MONEY INCOME IN 1974 OF FAMILIES AND PERSONS IN THE UNITED STATES

(Advance data on the 1974 income of families and persons were issued in July 1975 in Current Population Reports, Series P-60, No. 99)

As indicated in our advance report on family income, the 7 percent increase in median family income ($12,840) from 1973 to 1974 was less than the rise in prices, resulting in a net loss in real purchasing power. After adjusting for the 11 percent increase in prices between 1973 and 1974[1], the 1974 median decreased by about 4 percent below the 1973 median expressed in terms of constant dollars.

Although the real median income for all families declined between 1973 and 1974, it did not decline for families in which the head worked year round full time. The median income of the latter group was $16,070 in 1974, not significantly different from the 1973 median in real terms.

Both white and black families[2] experienced a decline in real median income between 1973 and 1974. The median income of white families was $13,360 in 1974, a decrease of about 4 percent below their 1973 median when expressed in constant dollars. Similarly, black median family income, estimated at $7,810 in 1974, decreased by approximately 3 percent in real terms, not significantly different than for whites.

Of the 55.7 million families (including families with civilian or military heads) in the United States as of March 1975, 6.4 million or 11.5 percent received incomes of $25,000 or more in 1974. There were 15.8 million families (28.3 percent) with incomes between $15,000 and $25,000; 13.6 million families (24.4 percent) with incomes between $10,000 and $15,000; 12.7 million families (22.7 percent) with incomes between $5,000 and $10,000; and 7.3 million families (13.1 percent) with incomes less than $5,000 in 1974.

Both the increase in the number of families and in money income between 1973 and 1974 contributed to the growth in aggregate family income. Aggregate family income increased by 7.7 percent between 1973 and 1974, stemming from a 1.2 percent increase in the number of families (660 thousand net additional families) and a 6.5 percent increase in mean income per family. However, aggregate family income in constant 1974 dollars was down 2.9 percent in 1974 compared with 1973. Aggregate family money income amounted to $807.9 billion in 1974.

Aggregate income in 1974 was found to be distributed among families as follows: The lowest fifth of families, ranked by size of their 1974 income, received 5.4 percent of the aggregate money income of families; the second fifth received 12.0 percent; the third fifth

Table A. Number of Families and Unrelated Individuals, by Total Money Income in 1974

(Families and unrelated individuals as of March 1975)

Total money income	Number of--	
	Families	Unrelated individuals
Total.....	55,712,000	18,872,000
Under $1,000.....	702,000	1,189,000
$1,000 to $1,999...	766,000	2,171,000

$3,000 to $3,999...	2,040,000	2,175,000
$4,000 to $4,999...	2,305,000	1,526,000
$5,000 to $5,999...	2,475,000	1,375,000
$6,000 to $6,999...	2,478,000	1,202,000
$7,000 to $7,999...	2,501,000	1,025,000
$8,000 to $8,999...	2,574,000	906,000
$9,000 to $9,999...	2,629,000	707,000
$10,000 to $10,999.	2,920,000	1,185,000
$11,000 to $11,999.	2,782,000	
$12,000 to $12,999.	2,859,000	
$13,000 to $13,999.	2,632,000	1,047,000
$14,000 to $14,999.	2,388,000	
$15,000 to $19,999.	10,032,000	923,000
$20,000 to $24,999.	5,755,000	
$25,000 to $49,999.	5,771,000	166,000
$50,000 and over...	614,000	43,000
Median income.....	$12,836	$4,439
Mean income.....	$14,502	$6,059

[1] The percentage increase in prices between 1973 and 1974 is computed by dividing the annual average Consumer Price Index (CPI) for 1974 by the annual average value of the Index for 1973.

[2] The decline for black families is statistically significant at the 90 percent confidence level. See section on "Source and Reliability of the Estimates" in the appendix.

received 17.6 percent; the fourth fifth received 24.1 percent; and the highest fifth received 41.0 percent. The top 5 percent of families received 15.3 percent of the aggregate income while all families below the median family income ($12,840) received 25.5 percent.

The survey showed that of all persons 14 years old and over, about 93 percent of the men and 71 percent of the women received income in 1974. Men and women who were income recipients in 1974 had median incomes of $8,380 and $3,080, respectively. The 1974 median income for men, expressed in real terms, showed a decline of about 6 percent below the 1973 median. In contrast, the real median income for women did not show a statistically significant change between 1973 and 1974.

Between 1973 and 1974, the proportion of male income recipients who were year-round full-time workers declined from 58 to 56 percent. The proportion for comparable women was about 30 percent in 1974, not significantly different from 1973. For men working year round full time, the median income was $12,150 in 1974. This represents a decline of about 5 percent in real terms below the 1973 median for comparable men. The median income for women working year round full time was $6,960 in 1974, or about 3 percent below the 1973 median in real terms. However, the difference between these rates of decline in the median income for men and women was not statistically significant.

These are some of the highlights obtained from the Census Bureau's Current Population Survey (CPS) of March 1975. The survey results cover both the civilian noninstitutional population and an estimated 1,064,000 persons who were members of the Armed Forces living off post or with their families on post in the United States. The 1975 survey shows that there were about 209,343,000 persons, of whom 55,712,000 were family heads, 134,759,000 were other family members, and 18,872,000 were unrelated individuals, i.e., persons living alone or not related to others in the household including those under 14 years old.

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. For further details, see below and page 169.

Data on consumer income collected in the CPS are limited to money income received before payments for personal income taxes and deductions for Social Security, union dues, Medicare premiums, etc. Money income is the sum of amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income.[3] Underreporting tends to be more pronounced for income sources that are not derived from earnings, such as Social Security, public assistance, and net income from interest, dividends, rentals, etc. Overall, income earned from wages or salary is much better reported than other sources of income and, when dollar imputations are assigned for nonreporting, wage and salary income is nearly equal to independently derived estimates.

SELECTED FAMILY INCOME CHARACTERISTICS

Type of family. In March 1975, about 84 percent of all families were husband-wife families, approximately 3 percent were headed by a male with no wife present, and the remaining 13 percent were headed by a female. The median income in 1974 of all husband-wife families was $13,350. For husband-wife families with wives in the paid labor force the median income was $16,460, or 36 percent higher than the median income for husband-wife families in which the wives were not in the paid labor force.

There were about five times as many families headed by a female (7.2 million) as there were families headed by a male with no wife present (1.5 million). The median income in 1974 of families headed by a female ($6,400) was slightly more than one half (55 percent) of the median income of families headed by a male with no wife present ($11,740).

---

[3] The accuracy of reported and imputed CPS earnings and property income is discussed in a forthcoming paper, "Measuring the Impact of Family Income Statistics of Reporting Differences Between the Current Population Survey and Administrative Sources," by Roger A. Herriot and Emmett F. Spiers, to be published in American Statistical Association, **Proceedings of the Social Statistics Section**, 1975.

