series P-23, No. 47, *Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals,* which was published in 1974.

Projections have been prepared for all households, family households, husband-wife households, and nonfamily households by age of the householder for the years 1980, 1985, 1990, and 1995. For each of the years, separate projected distributions are shown for assumed annual growth rates of 0.0, 1.0, 1.5, 2.0, 2.5, 3.0, and 4.0 percent. These rates were chosen for illustrative purposes only and do not necessarily demarcate the range of reasonable future growth. Growth in real mean income has been in the 1- to 3-percent range during the past 20 years. All of the projections were made using Series II national population projections.[1] In addition to the projected number of units in each income interval, the tables also contain projected aggregate income for the same income intervals and a percent distribution for each of the above.

It should be noted that the income intervals and income amounts refer to dollars of 1977 purchasing power. Thus, the differences in the projected income distributions compared to those for 1977 are "real" in that they do not reflect any reduction in the purchasing power of the dollar resulting from inflation. Projections such as these are called "constant dollar" projections because they assume that the purchasing power of the dollar remains constant over the projection period. "Current dollar" projections, on the other hand, would add an additional factor for inflation and would yield projected distributions in terms of the purchasing power of the dollar in the projected year.

The difference between current dollar and constant dollar projections can be illustrated by comparing the change in mean family income between 1957 and 1977. During this 20-year period, mean family income measured in constant dollars increased at an average annual rate of about 2.2 percent per year. If in 1957, one had made a projection for 1977 in terms of dollars of 1957 purchasing power, assuming a 2.2 percent per year growth rate for mean family income, the projected amount would have been about $8,400. However, because prices also increased during this period, estimated 1977 mean family income when measured early in 1978 was about $18,300. The difference between the projected amount of $8,400 in 1957 dollars and the estimated amount of $18,300 in 1977 dollars does not reflect any difference in total purchasing power, but rather reflects inflation which occurred between 1957 and 1977. Looking ahead, one can expect the same type of differences to occur with these projections, although the magnitude of the difference will depend on the number of years being projected and future rates of inflation. Thus, for example, the 1985 current dollar mean family income when actually measured in 1985 will probably be somewhat greater than our projected amounts which are in 1977 constant dollars.

Although current dollar projections may have some usefulness, constant dollar projections are more meaningful. For example, if no real economic growth occurred on a per household basis between 1977 and 1985 but the price level increased at a rate of 8 percent per year, then a 1985 income distribution in dollars of 1985 purchasing power would show more families in the higher income brackets and fewer in the lower income brackets. However, the households in 1985 would not be any better off in terms of real income than were the households in 1977. Although the 1985 households have more dollars, the purchasing power of each dollar is less than it was in 1977, leaving the total purchasing power unchanged. On the other hand if the 1985 income distribution projections were made in 1977 constant dollars, the 1985 and 1977 income distributions would be similar.[2] In summary, the income projections shown in this report are in real terms and they do not account for any inflation which may occur in the future.

[1] See Current Population Reports, Series P-25, No. 704 (July 1977) and No. 805 (May 1979) for details of methodology used to estimate numbers of households by age and type.

[2] Small differences would occur because of changes in the structure of households and age of householders.

Table A. Percent Distribution of Households and Aggregate Income of Households, by Total Money Income in 1977, With Projections for 1980, 1985, 1990, and 1995, by Selected Annual Compound Growth Rates, for Population Projection Series C

Table A summarizes some of the major findings of the income projections. For example, if the average income of families were to grow at a rate of 2 percent per year, by 1990 the proportion of households with incomes under $10,000 would decrease to 30 percent compared to the 1977 proportion of 37 percent. Median household income would increase to about $16,860 in terms of 1977 purchasing power. This is almost 25 percent higher than the 1977 median of $13,570. During this same period, the proportion of households having money incomes of $35,000 or more would double, increasing from 7 percent in 1977 to 14 percent in 1990. Correspondingly, the proportion of aggregate money income in this upper income group would show a large increase, from 21 percent to 35 percent.

The projections for *all* households combined disguise the fact that different types of households have different levels of income. For example, assuming a 2-percent annual growth in income, by 1990 approximately 52 percent of nonfamily households would have $10,000 or less compared to only 20 percent of family households. In addition, the 1990 median income for family households would be $20,500 compared to only $9,520 for nonfamily households. At the other end of the income scale, about 18 percent of family households would have incomes above $35,000 in 1990 compared to only 4 percent of nonfamily households.

