1970 CENSUS OF POPULATION

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Social and Economic Characteristics by Marital Status for the United States: 1970

(Tables presented herein are reprints of tables 4, 8, 12, and 15 of Final Report PC(2)-4C, **Marital Status**, which contains additional information on the characteristics of persons by marital status as well as more detailed technical explanations)

In 1970 married men and women living with their spouses had more years of school completed (12.2 years) than persons 14 years old and over in other marital status categories (table 4). Persons currently divorced had the next highest number of school years completed followed by those who were married but whose spouses were absent (because of reasons other than marital discord), single persons, persons reported as separated (due to marital discord), and widowed persons. Further, persons who had been married more than once had fewer years of school completed than persons married only once.

Single men and women 20 to 24 years old had the highest median number of school years completed of any age/marital status group, 13.0 for men and 13.4 for women. Separated men and women 65 years old and over had the lowest number of school years completed, 7.7 years and 8.2 years, respectively. To some extent all of these figures reflect the fact that attainment levels tend to vary inversely with age.

Table 8 shows that there is reasonably high correlation between several social and economic variables and the likelihood that persons had experienced a divorce. More than one-fourth of the ever married men 35 to 44 years old who had first married before the

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 25 cents domestic postpaid or 15 cents G.P.O. Bookstore.

age of 20 were known to have had a divorce by 1970, while only about 14 percent of those first married while in their 20's were known to have been divorced. In addition, men of this age were more likely to have been divorced if they had low levels of educational attainment and low incomes than men with higher levels of education and income.

Women 35 to 44 years old in 1970 generally showed the same pattern of likelihood of divorce as their male counterparts with respect to age at first marriage and years of school completed. A higher proportion (22 percent) of the women 35 to 44 years old who were in the labor force in 1970 were known to have been divorced than women of the same age who were not in the labor force in 1970 (13 percent).

About 16 percent of the men and 18 percent of the women of all races 35 to 44 years old were known to have been divorced in 1970. Among white persons 35 to 44 years old 14 percent of the men and 17 percent of the women were known to have had a divorce. The corresponding figures for Negro men and women were 19 percent and 23 percent, respectively.

Most of the 44.6 million married couples in the United States in 1970 were comprised of husbands and wives of the same race. Less than one-half of one percent of all white husbands and about 2 percent of all Negro husbands were married to women of another race. Similarly, less than one-half of one percent of white wives and about 1 percent of Negro wives were married to men of another race (table 12). American Indian husbands and wives were most likely to be married to a person of another race (usually white), with 36 percent of the husbands and 39 percent of the wives having a spouse of another race.

Among white and Negro persons who had been married only once and who were living with their spouses, those men and women with higher levels of educational attainment were more likely to have married a person of the other race. About 2 percent of the Negro men with 13 or more years of school completed were married to white women, whereas less than one-half of 1 percent of the Negro men who had completed 8 years or less of school were married to white women (table 15). Among couples where the husband was white the percent who had married a Negro wife was less than one-half of 1 percent, regardless of the level of his educational achievement.

In addition to the data presented here, Final Report PC(2)-4C, **Marital Status,** presents detailed cross-classifications of marital status for persons 14 years old and over by years since first marriage, occupation, and income. Data are also shown for married couples cross-classified by characteristics of husband and wife such as age, race, years of school completed, and income in 1969.

Marital status.—The marital status classification refers to the status at the time of enumeration. Persons classified as "married" consist of those who have been married only once and those who remarried after having been widowed or divorced. Persons reported as separated (either legally separated or otherwise absent from their spouse because of marital discord) are classified as a subcategory of married persons. Persons in common-law marriages are classified as married, and persons whose only marriage was annulled are classified as never married. Persons classified as never married are shown as "single."

Married persons with "spouse present" are men or women whose wife, or husband, was enumerated as a member of the same household even though he or she may have been temporarily absent on business or vacation, visiting, in a hospital, etc., at the time of enumeration. Married persons with "spouse absent" include both those who are separated because of marital discord and those whose usual place of residence is different from that of their spouse for other reasons, such as service in the Armed Forces or employment at a considerable distance from home.

Marital history.—For all persons in the 5-percent sample reported as married (including separated), widowed, or divorced at the time of the enumeration, data were obtained on the date of the first marriage. From this information and from current age, data on age at first marriage were derived. For each person who had been married more than once, information was obtained on the reason for termination of the first marriage. Persons shown as "known to have been widowed" include widowed persons and those currently married or divorced persons whose first marriage ended in widowhood. Persons shown as "known to have been divorced" include divorced

persons and those currently married or widowed persons whose first marriage did not end in widowhood.

Married couple.—A married couple is defined as a husband and his wife enumerated as members of the same household. The number of married couples, as shown in this report, is identical to the number of married men with wife present.

A "married couple with own household" is a married couple in which the husband is a household head; the number of such married couples is the same as the number of "husband-wife families." Married couples without own household are, by census definition, the same as married couples in subfamilies.

Other characteristics.—Definitions and technical explanations of other characteristics shown here, as well as information on sampling variability, appear in Final Report PC(2)-4C.

