# Household Money Income In 1976 and Selected Social and Economic Characteristics of Households

## NOTE

The income estimates compiled from the March 1977 Current Population Survey (CPS) were obtained from an expanded sample of households. This sample consisted of 65,500 housing units, approximately 10,500 more housing units than were used to develop income estimates from the March 1976 CPS. Further discussion of the sample expansion and other modifications to the income data can be found in the section, "New Procedures Used in the March 1977 CPS."

## MONEY INCOME IN 1976

The median money income of households in the United States rose to \$12,690 in 1976, an increase of about 8 percent over the 1975 median of \$11,800. Although most of this increase was eroded by rising prices, the net gain in real purchasing power was still statistically significant. After adjusting for the 6 percent rise in prices between 1975 and 1976<sup>1</sup>, the 1976 median in terms of constant dollars increased by about 2 percent over the 1975 median.

The increase in real median household income between 1975 and 1976 reflected the recovery of the economy from the recent recession and the abatement of high-level inflation. The improved position of the economy was indicated by a 6 percent increase in the real Gross National Product

between 1975 and 1976<sup>2</sup>. During the same period, the average annual unemployment rate for the Nation decreased from 8.5 percent in 1975 to 7.7 percent in 1976<sup>3</sup>.

The increase of 2 percent in real median household income between 1975 and 1976 marks a reversal from the downward trend that had prevailed since 1973. Real median household income decreased by 5 percent between 1973 and 1974 and 3 percent between 1974 and 1975. However, the 1976 median household income of \$12,690 was still lower, in terms of 1976 constant dollars, than the peak of \$13,470 in 1973.

Aggregate household money income increased by 10 percent between 1975 and 1976 as a result of a 2-percent increase in the number of households (1.3 million additional households) and an 8-percent increase in the average (mean)

<sup>1</sup> The percentage increase in prices between 1975 and 1976 is computed by dividing the annual average Consumer Price Index (CPI) for 1976 by the annual average value of the CPI for 1975.

**Table A. Number of Households and Summary Measures of Household Income in 1975 and 1976**

(Households as of March of the following year. For meaning of symbols, see text)

Year	Number of households (thousands)	Aggregate income (billions)	Summary measures		
			Median income	Mean income	Per capita income
1975.....	72,867	\$1,004.0	\$11,800	\$13,779	\$4,767
1976.....	74,142	1,106.3	12,686	14,922	5,220
Percent change.....	*1.7	*10.2	*7.5	*8.3	*9.5
CONSTANT (1976) DOLLARS					
1975.....	...	\$1,061.9	\$12,481	\$14,574	\$5,042
1976.....	...	1,106.3	12,686	14,922	5,220
Percent change.....	...	*4.2	*1.6	*2.4	*3.5

Note: An asterisk (\*) preceding percent change indicates statistically significant change at the 95-percent confidence level.

household money income. After adjusting for inflation, the 1976 aggregate household income represented an increase of 4 percent over the 1975 figure.

Of the 74.1 million households in the United States in March 1977, 10.8 million (14.6 percent) had incomes of \$25,000 or more in 1976; these households received 35.2 percent of aggregate income in 1976. Another 20.1 million households (27.1 percent) had incomes between \$15,000 and \$25,000 and received 35.0 percent of aggregate income. At the other end of the scale, 13.2 million households (17.9 percent) had incomes under \$5,000 and received 3.5 percent of the aggregate income.

In March 1977, about 64 percent of all households were husband-wife households; approximately 11 percent were

headed by a male with no wife present and the remaining 25 percent were headed by a female with no husband present. Husband-wife households and those headed by a male with no wife present had a median income of \$15,300 in 1976, which represented a constant dollar increase of 3 percent above their 1975 median. The 1976 median income of households headed by a female with no husband present was \$5,760 in 1976, not significantly different from their 1975 median. However, sampling variability was too large to reliably determine whether the percentage change in real median income for the former group was significantly different from that of the latter group.