About 30 percent of all families headed by a female had incomes below $4,000 in 1974, compared with 11 percent for male heads with no wife present. Approximately 6 percent of the husband-wife families had incomes below $4,000. The reverse order is observed for families with incomes above $15,000--about 44 percent for husband-wife families, 35 percent for male heads with no wife present, and 12 percent for families headed by a female. (See table B.)

Between 1973 and 1974, the median income of husband-wife families decreased by about 4 percent in real terms. No significant decrease occurred, however, for families headed by a male with no wife present or families headed by a female.

The percentage of husband-wife families with wives in the paid labor force among all husband-wife families has increased from 39 percent in 1970 to 43 percent in 1974. Over the same time period, the real median income for husband-wife families with wives in the paid labor force increased by about 6 percent compared to an increase of about 2 percent for husband-wife families with wives not in the paid labor force.

Number of earners. Median family income is highly correlated with the number of earners per family. The median income for the 8.0 million families with three or more earners was $20,460 in 1974 as compared with medians of $14,750 for the 22.0 million families with two earners and $10,960 for the 19.6 million families with one earner. The remaining 6.2 million families with no earners had a median income of $4,840. Viewing changes in median income from 1973 to 1974, families with one, two, and three or more earners experienced a decline in real income while families with no earners did not. In 1974, 74 percent of the families with three or more earners had incomes above $15,000 while only 49 percent for two-earner families and 28 percent for one-earner families were above this level.

Educational attainment of head. There is a strong positive relationship between educational attainment and income. For example, although approximately 12 percent of all families with heads 25 years old and over received incomes of $25,000 or more, about one in three families whose head completed 5 or more years of college education had incomes of $25,000 or more while for families whose head had completed 4 years of college, about 28 percent received $25,000 or more. About 10 percent of the families whose heads completed their education at the high school level received $25,000 or more in 1974. (See table 36.) Higher educational attainment of the family head, however, is no guarantee of higher family income. For example, 29 per-

cent of families whose head completed 4 years of college received less than the median income ($13,940) for families headed by high school graduates.

Age of head. There is also a strong relationship between the age of the family head and income. Family life cycle studies indicate that income generally increases with age up to a certain age level and then gradually declines in the upper age brackets. The data for 1974 show that the median income of families with a head between 14 and 24 years old was $8,620. (See table 25.) The median increases with age reaching a peak of $16,710 for families with heads in the 45 to 54 age bracket. The age group having the lowest median income ($7,300) is for families whose head was 65 years old and over. Moreover, both the young and old age groups tend to be overrepresented in the lower fifths of families and underrepresented in the upper fifths while the middle age groups reflect the opposite situation, as shown in table 18. Thus, in 1974, 35 percent of families with a head between 14 and 24 years of age were in the lowest fifth of all families while 2 percent were in the highest fifth. Of families with a head between 45 and 54 years old, 11 percent were in the lowest fifth while 33 percent were in the highest fifth. Finally, of the families with a head 65 years old and over, 44 percent were in the lowest fifth while 8 percent were in the highest fifth.

Work experience of head. Although more and more families derive their income through the efforts of both the family head and other family members, in most instances the work experience of the family head is still the principal factor in shaping the level of family income. In March 1975, there were 54.8 million families headed by a civilian, of whom 45.1 million worked at some time during 1974, 34.2 million (or 76 percent) worked 50 to 52 weeks at full-time jobs while 3 percent worked year round at part-time jobs. There were approximately 9.6 million families, 58 percent of which were 65 years or older, in which the head did not work at all during 1974.

From 1973 to 1974, the median income ($14,320) of families whose head worked decreased in real terms by 4 percent, while the median income ($5,950) of families whose head did not work did not change significantly. During the same time period, the median income ($14,790) for families whose head worked at full-time jobs decreased in constant dollars by 4 percent, whereas the median income ($7,600) for families whose head worked part-time at their longest job did not change significantly. Among families whose head worked year round full time, however, the median income ($16,070) did not decrease in real terms.

Source of income. Although earnings comprise the largest source of family income, only about 28 percent of families indicated that their only source of income in 1974 was from earnings (wages, salaries and/or self-employment income). Sixty-one percent had other types of income in addition to earnings; e.g., interest, dividends, unemployment compensation, and pensions, and the remaining 11 percent indicated they had income only from nonearned sources. (See table 49.)

The median income of families with wages and salaries only, was about $12,550 in 1974, as contrasted with a median of $14,600 for families having both wages or salary and income other than earnings. Families with income solely from unearned sources had a median income of $4,920.

About 43 percent of the families with incomes under $4,000 in 1974 derived all of their income from unearned sources. This proportion was about 11 percent for families in the $7,000 to $10,000 income class interval, and about 1 percent for families at the $25,000 and over level.

Between the income class intervals of $4,000 and $10,000, the proportion of families with income only from earnings rose from 20 percent of all families in the $4,000 to $4,999 category to 37 percent in the $9,000 to $9,999 interval. However, as family income moves into higher income intervals, there are proportionately fewer families which have only earnings. About 28 percent of families in the $15,000 to $24,999 bracket received only earnings, but for families with incomes of $50,000 or more, as few as 11 percent were solely dependent on earnings.

For the 15.5 million families who received income from earnings only, the 1974 median income ($12,450) represented a decrease in real terms of about 6 percent below the 1973 median. The median income ($14,700) for the 34.0 million families with earnings and other income decreased by an amount (4 percent) similar to families with earnings only. For those 6.0 million families who had no earnings, however, the 1974 median income ($4,920) did not change significantly from the 1973 median in real terms.

From 1973 to 1974, appreciably different decreases in real median income occurred among the families with different types of earnings. For the 47.0 million families who reported money wages or salary, the 1974 median income of $12,460 represented a decrease of about 4 percent in constant dollars. The median income decreased in real terms about 17 percent to $4,340 for the 6.5 million families who reported earnings from nonfarm self-employment. The median income of $1,510 for 2.6 million families reporting earnings from farm self-employment, however, was about 36 percent lower than the 1973 value in constant dollars.

Region. Over the past several years, there has been a narrowing of the gap in income between families living

in the South as opposed to the non-South.[4] (See section in this text on, "Long Term Trends in Real Family Income.") However, a sizeable gap in income between the two areas still exists. In 1974, the 18.1 million families living in the South had a median income of $11,230, or 82 percent of the median income ($13,620) for the 37.6 million families living in the non-South.

Between 1973 and 1974, the median income of families living in all four regions (Northeast, North Central, South, and West) showed a decline in real terms (See table 12). The South, however, was the only region where the real median income for families headed by a year-round full-time worker decreased between 1973 and 1974.

Metropolitan-nonmetropolitan residence. In 1974, the highest family median income ($16,320) was associated with suburban families of large metropolitan areas (population of one million or more), while the lowest median income ($9,990) was associated with farm families located outside metropolitan areas. The median income for the 8.4 million families residing in central cities of large metropolitan areas was approximately 74 percent of the median income for the 12.9 million suburban families of these metropolitan areas. In smaller metropolitan areas (with a population of less than one million), the median income for the 7.6 million central city families was about 88 percent of the $13,620 median income for the 8.8 million suburban families.