One reason that nonfamily households tend to have lower incomes than family households is the relative difference in the size of these two types of units. The average size for nonfamily households (1.17 in March 1978) is much smaller than for family households (3.36 in March 1978), since many nonfamily households are comprised of one individual living alone (88 percent in March 1978). In general, the larger family households are more likely to have multiple earners present—particularly in husband-wife families—which tends to increase family income levels.

Income projections have been prepared based on household projection series A, B, C, and D as described in Current Population Reports, Series P-25, No. 805. However, only series C and D are included in this report, due to space considerations. The A and B projections series are available to the public at cost. In addition, projections at annual growth rates of 1.5, 3.5, and 4.5 percent are available for all four of the projection series. Interested users should contact the Income and Poverty Statistics Branch, Population Division, Bureau of the Census, Building 3, Washington, D.C. 20233.

Table B summarizes the differences in median and mean income that result from using the four different household projection series. Although table B is based on the assumption of zero growth in income, the projected median and mean incomes for *total* households actually show a change over time. Under the assumption of no growth in income, there would be no change in income for each specific age group (e.g., 14 to 24 years old) within each specific type of household (e.g., husband-wife households). However, when the income distributions for the specific types of households are combined to produce an income distribution for total households, the growth rate for income changes, as indicated in table B. The rate of growth changes because of the assumptions in the household projections concerning changes in household composition and the age structure of the population over time. Since income varies by type of household and age of householder, a change in the "mix" of households affects the overall household income levels.

Under the assumption of zero growth in income, all of the household projection series result in a slight negative change in income over time for total households (see the last four columns of table B). The largest negative influence occurs for the series A projections whereas the smallest negative influence occurs for the series D projections. There is a predominantly negative influence on family household income over time, since the household projections assume some continued growth in families without a husband and wife present, which tend to have lower incomes. On the other hand, the assumptions produce a predominantly positive influence on nonfamily household income over time, as a larger proportion of the people in such households move into the higher-income age brackets.

USING THE TABLES

Each of the detailed tables in this report shows an income size distribution for "total households." These "total households" distributions were computed assuming that the income growth rate was the same for all age groups. If desired the user can construct his own "total household" distribution projections using different income growth rate assumptions for each age group. This is done by choosing, from the growth rates provided, the projected income size distributions for each age group and then adding the distributions together. If a user should need distributions assuming a uniform income growth rate of 1.25, 1.75, 2.25, etc., such distributions can be approximated by adding the number of households in each income class for the distributions just above and just below the desired growth rate, and then dividing the sum in half.

To illustrate the above, let us assume that one wanted to prepare the family household income size distribution for 1985 assuming the following mean income growth rates which are approximately equal to the average annual rate of growth found for each age group over the past 20 years:

Age of Family Householder	Assumed Growth Rate of Mean Family Income
14 to 24 years.	1.25 percent per year
25 to 34 years.	2.0 percent per year
35 to 44 years.	2.25 percent per year
45 to 54 years.	2.75 percent per year
55 to 64 years.	2.75 percent per year
65 years and over	2.5 percent per year

Table B. Median, Mean, and Annual Compound Growth Rate in Mean Income for Households, by Type of Household, for Population Projections Series A, B, C, and D

(In 1977 dollars. Based on projected growth rate of income of 0.0 percent per year)

Assumed mean income growth rate	1.0	1.5	1.25	2.0	2.5	2.25	2.5	3.0	2.75	2.5	3.0	2.75

To begin, one would need to approximate the 1.25, 2.25, and 2.75 percent growth rate distributions since they are not shown in the report. Table C below shows the derivation of these distributions. Column (a) shows the 1985 distribution of family households with householder between 14 and 24 years of age assuming a 1.0 percent per year growth rate in average income per household. Column (b) shows the distribution for a 1.5 percent growth rate. The next column, which shows the distribution for an income growth rate of approximately 1.25 percent per year, is derived by adding the number of family households in columns (a) and (b) for each income group and dividing the resulting sum by 2. For example, the number of family households in column (c) for the under $2,500 income group is equal to