White households had a median income of \$13,290 in 1976, which represented a constant dollar increase of 2 percent above their 1975 median. The median income of Black

**Table B. Number of Households, Mean Income, and Aggregate Household Income in 1976**

(Households as of March 1977)

Total money income	Households		Mean household income (dollars)	Aggregate household income

households (\$7,900 in 1976) showed no statistically significant change in real terms. However, sampling variability was too large to reliably determine whether there was an actual difference between the percentage changes in median income for Black and White households.

Annual changes in real per capita income since 1973 have been slightly different than changes in real median household income, primarily because of the decline in average household size from 2.97 persons in March 1974 to 2.86 persons in March 1977. Real per capita income increased by 4 percent between 1975 and 1976, but declined by 4 percent between 1973 and 1974 and 2 percent between 1974 and 1975.<sup>4</sup>

The 1976 median incomes of households in the North Central (\$13,680) and South (\$11,460) regions represented an increase in real terms of 3 percent. Median income in 1976 of households in the Northeast (\$13,070) and West (\$13,040) regions did not represent statistically significant changes in real terms<sup>5</sup>.

For households classified by type of residence, the highest median income in 1976 (\$16,420) was associated with suburban households of large metropolitan areas (population of one million or more), while the lowest median income (\$10,070) was associated with farm households located outside metropolitan areas. The median income for the 12.2 million households located in central cities of large metropolitan areas (\$10,960) was approximately 67 percent of the median income for the 16.9 million suburban households of these metropolitan areas (\$16,420). In smaller metropolitan areas (population of less than one million), the median income for the 10.5 million central city households (\$11,390) was about 79 percent of the median income for the 10.8 million suburban households (\$14,410).

Household income varied greatly according to housing tenure and residence. The median income of households in owner-occupied properties (\$15,350 in 1976) was higher by about 73 percent than the median income of households in renter-occupied properties (\$8,880 in 1976). This relationship is consistent for households both inside and outside metropolitan areas, but it is more pronounced for households within metropolitan areas. In these areas, owner-occupied households had a median income of \$16,890 in 1976, which was about 85 percent higher than the median income (\$9,120) for renter-occupied households. For households outside metropolitan areas, the median income for owner-occupied households (\$12,450) was 52 percent higher than the median income for renter-occupied households (\$8,170).

These are some of the highlights of household income statistics obtained from the Census Bureau's Current Population Survey of March 1977. The survey results cover both the civilian noninstitutional population and an estimated

<sup>4</sup> Between 1973 and 1974, the percentage decline in per capita income was significantly different from the percentage decline in median income at the 90-percent confidence level.

<sup>5</sup> Sampling variability was too large to reliably determine whether the changes in median income in the four regions were significantly different from one another.

954,000 persons who were members of the Armed Forces living off post or with their families on post in the United States. The 1977 survey shows that there were about 212,566,000 persons, of whom 211,959,000 were living in households and the remaining 607,000 were living in group quarters. There were about 74,142,000 households, comprised of 56,472,000 primary families and 17,669,000 primary individuals. (See definition of primary families and individuals in the section on "Definitions and Explanations.")

Household income is different from family income in that household income includes not only the income of all related persons in the household but also the income of any unrelated persons in the household. Household income also covers the income of one-person households. Family income is limited to the income of related persons in the household only.<sup>6</sup> Additional information on the difference between household and family income can be found in the section on "Definitions and Explanations."

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. For a further discussion of the sampling variability, see the section on "Source and Reliability of the Estimates."

The data on income collected in the CPS are limited to money income received before payments for personal income taxes and deductions for Social Security, union dues, Medicare premiums,<sup>7</sup> etc. Money income is the sum of the amounts received from earnings (including losses which occurred among the self-employed from their own farm or nonfarm operations); Social Security and public assistance payments; Supplemental Security income; dividends, interest, and rent (including losses); unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many households receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm households receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels.