Derived figures.—The median, which is a type of average, is the middle value in a distribution; i.e., the median divides the distribution into two equal parts—one-half of the cases fall below the median and one-half of the cases exceed the median.

Symbols.—A dash "—" signifies zero. Three dots "..." mean not applicable or that the base for the derived figure is too small for it to be shown.

Table 4. **Years of School Completed of Persons 14 Years Old and Over by Marital Status, Whether Married More Than Once, Whether Known to Have Been Widowed or Divorced, Age, Race, and Sex: 1970**

[Data based on 5-percent sample, see text. For minimum base for derived figures (percent, median, etc.) and meaning of symbols, see text]

1970 CENSUS OF POPULATION

C(S1)-42
une 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Selected Labor Force Characteristics of Persons and Families for the United States: 1970

(The data presented here are extracted from tables 2, 16, and 26 of Final Report PC(2)-6A, **Employment Status and Work Experience,** which contains additional information on employment and other characteristics as well as more detailed technical explanations)

While the labor force participation rates for men declined between 1940 and 1970, the proportion increased dramatically for women. In 1940, 83 percent of all men 16 years old and over and 27 percent of the women were in the labor force, but by 1970 the labor force rate for men had dropped to 77 percent and the rate for women had climbed to 42 percent. As a result, men accounted for three-fourths of the 1940 labor force but only about 63 percent of the 1970 labor force.

This change in the sex composition of the U.S. work force seems to be related to several factors. The length of the working life for the male labor force has been decreasing as men apparently remain in school longer and retire earlier than heretofore. Specifically, in the age groups 20 and 21 years and 22 to 24 years the labor force rate for men declined by 10 percentage points and 5 percentage points, respectively, between 1940 and 1970. Among those 25 to 59 years old the labor force rates remained relatively stable over the period, but in the age group 60 to 64 years the labor force rate for men declined by 16 percentage points. The most notable decline was for men in the age group 65 to 69 years old where the labor force rate dropped by 20 percentage points between 1940 and 1970, from 59 percent to 39 percent.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 25 cents domestic postpaid or 15 cents G.P.O. Bookstore.

Women, on the other hand, had an increase in labor force participation for every age group. The level of increase (around 25 percentage points) in the ages between 35 and 64 years old indicates that as women complete the years of full-time childrearing, a progressively larger proportion have been entering or re-entering the labor force and continuing to work until retirement age. Moreover, even among women in the primary childbearing years (16 to 34 years old) the proportion in the labor force showed increases ranging from 8 to 14 percentage points.

A significant portion of the increase in labor force participation among women has been due to a larger proportion of married women entering the labor market. A women's participation in the labor force is related to the presence and age of children at home. For women with preschool children in the home, it is more difficult to enter the labor market than for those women whose children have reached school age or for those women with no dependent children. Among all wives 16 years old and over, about 40 percent were in the labor force in 1970. Thirty percent of the wives with children under 6 years of age were in the labor force and almost 50 percent of the women whose youngest child was between 6 and 17 years old were in the labor force. Although the labor force rate for women with no children under 18 years was only about 40 percent, this seemingly low rate is due primarily to the age distribution of the group. If comparisons are restricted to women under 45 years old, the women with no children under 18 had consistently higher labor force rates than did women with children under 6 or from 6 to 17 years old.

Among women who were working, the proportion who worked full time was also related to the presence of children. Of the approximately 3.1 million working wives with children under 6 years old, about 62 percent were working full time and for the 5.5 million working women whose youngest child was between 6 and 17, 64 percent worked full time. However, among the 7.5 million working wives with no children under 18, nearly 75 percent worked full time.

The labor force participation of married women is also related to the level of their husband's earnings. The labor force rates for all wives with children under 18 were higher when the husband earned less than $10,000 than they were for those women whose husbands earned $10,000 or more. For instance, among wives with children under 6 years old, over 30 percent whose husbands earned less than $10,000 in 1969 were in the labor force. Only about 20 percent of the women whose husbands earned between $10,000 and $14,999 and only about 15 percent of the women whose husbands earned $15,000 or more were in the labor force. This relationship between the wife's labor force participation and the husband's earnings also holds true for women whose youngest child was 6 to 17 years old and, to a lesser extent, for wives with no children under 18. Further data on the labor force status and work experience of married women as related to the presence and age of children and the earnings of their husbands can be obtained from the detailed tables which follow.

EMPLOYMENT STATUS

The data on employment status relate to the calendar week preceding the date on which the respondents completed their questionnaires or were interviewed by enumerators. This week is not the same for all respondents because not all persons were enumerated during the same week.

Employed persons comprise all civilians 16 years old and over who were either (a) "at work"–those who did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a family farm or in a family business; or (b) were "with a job but not at work"–those who did not work during the reference week but had jobs or businesses from which they were temporarily absent due to illness, bad weather, industrial dispute, vacation, or other personal reasons. Excluded from the employed are persons whose only activity consisted of work around the house or volunteer work for religious, charitable, and similar organizations.