The 1974 data also reveal that the median income of families in metropolitan areas was about 25 percent greater than the median income received by families in nonmetropolitan areas—$13,770 versus $11,050; suburban families in larger metropolitan areas had a higher median income (about 20 percent greater) than suburban families in smaller metropolitan areas; and that in nonmetropolitan areas the median income for the 16.0 million nonfarm families ($11,150) was approximately 12 percent higher than the median income for the 1.9 million farm families.

Of families living in metropolitan and nonmetropolitan areas, only suburban families of large metropolitan areas (population of one million or more) did not experience a decline in real median income from 1973 to 1974.

LONG TERM TRENDS IN REAL FAMILY INCOME

As mentioned earlier, the 1974 median family income ($12,840) represents a decline of about 4 percent below the 1973 median expressed in terms of constant dollars. This is one of the largest single year declines in the constant dollar median family income since income data were first collected in the CPS in 1947, reflecting not only an economy buffeted by the most severe post-war recession, but one subjected also to a particularly sharp inflation unparalleled in recent memory.

Changes in both real and current dollar median family income from 1947 to 1974 are depicted in the graph on the front cover of this report. As shown by this figure, median family income in current dollars increased by about 325 percent[5] between 1947 and 1974 (from $3,030 to $12,840). However, much of the increase in median family income was eroded by increases in prices, which have been pronounced during the past few years. Referring to the front cover, the gap between the current and constant dollar median family income series represents the increase in prices. Nevertheless, median family income in constant 1974 dollars has shown an increase of approximately 92 percent between 1947 and 1974, from $6,690 to $12,840. This amounts to an average annual increase[6] of about 2.5 percent per year during the 1947-74 period.

One noticeable aspect of the graph on the front cover is the slower growth in real median family income after 1969. From 1947 to 1969, real median family income increased by 90 percent, from $6,690 to $12,690; this represents an average annual growth of 3.0 percent per year. However, from 1969 to 1974, real median family income showed sporadic movement. The net effect of these movements during the past five-year period was an increase of only 1.2 percent in real median family income (from $12,690 to $12,840) or an average annual growth rate near zero.

The changes in real family income from 1947 to 1974 are more fully seen by looking at an income distribution rather than the median income alone. Referring to table C, which shows cumulative percentage distributions of real family income, it is clear that the entire distribution of family income has shifted over time. For instance, the proportion of families with incomes less than $3,000, in constant 1974 dollars, has decreased from 17 percent in 1947 to about 5 percent in 1974. At the other end of the scale, about 92 percent of all families had incomes under $15,000 in 1951 (detailed data above $10,000 were not tabulated from the CPS prior to 1951) compared to 60 percent of families in 1974. As can be seen from table C, the same general pattern of change in the distribution held true for income intervals between $3,000 and $15,000.

[4] Non-South here refers to the Northeast, North Central, and West Regions combined.

[5] This is seen as the difference between the index in 1974 (= 425) and the index in 1947 (= 100).

[6] The average annual increase was computed by summing the year-to-year changes in real median family income from 1947 to 1974 and then dividing this sum by the number of years minus one.

Table C. Families by Total Money Income in 1947 to 1974, in Constant Dollars

(In 1974 dollars. Families as of March of the following year)

Year	Number (thousands)	Cumulative percent distribution							Median income	
		Total	Under $3,000	Under $5,000	Under $7,000	Under $10,000	Under $12,000	Under $15,000	Amount (dollars)	Index (1947=100)

Regional Comparisons. Income changes in the four major regions (Northeast, North Central, South, and West) reflect endogenous changes as well as interregional migration. Distilling the separate influences of the two sets of factors, however, is difficult. For instance, a strong outmigration of low income southerners could have the effect of raising median income in the South and lowering the median in non-South regions. Furthermore, since income in the South tends to be lower than the non-South, the relative income position of southern outmigrants will be lower unless they experience a commensurate increase in income after moving. The net effect of these influences will depend upon the flows of inmigration and outmigration among regions in addition to the relative income position of the migrant before and after moving.[7] These considerations should be kept in mind, in the following regional comparisons of income.

In 1953,[8] the South lagged behind the other three regions in the level of real median family income, and this situation still prevailed in 1974. Yet, as shown in table D, the South experienced the largest rate of increase in real median family income (about 84 percent) between 1953 and 1974 (from $6,110 to $11,230). The Northeast and North Central regions experienced similar percentage increases (about 63 percent) in real median family income with the Northeast increasing from $8,440 to $13,800 and the North Central region increasing from $8,440 to $13,740. Real median family income grew the slowest (about 55 percent) in the West, from $8,490 in 1953 to $13,160 in 1974. Viewed alternatively, the average annual increase in real median family income from 1953 to 1974 was 2.4 percent in both the Northeast and North Central regions, 2.2 percent in the West and 3.0 percent in the South.

Increases in real income during the 1953 to 1974 period did not occur uniformly in the four major regions. For instance, during the past decade the South experienced a much more rapid growth in real median family income than the non-South regions. The CPS data show that from 1965 to 1974, real median family income in the South increased by 28 percent compared to 16 percent in the Northeast and 20 percent in the North Central region. Families in the West experienced the slowest growth (9 percent) in real median income during this period. In contrast, families in the North Central region experienced the slowest growth (29 percent) in real median family income from 1953 to 1964. During this period, real median income increased by about 36 percent in the Northeast region and by a similar amount in the West (about 37 percent) and in the South (about 39 percent).

The cumulative percentage distributions of real family income by region show much the same general pattern of change over time as the distribution for the total United States (see tables C and D). The entire distribution of income has shifted over time, however, the rates of change vary by region. One aspect of this

[7] Research on this subject has indicated that past interregional migration has played an important role in the reduction of the income differential between the South and non-South regions. A discussion of this topic can be found in: Gwartney, James. "Changes in the Nonwhite/White Income Ratio-1939-67." **American Economic Review 60** (December 1970): 872-83.

[8] Income data by region were not tabulated from the Current Population Survey prior to 1953.

Table D. Families By Total Money Income In 1953 To 1974, In Constant Dollars, By Regions

(In 1974 dollars)

Region and year	Total	Cumulative percent distribution						Median income

change has been the reduction in the disproportionately large number of southern families in the lower part of the income distribution. In 1953, about 42 percent of all southern families received an income of less than $5,000 per year (see table D). In contrast, about 22 percent of families in the West and North Central region were below this level in 1953, compared to about 18 percent in the Northeast. By 1974, the proportion of southern families below $5,000 had been reduced to 18 percent. The comparable proportions in the non-South regions in 1974 were lower than the South but similar to one another: 10 percent in the North Central region, 11 percent in the Northeast, and 12 percent in the West. Thus, although the South still lags behind the non-South regions, a substantial number of southern families managed to move out of the lower portion of the income distribution.