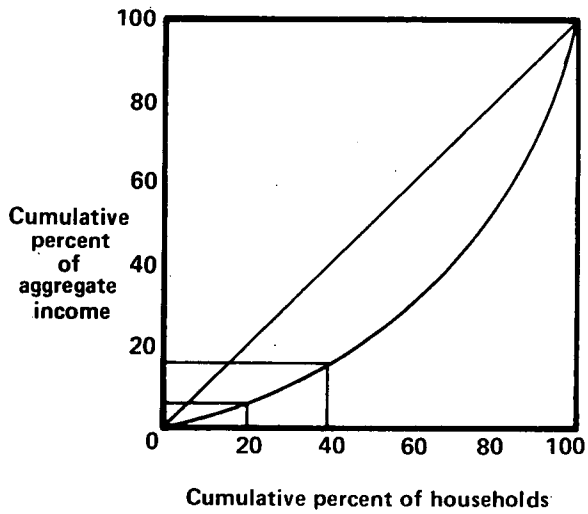
$$(283 + 268) \div 2 = 276.$$

After this has been done, the distribution for all family households for 1985 can be calculated as shown in table D. The distributions for age groups 14 to 24, 35 to 44, 45 to 54, and 55 to 64 years are posted from table C. The distribution for the other age groups are posted directly from the detailed tables. The projected distribution for all family households is derived by adding the number of family households in each age group for each income interval. The resulting total distribution embodies the assumed income growth rates for each age group.

Table E provides the average annual growth rates of mean income for the last 5, 10, 15, and 20 years preceding 1977 for families and unrelated individuals, families, husband-wife families, and unrelated individuals in each age group. Since annual household income data are not available before 1967, it is suggested that the above four categories be used as proxies for total households, family households, husband-wife households, and nonfamily households, respectively.

METHODOLOGY

Underlying all of the income projections are two assumptions: dollars in terms of 1977 purchasing power and a constant income Lorenz curve for each specific age group within each type of houshold. A constant Lorenz curve implies that the relationship between the cumulative percent of households and of their income is constant over time. For example, the following Lorenz curve shows that the lowest 20 percent of households (ranked by the size of their income) received 5 percent of total household income, and the lowest 40 percent of households received 17 percent of the income. The projected distributions for each age group within each type of household would maintain this relationship between the cumulative percent of households and the cumulative percent of their income.



Several steps were involved in developing the projected income size distributions in this report. These steps are outlined below.

1. Using 1977 income year data from the March 1978 Current Population Survey, the distribution of the number of households and their aggregate income was calculated for each age group within each specific type of

Table D. Derivation of 1985 Income Distributions for All Family Households, by Age of Householder, for the Assumed Growth Rates

[1] Includes families with male householder, no wife present, and female householder, no husband present, not shown separately.

household using 225 income class intervals. The large number of income class intervals was used in order to minimize the interpolation errors in the resulting projections.

2. The proportion of households in each income interval was calculated for each age group within each type of household. These proportions were then multiplied by the projected total number of households for the projection year.

3. A projection ratio was determined by compounding the assumed growth rate for the number of years to be projected.

4. The upper limit for each income interval for each group was multiplied by the projection ratio; this produced a projected income distribution for the desired year.

5. The distribution of aggregate income for the projected distribution was obtaind by multiplying the mean income in each interval by the projection ratio from step (3) by the projected number of households in each interval determined in step (2).

6. The projected number of households corresponding to the detailed intervals from step (4) were redistributed to the published intervals by applying Pareto interpolation to the cumulative distribution of these households. In accordance with Pareto interpolation, the distribution was cumulated from the highest to the lowest income interval.[3]

7. The projected aggregate income was redistributed to the published income intervals in this report using the following approach. The aggregate income for the published intervals was obtained by summing the aggregate incomes for all detailed intervals between the published intervals. The aggregate income of the subinterval between the published interval and the next highest detailed interval was determined by multiplying the midpoint of the subinterval by the interpolated number of households in the subinterval.

8. The distribution of households and aggregate income for each age group within each type of household were then combined to produce total distributions for each type of household and for all households combined.

9. After the distribution of households and aggregate income were placed in the desired income intervals, summary measures were calculated. These measures include median income (using Pareto interpolation), mean income (projected aggregate income divided by projected number of households), and the associated growth rates in the number of households, mean income, and aggregate income.

The above procedure was repeated for each household projection series and for each projected year.

[3] For more information on the use of Pareto techniques, see "Estimation of Summary Measures of Income Size Distribution from Grouped Data," by Emmett F. Spiers, published in the American Statistical Association, *Proceedings of the Social Statistics Section*, 1977.