Persons are classified as unemployed if they were civilians 16 years old and over and (a) were neither "at work" nor "with a job, but not at work" during the reference week, (b) were looking for work during the past 4 weeks, and (c) were available to accept a

job. Persons who did not work at all during the reference week and were waiting to be called back to a job from which they had been laid off are also included as unemployed.

The "civilian labor force" consists of persons classified as employed or unemployed in accordance with the criteria described above. The "labor force" includes all persons in the civilian labor force plus members of the Armed Forces (persons on active duty with the United States Army, Air Force, Navy, Marine Corps, or Coast Guard). All persons 16 years old and over who are not classified as members of the labor force are defined as "not in labor force." This category consists mainly of students, housewives, retired workers, seasonal workers enumerated in an "off" season who were not looking for work, inmates of institutions, disabled persons, and persons doing only incidental unpaid family work (less than 15 hours during the reference week).

HOURS WORKED

The statistics on hours worked relate to persons "at work" during the reference week (the week before enumeration) and represent the number of hours actually worked at all jobs during that week. They do not necessarily reflect the number of hours usually worked or the scheduled number of hours. The category "at work, full time" includes persons who worked 35 hours or more during the reference week, and the category "at work, part time" includes persons who worked 1 to 34 hours during the reference week.

MARITAL STATUS

The marital status classification refers to the status at the time of enumeration. Women classified as "married, husband present" consist of those women with a husband present in the household. Included are women who have been married only once and those who remarried after having been widowed or divorced. Persons in common-law marriages are classifed as married. Persons whose only marriage had been annulled are classified as single.

OWN CHILD

A child under 18 years old is defined as an "own" child if he or she is a single (never married) son, daughter, stepchild, or adopted child of the specified person(s).

WEEKS WORKED IN 1969

Data on weeks worked pertain to the number of weeks during 1969 in which a person did any work for pay or profit (including paid vacation and sick leave) or worked without pay on a family farm or in a family business. Weeks of active service in the Armed Forces are also included.

EARNINGS IN 1969

"Total earnings" is the algebraic sum of the amounts reported as wage or salary income, nonfarm net self-employment income, and farm net self-employment income. The figures represent the amount of income received before deductions for personal income taxes, Social Security, bond purchases, union dues, medicare deductions, etc.

The median earnings is the amount that divides the distribution into two equal groups, one having earnings above the median and the other having earnings below the median.

SAMPLE SIZE, DERIVED FIGURES, AND SYMBOLS

All data for 1970 shown in this report are derived from tabulation of a 5-percent sample of the population adjusted to represent the total population. The data are, therefore, subject to sampling variability. Data for 1960 and 1940 are based on a 5-percent sample and data for 1950 are based on a 3 1/3-percent sample.

Derived figures such as percents and medians are not presented but indicated by three dots "..." if the base is smaller than the minimum number prescribed for the sample on which the figures are based. The minimum bases are 400 for 1970, 1,000 for 1960, 3,000 for 1950, and 2,000 for 1940.

Three dots "..." may also mean not applicable. A dash "-" signifies zero.

Table 2. **Labor Force Status by Single Years of Age and Sex: 1940 to 1970**

(Data for years prior to 1960 exclude Alaska and Hawaii. Data based on 5-percent sample, see text. For minimum base for derived figures (percent, median, etc.) and meaning of symbols, see text)

1970 CENSUS OF POPULATION

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Family Income in 1969 by Family Characteristics for the United States: 1970

(The data presented here are extracted from tables 2, 3, and 9 of Final Report PC(2)-8A, **Sources and Structure of Family Income**, which contains additional information on the characteristics of families and persons with income as well as more detailed technical explanations)

The relative income levels of families with the head as the only earner can be linked directly to occupation. Among the 6.4 million three and four person husband-wife families with the family head the only earner, more than 15 percent had income of $15,000 or more while 6 percent reported incomes below the poverty level. Of the 1.1 million such families headed by a professional, technical, or kindred worker, 34 percent received income of $15,000 or more but only 2 percent were below the poverty level. Among families headed by a craftsman or kindred worker, 8 percent reported $15,000 or more, but nearly 5 percent had income less than the low income or poverty level. Similarly, for families with the head classified as a service worker, only 4 percent had income of $15,000 or more whereas 9 percent received income below the poverty level.

The cross-classification of age and education of heads of husband-wife families in 1970 by their 1969 family income reveals a consistent relationship between age and median family income at all educational levels except in those families with heads who completed 4 years or more of college. For each edu-

cational attainment level below 4 years of college, median family income increases steadily for each age group until the head reaches the age range 55 to 64 and then declines. For example, median family income in 1969 of heads in the 35 to 54 year age category, who were high school graduates, was $12,300, but for the corresponding heads in the 55 to 64 and 65 year and over age groups, the median incomes were $11,900, and $6,500, respectively. However, for families headed by college graduates, family income continued to rise through the 55 to 64 year age group, before median family income declined. In families where the husband had 5 or more years of college, median family incomes for the 35 to 54, 55 to 64, and 65 years and over age categories were $19,700, $21,600, and $13,100, respectively.