In 1953, differences in the proportion of South and non-South families in the upper portion of the income distribution were not as great as differences in the lower portion. For instance, 88 percent of families in the non-South had incomes below $15,000 in 1953 compared to about 94 percent of southern families. By 1974, about 56 percent of families in the Northeast and North Central regions had incomes below $15,000 compared to 58 percent in the West and about 68 percent in the South.

RELATED REPORTS

Current Population Survey. Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 100. A cross reference of tables contained in this report with comparable tables included in other reports in the P-60 Series can be obtained by writing to Meyer Zitter, Chief, Population Division, Bureau of the Census, Washington, D.C. 20233. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the **Special Labor Force Reports** of the Bureau of Labor Statistics. Series P-23, No. 39 "Differences Between Incomes of White and Negro Families by Work Experience of Wife and Region: 1970, 1969, and 1959" contains data comparable to tables 73 to 76 and 79 included in this report. Series P-60, No. 99, "Money Income and Poverty Status of Families and Persons in the United States: 1974" contains advance 1974 income data cross-classified by various characteristics. Series P-60, No. 100, "Household Money Income in 1974 and Selected Social and Economic Characteristics of Households" contains 1974 income data on households. For a detailed analysis of the low income population in 1973, in the United States, see Series P-60, No. 98. Series P-60, No. 99 contains advance data on the low income population in 1974.

Projections of money income size distributions have been prepared from the Current Population Survey and appear in Series P-23, No. 47, "Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals." Projections have been prepared for families and unrelated individuals by age of the family head or of the individual in 1971 constant dollars for the following years: 1975, 1980, 1985, and 1990.

Data on the educational attainment and income of men have been assembled from information collected in the Current Population Survey. These data appear in Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years, 1956 to 1972". Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, **Trends in the Income of Families and Persons in the United States: 1947 to 1964**, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Decennial censuses. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in **1970 Census of Population**, Vol. I, **Characteristics of the Population**, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in **1970 Census of Population**, Vol. I, **Characteristics of the Population**, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, **Sources and Structures of Family Income**; 8B, **Earnings by Occupation and Education**; and 8C, **Income of the Farm-**

Related Population. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the 1970 Census of Housing. Reports of the 1960, 1950, and 1940 Censuses also contain various statistics on income.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the black population and the population of Spanish origin.

Statistics on income in 1969 collected in the Current Population Survey (CPS) of March 1970 differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances. In the first place, the CPS data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self enumerated in the 1970 Census. Moreover, income data in the CPS are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within four of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median family income reported in the 1970 census was about $9,590, 1.7 percent above the comparable figure of $9,433 derived from the March 1970 Current Population Survey. This difference is smaller than the difference of 4.5 percent between the medians compiled from the 1960 census and the March 1960 Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, published in the American Statistical Association **Proceedings of the Social Statistics Section**, 1972.

NOTE: DATA FOR 1959 THROUGH 1974 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1947 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 162 OF THE APPENDIX.

Table 23. INCOME AT SELECTED POSITIONS AND PERCENTAGE SHARE OF AGGREGATE INCOME IN 1953 TO 1974, RECEIVED BY EACH FIFTH AND TOP 5 PERCENT OF FAMILIES, BY REGIONS

(In current dollars)

REGION AND YEAR	INCOME AT SELECTED POSITIONS					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLLARS)
	UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT	
	LOWEST	SECOND	MIDDLE	FOURTH

APPENDIX

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 1,064,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestocks, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm. However, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

For detailed information on the effect of the above definitional change, see Series P-60, No. 35, pages 10 and 11.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

The figures shown in this report for standard metropolitan statistical areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's defined on the basis of the 1960 census. The median income in 1969 of families residing in metropolitan areas based on the 1970 definitions and procedures is 0.5 percent lower than that based on the 1960 definitions and procedures. This difference arises partly as a result of the inclusion of new and smaller SMSA's with lower income relative to previously defined SMSA's. The median incomes of men and women were 0.3 percent and 1.5 percent lower, respectively, based on the 1970 census definitions relative to those based on the 1960 census definitions.

Central cities. The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following critera:

   a. The additional city or cities have at least 250,000 inhabitants.

   b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Mississippi, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Arizona, Colorado, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Alaska, and Hawaii.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 may be coded as $15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Public assistance or welfare payments include public assistance payments such as aid to families with dependent children, general assistance, and Supplemental Security income.

Unemployment compensation, government employee pensions, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings—the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment; and

Income other than earnings—the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under $1,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment, income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The median incomes as shown in this report are calculated from the corresponding income size distributions by linear interpolation within the income interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median. Thus, the median family incomes greater than $10,000 as shown in tables 26 and 74 differ from corresponding medians shown in tables 24 and 27, respectively, because of interpolation differences. For example, median family income for all families as shown in table 26 is $12,767 or 0.5 percent lower than the comparable median of $12,836 as shown in table 24. The median for white families as shown in table 74 is $13,271, 0.6 percent lower than the comparable median of $13,356 as shown in table 24.

In general, the median income values are calculated based on the intervals in the table which contains the medians, with the exception of certain tables. The medians for 1974 shown in tables 9 through 23 are based on the intervals shown in table 24, while the medians presented in tables 65, 68, and 69 are based on the intervals shown in table 52. The medians shown in table 74 are based on the intervals shown in table 26.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, hospitals, homes for nurses, convents, monasteries, and ships.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals. The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual. A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Married couple. A "married couple" is a husband and his wife enumerated as members of the same household or group quarters. In table 54 the category "married couples 62 years old and over" includes all couples of which either member is 62 years old and over. In the P-20 reports on Household and Family Characteristics married couples are classified by the age of the husband only.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren

and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation, class of worker, and employment status in tables 41, 59, 68, 69, 76, and 79, refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, class of worker, and industry in tables 40, 45 to 47, and 64 to 67 refer to the job held longest during the income year.

In several tables two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession, or trade, for profit or fees. Included in the self-employed groups in these tables are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings included in the income reports beginning with 1971 were based on the classification systems used in the 1970 Census of Population. These groupings, with minor differences in the group titles, were also used in the 1970 income report containing data compiled from the March 1971 survey. Between the 1970 and 1969 income reports which included data obtained from the March 1971 and March 1970 surveys, respectively, there were changes in the industry and occupation classification systems. The income reports from 1961 through 1969 utilized the 1960 census classification systems. However, beginning with the 1970 income reports, the 1970 census systems were used. For major groupings, especially for the industrial groupings, there is relatively little difference in comparability between the systems used in the 1960 and 1970 Censuses of Population. A detailed comparison of these two systems can be found in the Bureau of the Census Technical Paper 26, **1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements.** Additional information may be obtained from a paper, "Changes Between the 1960 and 1970 Census of Population" by Stanley Greene and John Priebe presented at the August 1972 American Statistical Association meeting held in Montreal, Canada. Also see "Revisions in Occupational Classifications for 1971" by John E. Bregger in **Employment and Earnings,** Volume 17, No. 8, page 5, published by the Bureau of Labor Statistics, United States Department of Labor.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "crafts").