As in most household surveys, the estimated total amount of income received by persons derived from the March CPS is

<sup>6</sup> Income data in 1976 for families and persons can be found in Current Population Reports, Series P-60, No. 107.

<sup>7</sup> A facsimile of the income questions asked in the survey is shown on page 88.

somewhat less than estimated amounts derived from independent sources such as the Bureau of Economic Analysis, the Social Security Administration, Veterans' Administration, etc. The difference between the survey estimate and the independent estimate is termed "underreporting." Under-reporting tends to be more pronounced for income sources that are not derived from earnings, such as Social Security, public assistance, unemployment compensation, and net income from interest, dividends, rentals. Overall, income earned from wages or salary is much better reported than other sources of income and, when dollar imputations are assigned for nonreporting, total wage and salary income approximates independently derived estimates. By contrast, 1975 income data (both reported and allocated) for Social Security payments to beneficiaries were approximately 91 percent of independently derived estimates; income from Aid to Families with Dependent Children was about 78 percent of independent estimates; and income from unemployment compensation was about 63 percent of independently derived estimates. For further details, see the section on "Underreporting of Income."

The detailed tables which follow show household income data from several perspectives. The content of data in these tables is very similar to that shown in the previous household income report, **Current Population Reports**, Series P-60, No. 104. In addition, two new tables have been added: Table 10, which contains distributions of total money income for households in the 10 standard Federal regions; and table 11, which contains distributions by total money income for households in the 20 largest standard metropolitan statistical areas, cross-classified by whether they lived inside or outside of central cities.

## NEW PROCEDURES USED IN THE MARCH 1977 CPS

The income statistics tabulated from the March 1977 CPS reflect two important modifications of procedures from those used in previous surveys. These changes involved the use of (1) an expanded sample of housing units and (2) refined interpolation procedures for calculating median incomes and their respective standard errors.

As previously indicated, the basic monthly CPS sample of approximately 55,000 housing units and other living quarters was expanded to about 65,500 units per month. The sample expansion was initiated in conjunction with the Comprehensive Employment Training Act (CETA) to obtain estimated annual averages of the number of unemployed in each State and the District of Columbia. Further discussion of the CETA supplementation to the CPS can be found in the section "Source and Reliability of the Estimates."

Although the major purpose of the expanded sample was to improve the reliability of the unemployment data, the expansion also improved the reliability of the income data, particularly for detailed geographic levels. The CETA supplement has been in existence since July 1975, but was not incorporated into the published income estimates prior to

these estimates from the March 1977 CPS. A comparison of data from the March 1976 CPS before and after expansion of the sample indicated that inclusion of the CETA supplement had only a slight impact on the income data, for both the total and poverty population. However, when making year-to-year comparisons, the reader is reminded that the 1975 income data are based on the unexpanded sample whereas the 1976 income data are based on the expanded sample. A detailed discussion of differences in the 1975 income statistics between the expanded and unexpanded samples will appear in the final reports on income and poverty for 1976.

Starting with the March 1977 CPS, for income intervals greater than \$1,000 in width, (above \$12,000) the estimates of median income and associated standard errors were calculated using Pareto interpolation. This procedure, which assumes a decreasing density of population within an income interval, is most appropriate for estimating values in the upper ranges of an income distribution. Although some of the tables shown in this report have an abbreviated income distribution, median incomes and standard errors were calculated from the most detailed distributions available.

In past reports from the CPS, linear interpolation was used almost exclusively to calculate median incomes and standard errors. After repeated testing and comparison of the old and new procedures, it was established that the Pareto method was more accurate in estimating values for the higher income groups. In contrast to the linear method, the Pareto technique uses logarithms and is applied to an income distribution cumulated from the highest to the lowest income intervals. For more information on the use of Pareto techniques, refer to the sections in this report entitled "Computation of Aggregate Income by Fifths" and "Source and Reliability of the Estimates."