An interesting pattern emerges in the income received by the wife in relation to the income level of the husband. Of the 43.6 million husband-wife families with income in 1969, 25.0 million (or 57 percent) were families in which both the husband and wife had some income. When the husband received income up to the $7,000 level, the wife's income was at least half as large as that of the husband. However, when the husband's income exceeded this level, the median amount of income received by the wife, relative to the husband's amount, decreased sharply. For husbands with income of $50,000 or more, the wife's median income was just under $3,000.

Income in 1969.--"Total income" is the algebraic sum of amounts received as wage or salary income, net self-employment income, and income other than earnings. Wage or salary income is defined as the total money earnings received for work performed as an employee. It represents the amount received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or professional enterprise in which the person was engaged on his own account. Income other than earnings includes money income received from such sources as interest, dividends, net rental income, Social Security benefits, pensions, veterans' payments, unemployment insurance, and public assistance or other governmental payments, and periodic receipts from insurance policies or annuities. Not included as income are money received from the sale of property (unless the recipient was engaged in the business of selling such property), the value of income "in kind," withdrawals of bank deposits, money borrowed, tax refunds, and gifts and lump-sum inheritances or insurance payments. Family income is computed by summing the income of all family members 14 years old and over.

Poverty status in 1969.--Families and unrelated individuals are classified as being above or below the poverty level, using the poverty index adopted by a Federal Interagency Committee in 1969. The index provides a range of income cutoffs or "poverty thresholds" adjusted to take into account such factors as family size, sex and age of the family head, the number of children, and farm-nonfarm residence. The poverty cutoffs for farm families have been set at 85 percent of the nonfarm levels. These income cutoffs are updated every year to reflect the changes in the Consumer Price Index. The poverty threshold of a nonfarm family of four was $3,743 in 1969. For a detailed explanation of the poverty definition, see the Volume I reports of the 1970 Census of Population.

SAMPLE SIZE, DERIVED FIGURES, AND SYMBOLS

All data shown in this report are derived from tabulation of a 5-percent sample of the population adjusted to represent the total population. The data are therefore subject to sampling variability. Measures of the sampling variability are shown in Final Report PC(2)-8A.

The median income is the middle value in a distribution, i.e., the median divides the distribution into two equal parts - one-half having income above the median and one-half having income below the median.

The mean income is the amount obtained by dividing the total income of a particular statistical universe by the number of units in that universe. Thus, mean family income is obtained by dividing total family income by the total number of families.

Three dots "..." means not applicable or that the base of a derived figure is too small for it to be shown.

Table 2. **Income and Poverty Status In 1969 of Husband–Wife Families With One Earner or More, by Size of Family, Number of Earners, Occupation, and Race of Head: 1970**

[Data based on 5-percent sample, see text. For minimum base for derived figures (percent, median, etc.) and meaning of symbols, see text]

United States Metropolitan and Nonmetropolitan Residence	Total	Less than $3,000	$3,000 to $3,999	$4,000 to $4,999	$5,000 to $5,999	$6,000 to $6,999	$7,000 to $7,999	$8,000 to $9,999	$10,000 to $14,999	$15,000 to $24,999	$25,000 or more	Median income (dollars)	Mean income (dollars)	With income less than poverty level

1970 CENSUS OF POPULATION

PC(S1)-44
June 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Age and Earnings by Industry for the United States: 1970

(The data presented here are extracted from tables 239, 240, and 241 of Final Report PC(1)-D1, **Detailed Characteristics, United States Summary**, which contains additional information on employment, industrial and occupational distributions, and other characteristics as well as more detailed technical explanations)

At the time of the 1970 census the median age of employed men was 40.2 years and for women it was one year less. Industries with some of the highest median ages for employed men included private households (49.5 years), railroads and railway express service (47.3 years), agriculture (46.3 years), street railways and bus lines (45.8 years), and water transportation (45.0 years). With 2.4 million men employed, agriculture was the largest industry with a median age of 45.0 years or more.

Industries employing relatively young men, under 35 years of age on the average, included several in the major industry group, retail trade. Men working in gasoline service stations had the lowest median age (29.8 years), followed by those in food stores (31.3 years), eating and drinking places (32.7 years), and general merchandise stores (33.7 years). Outside of the retail trade industry group, there were two industries in which men had a median age of less than 35 years--private educational services (34.1 years) and office, accounting, and computing machine manufacturing (34.2 years).

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 30 cents domestic postpaid or 20 cents G.P.O. Bookstore.

As it was for men, the highest median age for employed women was for those employed in the private household industry. Their median age was 50.2 years, or 0.7 years older than for men in that industry. Within the major industry group, personal services, there were two other industries in which employed women also had high median ages. These were laundry, cleaning, and other garment services (44.5 years) and hotels and lodging places (43.8 years).

There were only two industries in which the median age of employed women was less than 30 years. These were air transportation (27.0 years) and communications (29.7 years).