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. An estimate of the size of the base (number of units) of each percent distribution by income in 1974 is shown in most of the tables in this report. The base figures shown in this report for 1971 to 1974 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census. A more detailed description of this change can be found in an article entitled "Revisions in Current Population Survey" **Employment and Earnings,** Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

Computation of aggregate income by fifths. In calculating aggregate income by fifths (or for the top 5 percent), from 1958 to the present, the following procedure was followed:

1. Rank the number of units (families or unrelated individuals as applicable) by size of total money income.

2. Determine the income cutoffs for each fifth (and top 5 percent) by summing the units in order from the unit with the lowest income to the unit with the highest income up to and including the unit which just causes the sum of units to equal the number of units below the relevant percentile; and selecting as the upper income cutoff for this percentile the unit which causes the sum of units to equal the number of units below the relevant percentile.

3. Determining the aggregate income in a particular fifth by summing the aggregate incomes of all units corresponding to those units included below the percentile cutoff as determined in step 2 and subtracting the aggregate income for the units in the next lower percentile. The aggregate income for the top 5 percent was determined by subtracting the aggregate income of all units below the ninety-fifth percentile from the total aggregate income for all units.

4. And, finally, calculate the percent distribution of aggregate income.

In calculating the aggregate income by fifths and the top 5 percent for 1958 and all previous years (data for 1958 were calculated both ways), the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For income intervals below $15,000, the midpoint of each class interval was used. (Note: Before calculating the aggregate income distributions, all income intervals below $15,000 which were greater than $1,000 in width were split into $1,000 intervals by interpolation assuming that incomes within the wider interval were distributed according to a Pareto distribution. The midpoints were then calculated based on these smaller income intervals.) A value of $19,000 was used for the $15,000 to $24,999 interval. For the $25,000 and over interval, the estimate of the mean was calculated based on a Pareto Curve fitted to the number of units in the $15,000 to $24,999 interval.

The upper income level of a particular fifth of units ranked by income was estimated by cumulating the number of units in successive income intervals and by interpolating linearly within the income interval in which the fifth falls (designated the reference interval). After determining the upper income level for this fifth, the aggregate income below this income level was estimated by multiplying the midpoint for the interval between the upper income level of the fifth and the lower income level of the reference interval for this fifth by the number of units within this segment and adding the result obtained to the total aggregate income below the reference interval. The aggregate income for a particular fifth was determined as a residual by subtracting the aggregate income below the next lower fifth from the aggregate income below the particular fifth.

For a more detailed description of the method of computing aggregate income by fifths, for 1947 through 1958, see Technical Paper No. 8, **Trends in the Income of Families and Persons in the United States:** 1947 to 1960, pages 16 to 26, or its revision, Technical Paper No. 17, **Trends in the Income of Families and Persons in the United States: 1947 to 1964.**

The following assumptions were used in the above procedures for 1947 through 1958:

1. In subdividing the income intervals below $15,000, the interpolation was made using a Pareto estimation technique.

2. In estimating the mean income per income interval, midpoints and the Pareto estimation techniques were used.

3. In finding the upper levels of each fifth, a linear interpolation technique was used, and

4. In obtaining the mean income of the subinterval between the upper level of the fifth and the lower level of the reference interval, midpoints were used as a proxy for mean income.

Computation of constant dollar distributions. The adjustment for price change was made by converting the income distribution for families and unrelated individuals for each year (1947 to 1973) into 1974 dollars on the basis of the change in the Consumer Price Index. In choosing a procedure to make this conversion, two fundamental assumptions concerning income data were made: (1) Price changes have the same proportional effect on various income levels and (2) the distribution within each income interval follows a Pareto distribution. The following procedure satisfies these two assumptions.

The first step required the accumulation of the income distribution starting with the highest income interval and cumulating to the lowest income interval. Next, the limits of each income interval were converted into 1974 dollars by adjusting them by a factor representing the change on the basis of that year's price index (1974 = 100). Finally, the number of families and unrelated individuals in each of the detailed class intervals were computed by logarithmic interpolation and then combined into broad income intervals.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices have not been developed for families in different income class intervals. Neither did the available data permit adjustment for the fact

that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data cover also family savings and income tax payments. For these and other reasons, the constant-dollar figures, particularly in the income range over $10,000, are to be regarded as approximations.

The constant-dollar distributions in table 12 were obtained by applying the same procedures as used for the Country as a whole to the current-dollar family income for each region. Previous studies indicated that regional price indices differed only slightly from the U.S. Index. The limitations noted earlier for the United States distributions in terms of constant dollars apply also to the regional distributions. It should also be noted that the adjustments for price change have been introduced in order to measure changes in real incomes within a region over time, and that they have limited use for the purpose of interregional comparisons. The available consumer price indices measure the relative change in price levels in each region and make possible a comparison of the relative changes of constant-dollar income between regions. These indices do not, however, reflect geographical differentials in price levels. Therefore, caution should be used when comparing the absolute levels of constant-dollar income between regions.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. **Income definition.** The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. **Source of data.** The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 98 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. **Population coverage.** The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. **Average income.** The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable

to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, **Major Statistical Series of the U.S. Department of Agriculture,** Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $2,050 (less than $2,800 if 65 years old or over) and married couples receiving less than $2,880 ($3,550 if one spouse is 65 years old or over; $4,300 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of $13,200 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

COMPARABILITY OF ESTIMATES FROM MARCH 1975 CPS WITH ESTIMATES FOR PREVIOUS YEARS

The data for 1974, 1973, 1972, and 1971 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providng some measure of the impact of the changes (see table 3, **Current Population Reports, Series P-60, No. 91**). Basically, these changes should have no

substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, **Employment and Earnings**, Vol. 18, No. 8, February 1972.

The figures shown in this report for metropolitan areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's as defined on the basis of the 1960 census. There are significant differences in the population classified as metropolitan from each of these definitions. For the 1970 definition of SMSA's, see U.S. Census of Population: 1970, **Number of Inhabitants**, PC(1)-A1, United States Summary.

Another change in the Current Population Survey, which affects occupational data only, is the inclusion of a supplemental question, "What were your most important activities or duties?," which provided additional information for classifying persons by occupation. In general, the impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "craft and kindred workers").

Cross-Classification Of Income and Work Experience Data. This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey, in order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces included in the March survey are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, **Special Labor Force Reports**, "Work Experience of the Population". The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the **Special Labor Force Reports** relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but, also, many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

NONRESPONSES AND ALLOCATIONS

In the March 1975 CPS, no information was recorded for approximately 5 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 22 percent of all families and 16 percent of unrelated individuals 14 years old and over. Overall, about 16 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, **Proceedings of the Social Statistics Section**, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this

person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958 a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See **Current Population Reports**, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, **Proceedings of the Social Statistics Section**, 1969.

Starting from the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) An expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, **Proceedings of the Social Statistics Section**, 1969. See also "Current Developments in Collecting Income Data in the Current Population Survey," by Mitsuo Ono, published in the American Statistical Association, **Proceedings of the Social Statistics Section**, 1971.