## RELATED REPORTS

**Current Population Survey.** Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 107. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the **Special Labor Force Reports** of the Bureau of Labor Statistics. An advance report showing 1976 income data cross-classified by selected characteristics of families, persons, households, and the poverty population was issued as Series P-60, No. 107.

Projections of money income size distributions have been prepared from the Current Population Survey and appear in Series P-23, No. 47, "Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals." Projections have been prepared for families and unrelated individuals by age of the family head or of the individual in 1971 constant dollars for the following years: 1975, 1980, 1985, and 1990.

Data on the educational attainment and income of men have been assembled from information collected in the Current Population Survey. These data appear in Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years, 1956 to 1972." Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers.

An historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, *Trends in the Income of Families and Persons in the United States: 1947 to 1964*, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

**Decennial censuses.** Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in *1970 Census of Population, Vol. I, Characteristics of the Population*, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in *1970 Census of Population, Vol. I, Characteristics of the Population*, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, *Sources and Structures of Family Income*; 8B, *Earnings by Occupation and Education*; and 8C, *Income of the Farm-Related Population*. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the 1970 Census of Housing. Reports of the 1960, 1950, and 1940 censuses also contain various statistics on income.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the Black population and the population of Spanish origin.

Statistics on income in 1969 collected in the Current Population Survey (CPS) of March 1970 differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances. In the first place,

the CPS data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self enumerated in the 1970 census. Moreover, income data in the CPS are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within four of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median household income reported in the 1970 census was about \$8,486, 1.2 percent above the comparable figure of \$8,389 derived from the March 1970 Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, published in the American Statistical Association *Proceedings of the Social Statistics Section*, 1972.

**Survey of Income and Education.** Between April and July of 1976, the Bureau of the Census conducted a special survey called the 1976 Survey of Income and Education (SIE). The SIE was conducted in each State and consisted of approximately 151,000 interviewed households for the Nation as a whole. In compliance with the Education Amendments of 1974, preliminary estimates by State of the number of school age children below the poverty level in 1975 from the SIE have been released to Congress. Additional data from the SIE can be found in subject reports being prepared by the Bureau of the Census. A report has been published as "Household Money Income in 1975, by Housing Tenure and Residence, for the United States, Regions, Divisions, and States", *Current Population Reports*, Series P-60, No. 108. The primary focus of this report is to show income distributions by housing tenure and type of residence, cross-classified by age of head, and other key characteristics of households. During the early part of 1978, the Bureau will release a series of reports containing detailed income and poverty data from the SIE for families, persons, and unrelated individuals. There will be four reports in this series—one for each major region in the Nation. Each report will contain income and poverty data for States and divisions within a region, the region itself, and the total United States. All of these reports will appear in the P-60 series of the *Current Population Reports*.

An additional report is planned which will show data from the SIE by selected characteristics such as family status,

migration, income, and poverty. Where appropriate, this report will include comparisons between SIE and 1970 census data.

A report of the evaluation study entitled "Assessment of the Accuracy of the Survey of Income and Education," has been submitted to Congress in accordance with section 822 (b) of the Educational Amendments of 1974. This report outlines principal conclusions from the re-interview study.

Data on income and poverty for the calendar year 1975 from the SIE differ somewhat from those based on the CPS. In general, the estimates of median income from the SIE are slightly higher than comparable estimates from the CPS. For example, the median family income from the SIE was \$14,094 compared to \$13,719 from the CPS. Estimates of the number of persons below the poverty level by various characteristics from the SIE are generally lower than from the CPS. For example, there were 23,991,000 persons below the poverty level in 1975 from the SIE compared to 25,877,000 from the CPS.

Although two major aspects of these surveys were the same, the money income concept and the questionnaire wording and design, there were some significant procedural differences which probably cause the income estimates in these surveys to differ. These differences center on four main areas: (1) Survey objectives, (2) month of interview, (3) conditioning of respondents and mode of interview, and (4) interviewer experience.