Men working in two major industry groups, finance, insurance, and real estate and professional and related services, earned more on the average than men in other major industry groups. The median earnings in 1969 for these major groups were $9,914 and $9,190, respectively, compared to median earnings of $8,517 for all men. At $10,768, the insurance industry had the highest median in its major group. The industry "other professional services" had a median of $12,353 which was the highest in its major group. This industry includes accounting, legal, engineering, and architectural services. All median earnings figures cited are for 1969 and relate to persons who worked 50 to 52 weeks in 1969. Two other major groups had relatively high median earnings: public administration ($9,002) and transportation, communications, and other public utilities ($8,949). Although the major group business and repair services had a median of $8,149, which was slightly below the national average, two industries within the major group were among those with the highest median earnings. These industries were advertising ($12,636) and commercial research, management, and programming services ($12,192).

The median earnings for the major group agriculture, forestry, and fisheries was the lowest of all major groups at $4,893; over 96 percent of the employment in that major group is accounted for by the agriculture industry for which the median earnings was $4,817. The major industry group with the second lowest median ($6,374) was personal services.

The median earnings for women were consistently lower than those for men. In 1969, the median earnings for women was $4,715 as compared with $8,517 for men.

Women in the public administration industry had the highest median earnings of any of the 12 major groups ($6,169). Two of the industries in that major group, Federal public administration ($6,720) and postal service ($6,612), were among the industries with high median earnings. Other industries with high median earnings in 1969 included aircraft and parts manufacturing ($6,865), motor vehicles and motor vehicle equipment manufacturing ($6,763), and air transportation ($6,660). Although median earnings for the professional and related services major industry group were but $5,050, over one-half of the 1 million women who earned more than $10,000 in 1969 were employed in industries comprising that major group. A majority of these women with high earnings were working in educational services.

Among major industry groups, the median earnings for women were lowest for personal services ($2,611). Women in the private household industry, which employed about 40 percent of all women in personal services, had the lowest median earnings of any industry ($1,488). However, the median earnings for women for all industries in this major group were relatively low.

EMPLOYED

Employed persons comprise all civilians 16 years old and over who were either (a) "at work"--those who did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a family farm or in a family business; or (b) "with a job, but not at work"--those who did not work during the reference week, but had jobs or businesses from which they were temporarily absent due to illness, bad weather, industrial dispute, vacation, or other personal reasons. Excluded from the employed are members of the Armed Forces and civilians whose only activity consisted of work around the house or volunteer work for religious, charitable, and similar organizations.

INDUSTRY

For employed persons the data on industry refer to the job held during the reference week. For persons employed at two or more jobs, the data refer to the job at which the person worked the greatest number of hours. The industry sta-

tistics presented here are based on the detailed system developed for the 1970 census; see 1970 Census of Population, **Classified Index of Industries and Occupations,** U.S. Government Printing Office, Washington, D.C., 1971.

EARNINGS

Earnings are wage and salary income received for work performed as an employee or self-employment income. The median earnings figure is that which divides the distribution into two equal parts, one-half receiving higher earnings and one-half receiving lower.

MEDIAN AGE

The median age is that age which divides the distribution into two equal parts, one-half being older than the median age and one-half younger.

SPANISH HERITAGE

In the State reports, the definition of Spanish heritage was as follows: In 42 States and the District of Columbia, it referred to "Persons of Spanish language;" in five Southwestern States, "Persons of Spanish language or Spanish surname;" and in the three Middle Atlantic States, "Persons of Puerto Rican birth or parentage." Persons of Spanish language comprise persons of Spanish mother tongue (i.e., the language spoken in the person's home when he was a child) and all other persons in families in which the head or wife reported Spanish as his or her mother tongue. See Series PC(S1)-30 for a more detailed description of the several criteria used to identify the population of Spanish heritage.

SAMPLE SIZE

Data for total and Negro are based on a 20-percent sample, those for persons of Spanish heritage on a 15-percent sample. A description of the sample design and information on sampling variability appears in the Final Report PC(1)-D1, **United States Summary.**

SYMBOLS

A dash "-" signifies zero.

Table 239. Age of Employed Persons by Industry and Sex: 1970

A UNITED STATES DEPARTMENT OF COMMERCE PUBLICATION

1970 CENSUS OF POPULATION

PC(S1)-45
June 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Patterns of Commuting in Large Metropolitan Areas: 1970

(The table presented here is a preprint of table 363 from the Final Report PC(1)-D1, **Detailed Characteristics, United States Summary**, which contains additional summary information on the detailed characteristics of the population as well as more detailed technical explanations)

In 1970, 7.7 million workers, or 30 percent of the 26 million workers who lived in standard metropolitan statistical areas (SMSA's) of 250,000 or more, but outside central cities, worked in these central cities. At the same time, however, about 3 million, or 15 percent, of the 21 million workers living in the central cities commuted to jobs in the surrounding suburban areas. Commuting, then, is not merely a matter of movement from suburbs to central cities, but involves an interchange of workers between these components of metropolitan areas.