LIMITATIONS

Three types of limitations should be kept in mind when using or interpreting these projections. First, the income concept used throughout this report is restricted to periodically received money income. These statistics do not include any income which may accrue to a household in a nonmonetary form. Examples of nonmoney income are: full or partial payments by employers for retirement and medical programs, meals and housing; farm products produced and consumed directly on farms; and nonmoney transfer payments such as food stamps, Medicare, Medicaid, and subsidized housing. Also excluded from the income concept are money receipts which are not normally received periodically such as capital gains, gifts, and lump-sum inheritances or insurance payments. Since some households may receive a substantial portion of their income in nonmoney forms, their position in the money income distribution may not accurately reflect their level of living. This condition may become more pronounced in the future if present trends in the growth of nonmoney income continues.

Second, no attempt was made to correct for nonreporting or underreporting of income in the 1977 base-year income statistics. Overall, the 1977 amounts as reported in the Current Population Survey were found to be about 90 percent of independently derived benchmark amounts. Because the projections in this report are built on the base year estimates, this relative underreporting of income is carried forward into the projections.

Third, although projections vary greatly as to the certainty which may be assigned to them, no way has been found to assign a measure of probability to projections. The procedure for suggesting the uncertainty of projections in this report has been to show a range of assumed values for each set. While the range provides a rough indication of the reliability of the projection, the range does not necessarily demarcate the range of assumptions that have a good chance or realization.

Appendix A. Definitions and Explanations

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household.

Householder. One person in each household was designated as the householder. If there is only one person living in the housing unit then that person is the householder. Otherwise, the householder is usually the person regarded by other household members as the person maintaining the household. Women are not classified as householders if their spouses are resident members of the household at the time of the survey.

Head versus householder. In the 1980 census the Census Bureau plans to discontinue the use of the terms "head of family" and "head of household." Recent social changes have resulted in a trend toward more nearly equal status for adult members of a household and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau is planning to change its longtime practice of always classifying the husband as head when he and his wife are living together.

In the 1980 census, a "householder" will be the household reference person. The householder will be the first adult household member listed on the census questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, and thereby becomes the reference person or householder to whom the relationship of other household members is to be recorded. However, in order to provide some comparability with earlier years, the husband will be shown as the householder in a selected number of tables. Users of this report are cautioned that the term "householder" refers to the "head," as defined in earlier reports.

Family. The term "family" refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the householder and the son's wife are in the household they are treated as part of the householder's family. On the other hand, a lodger and the lodger's spouse not related to the householder or an unrelated servant and spouse are considered as additional families, and not a part of the householders' family.

Family household. A household with a family present in which the householder is one of the family members is referred to as a family household. In some of these households, there are other persons present who are not related to the family. In March 1978, about 1.5 percent of the family households had other unrelated persons present. Since the proportion of such households is comparatively small, the income of family households is very similar to that for families. For example, in 1977 the median family income was $16,010 compared to a median for family households of $16,080.

Husband-wife household. A family household maintained by a married couple is referred to as a husband-wife household. Such households may have other persons present who are not related to the householder. Detailed tables which display data by age of the householder refer to age of the husband.

Nonfamily household. A household in which the householder is not related to any other members of the household is referred to as a nonfamily household. A nonfamily household may consist of one person living alone or may include the householder and one or more families or nonfamily members. For example, a widow living by herself or with one or more other persons not related to her is an example of a nonfamily household.

Age. The age classification is based on the age of the householder when surveyed.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in 1977 from each of the following sources: (1) money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or

welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

It should be noted that the 1977 income statistics are based on income received during the calendar year, while the household characteristics (age and type of household) are for March 1978. However, the income projections by age and type of household are based on these characteristics for the projected year.

Household income does not include amounts received by persons who were members of the household during all or part of 1977 if these persons did not reside with the household in March 1978. Conversely, household income includes amounts reported by persons who did not reside with the household during the income year but who were members of the household at the time of enumeration in March 1978.

Data on household income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some households receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm households receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income. For further discussion, see Current Population Reports, Series P-60, No. 118.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. Medicare reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments such as aid to families with dependent children and general assistance.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Unemployment compensation, veterans' payments, or workmen's compensation include (1) unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans

Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private and government employee pensions include (1) private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

Annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts, and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings. The algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Income other than earnings. The algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings. The total income of a household is the algebraic sum of the amounts received by all income recipients in the household.

The income tables for households include in the lowest income group (under $2,500) those that were classified as having no income in 1977 and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted households, unrelated individuals who had recently left families, or households in which the sole bread-winner had recently died or had left the household. However, many of the households who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of households (as appropriate) in that group.

Aggregate income. The sum of all income received by persons in a specific group is the aggregate income for that group.