QUESTIONNAIRE AND PROCEDURAL CHANGES

Modifications in collecting income data in the March-April 1969 CPS. Several modifications were introduced in the collection of income data in the March and April CPS supplements. These include (1) extension of the interview period of the six rotation groups for which income questions were asked in March and the use of followup forms in these six groups to accommodate household respondents who needed more time to obtain the required income information (it is estimated that some members of approximately 4,400 households, or 9 percent of the total relevant households, made use of these followup forms); (2) modification of the design and content of the questionnaire to allow for more detailed questioning of certain income items; thus, boxes for gross receipts, business expense, and net income have been added to the self-employment income questions to help the interviewer and respondent determine net income, and "yes-no" circles were added to the questions on income other than earnings in order to ascertain whether the respondent received or did not receive income; (3) field office editing procedures were extended to a 100 percent income edit of the CPS schedules; (4) training instructions were strengthened by including more detailed explanations and more examples; and (5) the interview group training session was shifted from February to March.

Modifications in collecting income data in the March 1970 Current Population Survey. The Bureau introduced modifications in the collection of income data for the March 1970 CPS supplement. These were: (1) An advance letter informing households about the collection of income data was mailed to all households except those in the first and fifth months. The latter households received special letters which explained the need for collecting both CPS and census data; (2) information on work experience and income was collected simultaneously for the full sample (in previous years, work experience information was collected separately from income data); (3) the interview period was extended one week for three-fourths of the sample (using followup calls and separate questionnaires). In addition, modified procedures which were incorporated in the March 1969 CPS supplement were also implemented in the March 1970 CPS. Overall, data indicate that the use of these procedures has resulted in some improvement in the collection of income data. The family income nonresponse rate has not only dropped by 5 percentage points (from 19 to 14 percent) but also it appears that the proportion of aggregate income amounts collected in the March 1970 CPS relative to benchmark totals has

increased slightly in the March 1970 CPS supplement as compared with the proportion collected in the March 1969 CPS supplement.

Modifications in collecting income data in the March 1971 Current Population Survey. The Bureau continued to use the improved procedures which were incorporated in the March 1970 CPS. Procedural changes that were instituted in the March 1971 CPS, among others, were:

1. The interview period was extended one week for all households in the sample (using follow-up calls and separate questionnaires). In the previous year's survey, the interview period was extended for only three-fourths of the sample.

2. Income from net royalties was included in the question covering estates, trusts, or dividends, interest on savings accounts or bonds, and net rental income. In previous surveys, income from net royalties was included in the question covering private pensions, annuities, alimony, regular contributions from persons not living in this household, and anything else.

3. An additional regional office follow-up was made by telephone to obtain income amounts for all follow-up cases containing one or more persons who were not interviewed during the original follow-up period, except for refusal.

Modifications in collecting income data in the March 1975 Current Population Survey. Several modifications in the design and content of the questionnaire were introduced in the March 1975 CPS to allow for more detailed questioning of certain income items. These changes were:

1. In the March 1974 CPS, income from aid to families with dependent children, old age assistance, and aid to the blind or totally disabled were asked in one combined question on welfare payments. Beginning in January 1974, the programs for old age assistance and aid to the blind or totally disabled were replaced by the Supplemental Security program. Therefore, in the March 1975 CPS a separate question was asked for the receipt of Supplemental Security income. Income from aid to families with dependent children or any other assistance was asked under the general category of public assistance or welfare payments.

2. In the March 1974 CPS, income from interest, net rental income or income from estates, trusts, or dividends was asked in one question. In the 1975 CPS these income types were asked as two questions with income received from interest on savings accounts or bonds included in one question and income from estates, trusts, or dividends in the other.

3. In the March 1974 CPS, income received from private pensions was asked along with alimony and certain other income items while income from government employee pensions was asked along with veterans' payments, unemployment compensation and workmen's compensation. In the March 1975 CPS, income received from both private and government employee pensions (including military retirement) were extracted from their previous categories and asked as one combined question.

In order to expedite processing of the March 1975 CPS data, it was decided to tabulate the income data according to the same income groupings used from the March 1974 CPS data. The new information on Supplemental Security income was tabulated along with public assistance since it replaced old age assistance and aid to the blind or totally disabled. It is planned to incorporate the detailed income categories into the published income tabulations for the March 1976 CPS.

OTHER LIMITATIONS OF THE DATA

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contributions from nonhousehold members; (2) reluctance to reveal certain types of income types, e.g., public assistance; (3) rounding estimates; (4) misunderstanding the question; (5) lack of information, especially covering family members not present at the time of interview; (6) interviewers' errors and; (7) processing errors, etc.

For more details on this topic of income underreporting in censuses and surveys, see: (1) **Income Distribution in the United States** (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966; (2) **The Structure of Income,** by Irving B. Kravis, Unversity of Pennsylvania, 1962 and; (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

In previous consumer income reports, for example P-60, No. 97, table A-8, data were presented comparing CPS aggregate money income for various types with comparable estimates of aggregate money income derived from independent sources. A similar table is not shown in this report, since benchmark revisions are currently being made to the independent data sources employed in the analysis. However, it is planned to include such a table in future consumer income reports as the revised data become available.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained annually for 1947 through 1974 in the Current Population Survey of the Bureau of the Census. Every March since 1948, data have been collected on money income for the previous calendar year. Brief Descriptions of the sources and the procedures by which the data were obtained are presented below.

The estimating procedure involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that the husband and wife of a household received the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures.

Nonsampling variability. As in any survey work, the results are subject to errors of response including underreporting and nonreporting in addition to sampling variability. In most cases, the information obtained for money income is based not on records kept but on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys may produce biases. For example, interest received from small or numerous savings accounts is sometimes overlooked. This is particularly true when the question is asked about a time several months past as opposed to one month ago. A discussion of other nonsampling error titled "Nonresponses and Allocations" appears earlier in this appendix.

Sampling variability. The reliability of an estimate is described in terms of standard errors, which are primarily measures of sampling variability; that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of certain response and enumeration errors, but it does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less

than 1.6 times the standard error and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables A-1 through A-6 are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

To calculate standard errors for persons, families, and unrelated individuals in the United States it was necessary to use two parameters (denoted as "a" and "b") which are presented in table A-7. The use of the parameters will be explained in later sections. Finally, illustrated confidence intervals of median income for selected characteristics of families and persons are shown in table A-8.