The proportion of workers who lived in the outlying suburban areas but worked in the central cities varies considerably from area to area. In the New York and Chicago SMSA's roughly one-quarter of the workers living in suburban areas worked in their respective central cities. For the Philadelphia area this proportion drops to 19 percent, but for the Washington, D.C. area rises to 30 percent. Among the smaller SMSA's this percentage may be considerably larger. In the Austin, Texas SMSA, for example, nearly 60 percent of the workers living outside the central city worked in the central city.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 20 cents domestic postpaid or 10 cents G.P.O. Bookstore.

Workers Living in SMSA's of 250,000 or More by Place of Work: 1970

Place of work	All workers living in specified SMSA's		Living in central cities		Living outside central cities	
	Number	Percent	Number	Percent	Number	Percent
Total	47,221,624	100.0	21,183,157	100.0	26,038,467	100.0
Working in SMSA of residence:						
Central cities	23,282,129	49.3	15,580,507	73.6	7,701,622	29.6
Outside central cities	18,153,121	38.4	3,102,806	14.6	15,050,315	57.8
Working outside SMSA of residence	2,424,157	5.1	660,496	3.1	1,763,661	6.8
Not reported	3,362,217	7.1	1,839,348	8.7	1,522,869	5.8

In general, it should be recognized that since SMSA's and central cities are defined in terms of political subdivisions (counties, townships, cities) the counts of workers by residence and workplace may be considerably affected by the relationship of the boundaries of these units to the distributions of residence and places of employment. An outstanding example of this situation is the Jacksonville, Florida SMSA which consists of a single county and where the city and the county are now administratively coextensive; in consequence, there are no workers either living or working outside the central city.

A substantial number of the 2.4 million workers who work outside their SMSA of residence travel to work in another SMSA adjacent to the one in which they live. Likewise, some of the 660,000 central-city residents who work outside their own SMSA actually are employed in another central city in an adjacent SMSA.

STANDARD METROPOLITAN STATISTICAL AREAS

Except in the New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the SMSA. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities.

The SMSA's for which data are presented here are selected from the 243 SMSA's in the United States recognized in the publications of the 1970 census.

PLACE OF WORK

Although the questions on place of work were asked of all persons 14 years old and over, the data presented here are for persons 16 years old and over.

Place of work refers to the geographic location at which civilians at work during the census week and Armed Forces personnel (except those on leave, sick, etc.) carried out their occupational or job activities.

For the purpose of this report, these locations are classified as follows: (1) central city (or cities) of the SMSA, divided into the central business district, and elsewhere in the central city; (2) the remainder (or outlying parts) of the SMSA; and (3) the area outside the SMSA.

SAMPLE SIZE AND SYMBOLS

Table 363 is based on the 15-percent sample. A dash "—" signifies zero or, in the "Central Business District" column of the table, not applicable.

Table 363. **Place of Work During the Census Week for Standard Metropolitan Statistical Areas of 250,000 or More: 1970**

[Data based on sample, see text. For meaning of symbols, see text]

1970 CENSUS OF POPULATION

PC(S1)-46
June 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Lifetime and Recent Migration by Educational Attainment for the United States: 1970

(The data presented here are reprinted from tables 2 and 12 of Final Report PC(2)-2D, Lifetime and Recent Migration, which contains additional information on State of birth and State of residence in 1965, cross-classified with age, race, employment status and major occupation group, income in 1969, children ever born, and enrollment status and relative progress of children in school)

In this report State (or division) of birth is compared with State (or division) of residence in 1965 and State of residence in 1970. Column 2 of table 2 shows persons who were living in their State of birth in 1965 and 1970 -- indicating a relatively high degree of residential stability. At the opposite extreme were persons who were living outside their State of birth in 1965 and in still another State in 1970 (column 5).

The likelihood of being in the category indicating repeated interstate migration (living outside State of birth and in different States in 1965 and 1970) is highly associated with age. The data in table 2 reveal that among native men 25-29 who reported State of birth and residence in 1965, 8.2 percent were in the category indicating repeated interstate migration. This percentage decreases steadily at later age groups, being 6.8 at ages 30-34, 5.0 at ages 35-44, 2.4 at ages 45-64, and 1.8 among men 65 and over. These percentages give an indication of the high propensity of persons in their twenties to undertake repeated interstate migration.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 25 cents domestic postpaid or 15 cents G.P.O. Bookstore.

The likelihood of being in the category indicating repeated interstate migration is also highly associated with educational attainment. The data in table 2 show that among native men 25-29 who reported State of birth and residence in 1965, only 2.5 percent of those with less than eight years of school completed were in the category indicating repeated interstate migration, but 19.0 percent of the men at this age with five or more years of college were in this category. In other words, the likelihood of being in the category indicating repeated interstate migration was between seven and eight times greater for men with the highest educational level than for men with the lowest educational level at the 25-29 age group. These percentages give an indication of the high propensity of the well-educated toward repeated interstate migration.