Annual growth rate. The amount of growth compounded annually which would result in the base period estimate to equal the projected estimate is the annual growth rate. Annual growth rate is calculated by the formula

$$P_n = P_o(1+r)^n$$

which implies that

$$r = \left[\frac{P_n}{P_o}\right]^{\frac{1}{n}} - 1$$

where: P_n = Estimate at end of period.

P_o = Estimate at beginning of period.

n = Number of years.

r = Annual rate of growth.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau from 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage.

1. *Income definition.* The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in-kind account for about 4 percent of total personal income. The Census Bureau

definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. *Source of data.* The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. Income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

   For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see *Size Distributions of Family Personal Income: Methodology and Estimates for 1964,* by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. *Population coverage.* The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. *Average income.* The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for households and families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: personal income of the farm population and realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture.

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, *Major Statistical Series of the U.S. Department of Agriculture,* Vol. 3, "Gross and Net Farm Income," released in September 1969.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief pay-

ments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $2,950 (less than $3,700 if 65 years old or over) and married couples receiving less than $4,700 ($5,450 if one spouse is 65 years old or over; $6,200 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the following reasons.

1. The earnings of the following groups are not covered by the earnings record data: many Federal, State, and local government employees; some employees of nonprofit organizations; workers covered by the Railroad Retirement Act; and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.
2. Employees' earnings in excess of $16,500 per employer are not covered by the earnings record data.
3. Income other than earnings is not covered by the earnings record data.
4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

Appendix B. Source of the Base-Year Estimates

The estimates are based on data obtained in the March 1978 Current Population Survey (CPS) and from supplementary questions to the CPS of the Bureau of the Census. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and over in every sample household. In addition, supplementary questions are asked every March about money income in the previous year. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files which is updated continuously to reflect new construction where possible. The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS to produce March 1978 data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the Nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

The estimation procedure used for the monthly CPS data involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population, and additional statistics on births, deaths, immigration and emigration, and statistics on the strength of the Armed Forces. The estimation procedure in March for the data in this report also involves a further adjustment so that husband and wife in a household receive the same weight.

Information concerning sampling variability and statistical reliability of the base year estimates can be found in Current Population Reports, Series P-60, No. 117.

current housing reports

Data on housing vacancies and housing characteristics

U.S. Department of Commerce
BUREAU OF THE CENSUS

CURRENT DATA ON HOUSING

HOUSING VACANCIES (SERIES H-111):

Current statistics on housing vacancies, based on a scientifically selected sample. This series of four quarterly reports and one annual report provide rental vacancy rates and homeowner vacancy rates for the United States, each of the four regions, and inside and outside standard metropolitan statistical areas. The statistics for the current quarter are compared with data for the same quarter in the preceding year. Percent distributions are presented for rental vacancies and homeowner vacancies by the following housing characteristics:

- Number of rooms
- Number of bedrooms
- Number of housing units in the structure
- Duration of vacancy
- Plumbing facilities
- Monthly rent and sale price asked
- Year structure built

Also shown are percent distributions of all vacant housing units by year-round and seasonal status, figures on occupancy and vacancy rates based on the total housing inventory, and the home ownership rate. The annual report, in addition to the above, presents percent distributions of housing characteristics for both renter- and owner-occupied units.

HOUSING CHARACTERISTICS (H-121):

This series of reports is published on an irregular schedule. Individual reports present data for the United States, regions, or local areas on one or more selected housing characteristics. (Publications in this series include 15 reports on television ownership, 1 report on second homes and 1 report on housing units by plumbing facilities and condition, and a special study on housing characteristics classified by the 1959 income of occupants.) Stocks of these reports are exhausted. Photo copies only are available. For information write to: Housing Division, Bureau of the Census, Washington, D.C. 20233

HOW TO ORDER

Both series of current housing reports described in this announcement are available from the Superintendent of Documents in a combined subscription for $5 per year (individual copies vary in price). Use the order form furnished below.

RELATED REPORTS

The Bureau of the Census also issues several series of monthly reports on the construction industry. Subjects covered include housing starts, construction activity, building permits, and housing sales. An announcement and order form covering these reports is available free of charge upon request to: Subscriber Services Section (Publications), Bureau of the Census, Washington, D.C. 20233

(please detach here)

SUBSCRIPTION ORDER FORM **C3.215: H-111**

Please enter my subscription to CURRENT HOUSING REPORTS (Series H-111 and H-121) at $6 per year. Add $1.50 for foreign mailing.