Standard errors of estimated numbers. Tables A-1 and A-2 show the standard errors of the estimated numbers of total or white families and total or white

Table A-1. Standard Errors of Estimated Numbers of Families and Unrelated Individuals: 1966 to 1974

Total or White

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	10,000....	99
250.....	16	25,000....	147
500.....	23	50,000....	182
1,000.....	32	60,000....	187
2,500.....	51	80,000....	184
5,000.....	72		

Table A-2. Standard Errors of Estimated Numbers of Persons: 1966 to 1974

Total or White

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	10,000....	121
250.....	20	25,000....	184
500.....	28	50,000....	241
1,000.....	39	100,000...	282
2,500.....	62	160,000...	236
5,000.....	87		

When the numerator and denominator of the percentage are in different categories, use the table indicated by the numerator. Linear interpolation in these tables may be used to obtain standard errors for intermediate values of x and p, or the following formula (F.2), from which the tabulated standard errors are computed, can be used directly; direct computation will give more accurate results than linear interpolation.

$$\sigma_{x,p} = \sqrt{\frac{b}{x} \cdot p(100-p)} \qquad \text{(F.2)}$$

Here x is the size of the subclass of the population which is the base of the percentage, p is the percentage ($o \leq p \leq 100$), and b is the parameter in table A-7 associated with the particular type of characteristic in the numerator of the percentage.

Table A-3. Standard Errors of Estimated Numbers of Families and Unrelated Individuals: 1966 to 1974

Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	2,500.....	44
250.....	15	5,000.....	55
500.....	21	6,000.....	57
1,000.....	29		

Table A-4. Standard Errors of Estimated Numbers of Persons: 1966 to 1974

Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	2,500.....	56
250.....	19	5,000.....	75
500.....	26	10,000....	93
1,000.....	37	15,000....	95

Note: To estimate standard errors for 1947 to 1954 multiply the standard errors in tables A-3 and A-4 by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2.

Illustration of use of standard error tables. Table 37 of this report shows that in 1974 there are 5,278,000 families with three earners. Table A-1 shows the standard error on an estimate of this size to be approximately 74,000.[1] The chances are 68 out of 100 that the estimate would have differed from a complete census figure by less than 74,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than twice the standard error.

Of these 5,278,000 families with three earners, 364,000 or 6.9 percent had an income of $10,000 to $11,999. Interpolation in table A-5 shows that the standard error of 6.9 percent on a base of 5,278,000 to be approximately 0.3[2] percent. The chances are 68 out of 100 that an estimate would have differed from a complete census figure by less than 0.3 percent, and the chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 0.6 percent, i.e., this 95 percent confidence interval would be from 6.3 to 7.5 percent.

Standard errors of differences. The standard error of differences in estimated numbers and in percents with illustrations of computation follow.

Differences between estimated numbers. The formula for approximate standard error of the difference between two estimated numbers is given by: (F.3):

$$\sigma_{\Delta} = \sqrt{\sigma_1^2 + \sigma_2^2 - 2\rho\sigma_1\sigma_2} \qquad \text{(F.3)}$$

where σ_1 and σ_2 are the standard errors presented in tables A-1 through A-4. The correlation coefficient ρ is assumed to equal zero for this report. Making this assumption will result in accurate estimates of standard errors for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a positive correlation between the two characteristics, the formula will overstate the true standard error.

Linear interpolation can be used for intermediate values not shown in the standard error tables or an alternative computation procedure can be used.

[1] Formula (F.1) gives a standard error of 73,400.
[2] Formula (F.2) gives a standard error of 0.36 percent.

The alternative method of computing differences between estimated numbers requires using the following formulas (F.4) for computing σ_1 and σ_2 used in formula (F.3):

$$\sigma_1 = \sqrt{a_1 x_1^2 + b_1 x_1}$$

and (F.4)

$$\sigma_2 = \sqrt{a_2 x_2^2 + b_2 x_2}.$$

Here x_1 and x_2 are the size of the estimates; a_1, b_1, a_2, and b_2 are the parameters for the characteristics and population in question.

Illustration of the computation of the standard error of a difference in estimated numbers. Table 37 of this report shows that there are 2,701,000 families with 4 or more earners. Thus, the apparent difference between the number of families with 3 earners and those with 4 or more earners is 2,577,000. The standard error of 5,278,000 families with 3 earners for 1974 is 74,000 as shown above. Table A-1 shows the standard error on an estimate of 2,701,000 to be approximately 53,000. The standard error of the estimated difference of 2,577,000 by (F.3) is about

$$91{,}000 = \sqrt{(74{,}000)^2 + (53{,}000)^2}.$$

This means the chances are 68 out of 100 that the estimated difference based on the sample would differ from the difference derived using complete census figures by less than 91,000. The 68 percent confidence interval around the 2,577,000 difference is from 2,486,000 to 2,668,000, i.e., 2,577,000 ± 91,000. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 2,395,000 to 2,759,000 and thus we can conclude with 95 percent confidence that the number of families with three earners is greater than the number with four or more earners.

Differences between percents. The formula for an approximate standard error of the difference between two percents is the same as (F.3) above, but σ_1 and σ_2 are standard errors presented in tables A-5 and A-6. The assumptions are the same as those presented above for estimated numbers.

Linear interpolation can be used for intermediate values not shown in the standard error tables or an alternative computation procedure can be used.

The alternative method of computing differences between percents requires using the following formulas (F.5) for computing σ_1 and σ_2 used in formula (F.3):

$$\sigma_1 = \sqrt{\frac{b_1}{x_1} \cdot p_1 \cdot (100 - p_1)}$$

and (F.5)

$$\sigma_2 = \sqrt{\frac{b_2}{x_2} \cdot p_2 \cdot (100 - p_2)}.$$

Here, x_1 and x_2 are the bases of the percents; b_1 and b_2 are the parameters for the characteristics and population in question; and p_1 and p_2 are the percents being compared ($0 \leq p_1, p_2 \leq 100$).

Table A-5. Standard Errors of Estimated Percentages of Families and Unrelated Individuals: 1966 to 1974

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100	1.4	2.2	3.1	4.5	5.2
250	0.9	1.4	2.0	2.8	3.3
500	0.6	1.0	1.4	2.0	2.3
1,000	0.5	0.7	1.0	1.4	1.6
2,500	0.3	0.4	0.6	0.9	1.0
5,000	0.2	0.3	0.4	0.6	0.7
10,000	0.14	0.2	0.3	0.4	0.5
25,000	0.09	0.14	0.2	0.3	0.3
50,000	0.06	0.10	0.14	0.2	0.2
60,000	0.06	0.09	0.13	0.18	0.2
80,000	0.05	0.08	0.11	0.16	0.18

Note: To estimate standard errors for 1947 to 1954 multiply the above standard errors by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2. For Negro and other races, multiply the standard errors by 0.93 in addition to the factors for years other than 1966 to 1974.

Illustration of the computation of the standard error of a difference of percents. Table 37 of the report shows that in 1974 an estimated 11.4 percent of the 21,968,000 families with 2 earners had an income of $10,000 to $11,999. An estimated 6.9 percent of the 5,278,000 families with 3 earners had an income in this range. By formula (F.5) the standard error of 11.4 percent is 0.22 percent and the standard error of 6.9 percent is 0.36 percent. The standard error of the estimated difference of 4.5 percent using formula (F.3) is about 0.4 percent, i.e.,

$$0.4 = \sqrt{(.22)^2 + (.36)^2}.$$

The 95 percent confidence interval around the 4.5 percent difference is from 3.7 to 5.3 percent. Hence, we can conclude with 95 percent confidence that the proportion of families with 2 earners with an income in 1974 of $10,000 to $11,999 is actually greater than the corresponding proportion of 3-earner families.