Table 12 can be used to give an indication of how return migration varies from division to division. The number of 1965-70 inmigrants who were returning to their division of birth can be expressed as a percent of all 1965-70 inmigrants (excluding persons born abroad or who were abroad in 1965 as well as persons failing to report birthplace or residence in 1965). According to this measure, return migrants 25-64 years old among other inmigrants from the U.S. were numerically most important for the East South Central division, constituting 49.7 percent of all 25-64-year-old 1965-70 inmigrants to that division. Return migrants among other inmigrants from the U.S. were numerically least important for the Pacific division, constituting only 13.6 percent of all 25-64-year-old 1965-70 inmigrants to that division.

The relative representation of return migrants among all migrants varies markedly according to education for the East South Central and West South Central divisions. For these two divisions, return migrants constitute the bulk of inmigrants with limited educational levels but only a relatively small proportion of the well-educated. For example, for the East South Central division, return migrants constituted 75.5 percent of all 25-64-year-old 1965-70 migrants from other parts of the U.S. who had completed less than eight years of school but only 29.7 percent among inmigrants with four or more years of college.

DEFINITIONS AND SAMPLE SIZE

The data are based on a 15-percent sample and are, therefore, subject to sampling variability. Definitions and technical explanations for the statistics presented here, as well as information on sampling variability, appear in Final Report PC(2)-2D, **Lifetime and Recent Migration.**

Table 2. **Place of Birth and State of Residence in 1965 and 1970 of the Total and Negro Population 25 Years Old and Over by Age, Sex, and Years of School Completed: 1970**

(Data based on 15-percent sample, see text. For meaning of symbols, see text.)

SUPPLEMENTARY REPORT

Characteristics of Negro Inmigrants to Selected Metropolitan Areas: 1970

The tables in this report show birthplace and residence in 1965 for the Negro population in the six standard metropolitan statistical areas (SMSA's) which contained a central city with 500,000 or more Negro population at the time of the 1970 census.

The tables show that Southern-born blacks living in the six metropolitan areas generally are slightly more likely to be married and living with their spouse than Northern-born blacks. For example, among black males 18 and over living in the Chicago SMSA in 1965 and 1970, 51.2 percent of those born in Illinois (column 2 of table 1) were in the category "married, spouse present," compared to 69.6 percent of those born in the South (column 6). The relatively high proportions married and living with their spouse among the Southern-born were due primarily to a low proportion single (never married); of black males 18 and over who were born in Illinois and living in the Chicago SMSA in 1965 and 1970, 31.9 percent reported never having been married, compared to 11.1 percent among the Southern-born black males 18 and over living in the Chicago SMSA in 1965 and 1970.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 45 cents domestic postpaid or 30 cents G.P.O. Bookstore.

In addition to higher rates of marriage, the tables reveal higher rates of marital fertility among Southern-born black women in the six SMSA's. For example, ever married black women 15-24 years old who were born in Michigan and living in the Detroit SMSA in 1965 and 1970 reported 1,308 children ever born per 1,000 women, compared to 1,612 children ever born per 1,000 women ever married for the Southern-born black women 15-24 living in the Detroit SMSA in 1965 and 1970. A similar pattern prevails at later ages for the Detroit SMSA and for the other SMSA's.

An important fertility difference exists between the early migrants from the South (those who moved before 1965) and the recent migrants from the South (those who moved since 1965). Among black women under 35 years of age, the recent migrants have *lower* fertility than the early migrants, but among women over 35 the recent migrants generally have *higher* fertility than the early migrants. In the Detroit SMSA, for example, Southern-born black women 15-24 who were living in the Detroit SMSA in 1965 (the early migrants) reported 1,612 children ever born per 1,000 women ever married, compared to 1,401 children ever born per 1,000 women ever married among the 15-24-year-old black women living in the South in 1965 (the recent migrants). A similar pattern exists for women 25-34 years old. But black women over 35 who recently moved from the South spent most of their childbearing years in the traditionally high-fertility South and reported more children ever born than black women who had spent most of their childbearing years in metropolitan areas outside the South. In Detroit, black women 35-44 who were born in the South but living in the Detroit SMSA in 1965 reported 3,679 children ever born per 1,000 women ever married; among more recent black migrants from the South, there were 4,794 children ever born per 1,000 ever married women 35-44 years old. At this age, therefore, the fertility difference between early and recent black migrants amounts to more than one child per ever married woman.

One may also note that in the six SMSA's the Southern-born black males generally have slightly higher labor force participation rates than the Northern-born. In the New York City SMSA, for example, among black men 16 years old and over those born in New York State and living in the New York City SMSA in 1965 reported labor force participation rates of 65.2 percent, compared to 78.4 percent among the early migrants from the South, and 81.5 percent for the recent migrants from the South.

DEFINITIONS

The statistics presented here are drawn from the tabulations made for 1970 census Final Report PC(2)-2C, which contains more detailed definitions and technical explanations. This type of information also appears in the Series PC(1)-C and PC(1)-D final reports.

SAMPLE SIZE

Data in this report are from a 15-percent sample and are, therefore, subject to sampling variability. A description of the sample design and information on sampling variability appear in the PC(2)-C, **Mobility for Metropolitan Areas.**

SYMBOLS

A dash "-" signifies zero. Three dots "..." mean that the base for the derived figure is too small for it to be shown.

Table 1. **Birthplace and Residence in 1965 of the Negro Population of the Chicago, Ill., Standard Metropolitan Statistical Area, According to Marital and Family Status, Children Ever Born, Employment Status, and Education by Income in 1969: 1970**

1970 CENSUS OF POPULATION

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Interstate Migration by State: 1970

(The data presented here are from tables 23, 44, and 45 of Final Report PC(2)-2B, **Mobility for States and the Nation**, which contains additional information on mobility status between 1965 and 1970 cross-classified with various social and economic characteristics)

Most native white men living in the North in 1970 were born in the North (the Northeast and North Central regions), but a high proportion of native black men living in the North in 1970 were born elsewhere (most often in the South). Among native men 25 years old and over living in the North in 1970, 87.8 percent of whites were born in the North, compared to 37.1 percent among blacks. Only 5.8 percent of native white men 25 years old and over living in the North were born in the South, but nearly one-half (49.2 percent) of northern black men 25 years old and over were born in the South.

Educational attainment of men in the North varies according to region of birth. For both white and black men, those born in and living in the North had higher levels of educational attainment than the Southern-born but lower levels than the Western-born. Among native white men 25 years old and over and living in the North in 1970, 57.3 percent of those born in the North had completed at least high school, compared to 76.3 percent among white men born in the West, and 45.6 percent among white men born in the South. Among native black men 25 years old and over living in the North in 1970, high school graduates constituted 43.8 percent among the Northern-born, 54.6 percent among the

Western-born, and 30.9 percent among the Southern-born.

Tables 44 and 45 show streams of migration to and from each State between 1965 and 1970. These data show that during this period the South experienced net inmigration, a reversal of a long-standing pattern. The West also experienced net inmigration, with the Northeast and North Central regions losing population to the South and the West.

The South continued to experience net outmigration of blacks, however. Among blacks leaving the South there is still a tendency to move North via the most northerly route. For example, among blacks who moved out of Mississippi between 1965 and 1970, over one-third (35.8 percent) went to Illinois and Michigan, but among blacks leaving South Carolina, 41.1 percent chose New York, New Jersey, and Pennsylvania as their destination.

DEFINITIONS AND SAMPLE SIZE

The data are from a 15-percent sample and are therefore subject to sampling variability. Definitions and technical explanations for the statistics presented here, as well as information on sampling variability, may be found in Final Report PC(2)-2B, **Mobility for States and the Nation.**

SYMBOLS

A dash "-" signifies zero.

Table 23. **Region of Birth of Native White and Native Negro Males 25 Years Old and Over Living in the North by Age, Years of School Completed, and Income in 1969: 1970**

[Data based on 15-percent sample, see text. For meaning of symbols, see text]

1970 CENSUS OF POPULATION

PC(S1)-49
June 1973

U. S. DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

SUPPLEMENTARY REPORT

Social and Economic Characteristics by Detailed Industry for the United States: 1970

(The tables presented here are preprinted from the Final Report PC(2)-7B, **Industrial Characteristics**, which contains statistics on industry classified by various social and economic characteristics of workers as well as more detailed technical explanations. Each column of derived data presented in these two tables was summarized from a table in the report showing the distribution for that subject)

Men in the experienced civilian labor force in 1970 had, on the average, completed a high school education (median of 12.3 years of school completed). Among the 12 major industry groups, men in agriculture, forestry, and fisheries had the lowest median (10.1 years), and men in professional and related services had the highest (16.3 years).

For women in the experienced civilian labor force in 1970, the median number of school years completed was 12.4. The median school years completed by women in the major industry groups ranged from a low of 10.7 years in personal services to 12.9 years in professional and related services.

Of the 50 million men in the experienced civilian labor force, 73 percent worked 50 to 52 weeks in 1969. The number of weeks worked includes paid vacations and paid sick leave. Nearly 86 percent of the men in the major industry group public administration worked 50 to 52 weeks, the highest rate of the 12 major industry groups. Men in the major industry group entertainment and recreation services had the lowest proportion who worked 50 to 52 weeks (52 percent).

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 25 cents domestic postpaid or 15 cents G.P.O. Bookstore.

Of working women in the experienced civilian labor force, 53 percent worked 50 to 52 weeks. With 71 percent, mining had the highest proportion working year round of any of the 12 industry groups. As was true for men, the major industry group with the smallest proportion of women working year round was entertainment and recreation services, with 40 percent working 50 to 52 weeks.

DEFINITIONS AND SAMPLE SIZE

The data are from a 5-percent sample, and are therefore subject to sampling variability. Definitions and technical explanations for the statistics presented here, as well as information on sampling variability may be found in Final Report PC(2)-7B, **Industrial Characteristics.**

SYMBOLS

A dash "-" signifies zero.

Table 1. **Social and Economic Characteristics of the Experienced Civilian Labor Force by Detailed Industry, and Sex: 1970**

(Data based on 5-percent sample, see text. For minimum base for derived figures (percent, median, etc.) and meaning of symbols, see text)