Ratios. A ratio of two numbers can be expressed as a mean for the purposes of computing an approximate standard error. In the case where either the numerator or denominator of the ratio is income, the formula for the standard error of the mean (F.6) should be used. In the case where the ratio has persons in the numerator and families in the denominator, formula (F.7) with the appropriate ρ will give a preferable result to that of formula (F.6).

Standard error of the arithmetic mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}} = \sqrt{\frac{b}{n}\left[\sum_{i=1}^{c} P_i \, x_i^{\,2} - \bar{x}^{\,2}\right]} \qquad \text{(F.6)}$$

where n is the weighted total number of cases in all c income classes.

P_i is the proportion of total cases in the i^{th} income class.

x_i is the mean income of the i^{th} class. Use the values in tables 1 or 3.[3]

$\bar{x}$ is the mean income of the distribution. $\sum_{i=1}^{c} P_i \, x_i$.

b is the parameter "b" from table A-7 corresponding to the characteristic of interest.

[3] If the open-end interval is $10,000 and over, use $19,000
$15,000 and over, use $24,000
$25,000 and over, use $35,000
$50,000 and over, use $65,000.

Table A-6. Standard Errors of Estimated Percentages of Persons: 1966 to 1974

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100	1.7	2.7	3.7	5.4	6.2
250	1.1	1.7	2.3	3.4	3.9
500	0.8	1.2	1.7	2.4	2.8
1,000	0.5	0.9	1.2	1.7	2.0
2,500	0.3	0.5	0.7	1.1	1.2
5,000	0.2	0.4	0.5	0.8	0.9
10,000	0.2	0.3	0.4	0.5	0.6
25,000	0.11	0.17	0.2	0.3	0.4
50,000	0.08	0.12	0.17	0.2	0.3
100,000	0.05	0.09	0.12	0.17	0.2
160,000	0.04	0.07	0.09	0.13	0.15

Note: To estimate standard errors for 1947 to 1954 multiply the above standard errors by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2. For Negro and other races, multiply the standard errors by 0.95 in addition to the factors for years other than 1966 to 1974.

Table A-7. Parameters of Estimated Numbers and Percentages of Persons, Families and Unrelated Individuals: 1966 to 1974

Characteristic	a	b
PERSONS		
Total.....	-.0000074	1533.4986
14 to 64 years.....	-.0000110	1533.4986
65 years and over.....	-.0000740	1533.4986
White.....	-.0000085	1533.4986
14 to 64 years.....	-.0000129	1533.4986
65 years and over.....	-.0000818	1533.4986
Negro and other races.....	-.0000520	1384.8466
14 to 64 years.....	-.0000840	1384.8466
65 years and over.....	-.0007500	1384.8466
FAMILIES AND UNRELATED INDIVIDUALS		
Total or white.....	-.0000080	1063.1809
Negro and other races.	-.0000640	922.0689

Note: For years prior to 1966, a standard error estimate computed with these parameters must be adjusted. For 1947 to 1954, multiply the standard error by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2.

Standard error of a ratio. Certain mean values, for persons in families, listed in the tables of this report were not calculated using the formula for $\bar{x}$ given above. Rather, they were calculated as the ratio of two numbers. For example, the mean number of children per family with children is calculated as

$$\frac{x}{y} = \frac{\text{total number of children in families}}{\text{total number of families with children}}$$

Standard errors for these means may be approximated as shown above from the standard error tables or by using formula (F.1) and the parameters from table A-7. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class; as for example, the mean number of children per family with children. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]} \quad \text{(F.7)}$$

The standard error of the estimated number of families, σ_y, may be obtained from table A-1, and the standard error of the estimated number of persons with the characteristic, σ_x, may be obtained from table A-2. Alternatively, formula (F.1) and table A-7 may be used. In formula (F.7), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ρ.

This procedure can also be used to compute the standard error on the estimate of mean family size where

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

and ρ is again estimated to be approximately 0.7.

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more; for example, the mean number of children per family. For ratios of this kind the standard error is approximated by formula (F.7) but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Sampling variability of a median. The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends on the distribution as well as on the size of the base.

Confidence limits of a median based on sample data may be estimated as follows: (1) from tables A-5, A-6, or formula (F.2) using the appropriate base, determine the standard error of a 50 percent characteristic, (2) add to and subtract from 50 percent the standard error

Table A-8. Confidence Intervals (68 and 95 percent) for Selected Medians

Characteristics of families and persons	Base (thousands)	Median income	Confidence interval	
			68 percent	95 percent
FAMILIES				
From table 24				
Race:				
White	49,451	$13,356	$13,309-$13,403	$13,262-$13,450
Negro	5,498	7,808	7,694-7,922	7,581-8,035
Residence:				
Farm	2,398	10,431	10,207-10,655	9,983-10,879

From table 59				
Male professional, technical, and kindred workers, total	7,564	14,019	13,886-14,152	13,754-14,284
Salaried	6,791	13,838	13,706-13,970	13,575-14,101

[1]Limited to families with head 25 years old and over.
[2]Limited to persons 25 years old and over.

determined in step (1), and (3) using the distribution of the characteristic, read off the confidence interval corresponding to the two points established in step (2). A two-standard error confidence limit may be determined by finding the values corresponding to 50 percent plus or minus twice the standard error from tables A-5, A-6, or formula (F.2).

Illustration of the computation of a confidence interval of a median. The median income of families with five children was $12,453 in 1974 (table 27). There was an estimated 982,000 families of this type.

1. From table A-5, the standard error of 50 percent of these families, expressed as a percentage, is about 1.6 percent.

2. Since the usual interest is in the confidence interval for a median at the two-standard-error level, add and subtract twice the standard error obtained in step (1). This yields percentage limits of about 46.8 and 53.2.

3. Since 38.7 percent of these families had incomes below $10,000 and 9.1 percent had incomes between $10,000 and $11,999, the dollar value of the lower limit may be found by linear interpolation to be:

$$\left(\frac{46.8 - 38.7}{9.1}\right) \times \$2{,}000 + \$10{,}000 = \$11{,}780.$$

Since 47.8 percent of these families had incomes below $12,000 and 14.7 percent had incomes between $12,000 and $14,999 the dollar value of the upper limit is found to be:

$$\left(\frac{53.2 - 47.8}{14.7}\right) \times \$3{,}000 + \$12{,}000 = \$13{,}102.$$

The 95 percent confidence interval is $11,780 to $13,102.

Table A-8 contains 68 percent and 95 percent confidence intervals for various medians of differing magnitudes and bases. A 68 percent confidence interval is defined such that if many samples are taken and a one-standard-error confidence interval is formed for each sample median, about 68 out of 100 of these intervals will contain the median which would be found if a complete census were taken. For a two-standard-error confidence interval, about 95 out of 100 of the intervals formed would contain the census median.

CURRENT POPULATION REPORTS-CONSUMER INCOME

(List excludes advance reports)

Series P-60