**1. Survey objectives.** The major objective of the SIE was to collect accurate income information for each State and the District of Columbia. The primary purpose of the CPS is to obtain accurate statistics on the labor force; e.g., the unemployment rate with income information added as a supplement in March. Presumably the increased emphasis on collection of income data in the training of interviewers and the introductory letters to respondents led to better (i.e.,

more complete) reporting and thus contributed to differences in the results between the two surveys.

**2. Month of interview.** Virtually all interviews in the March 1976 CPS were conducted during the week of March 14 to 20. Only a small number of households were interviewed during the succeeding week. The SIE interviews took place, for the most part, in May and June, with a small number of interviews occurring in April and July. Since respondents often consult their tax returns in answering survey questions on income, the fact that the CPS interviews took place before the general April 15 deadline for filing tax returns may have disadvantages compared to the SIE survey. On the other hand, collection of data in May, June, and July for the SIE may have created significant recall problems for income and work experience during 1975.

**3. Conditioning of respondents.** It has been well documented that the repeated interviews of CPS sample households result in decreased respondent cooperation as the number of interviews increases. The SIE did not encounter these problems since all households were, in effect, being interviewed for the first time. In addition, respondent cooperation to answer income questions is affected by the mode of interview. Interviewers tend to be able to secure more complete income information in a personal interview than a telephone interview. Whereas extensive use is made of the telephone interviews in the CPS, almost all of the SIE data were collected in personal interviews.

Preliminary analysis of the SIE Data file indicates significantly lower nonresponse rates for income than those for the March 1976 CPS. Respondent conditioning and telephone interviews in the CPS are probably contributing factors to the differing income nonresponse rates.

**4. Interviewer experience.** It was necessary to hire a large number of new, temporary interviewers for the SIE. In contrast, the interviewers used for the CPS tend to be highly trained and experienced in household surveys.

---

#### **NOTE**

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

---

<sup>t</sup>BASED ON REVISED METHODOLOGY. FOR DETAILS SEE CURRENT POPULATION REPORTS, SERIES P-60, NO. 104.

<sup>1</sup>SINCE MEDIANES WERE CALCULATED USING MORE DETAILED INTERVALS THAN THOSE SHOWN ABOVE, THEY WILL NOT BE THE SAME AS THOSE CALCULATED USING THE ABOVE INTERVALS.

NOTE: FOR THE YEARS 1967 TO 1970, THE NUMBER OF WHITE AND BLACK AND OTHER RACES HOUSEHOLDS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS. THESE CONTROLS ARE NOT AVAILABLE BY RACE.

## Appendix

### DEFINITIONS AND EXPLANATIONS

**Population coverage.** This report includes the civilian noninstitutional population of the United States and approximately 954,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

**Farm-nonfarm residence.** The farm population refers to rural residents living on farms. The definition of farm and nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. In the present survey, farm residence was determined by responses to two questions: (1) "Does this place you (own/rent) have 10 acres or more?," and (2) "During the past 12 months, how much did sales of crops, livestock and other farm products from this place amount to (under \$50, \$50 to \$249, \$250 to \$999, or \$1,000 or more)?" The household was classified as in the farm population if either (a) the acreage response was "Yes" and sales amounted to \$50 or more, or (b) the acreage response was "No" and sales amounted to \$250 or more. All other households were classified as in the nonfarm population, which comprises persons living in urban areas and rural persons not on farms. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are classified as nonfarm population.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm. However, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

For detailed information on the effect of the above definitional change, see Series P-60, No. 35, pages 10 and 11.

In August 1975, the U.S. Department of Agriculture and the Bureau of the Census announced a change in the official definition of a farm. Under the new definition, as used in the 1974 Census of Agriculture, a farm is any place from which \$1,000 or more of agricultural products were sold, or would normally be sold, in the reporting year. However, for purposes of comparability, the figures presented in this report are based on the definition in use from 1960 to 1975.

**Metropolitan-nonmetropolitan residence.** The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous

counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

Starting with this report, income data are shown for the 20 largest SMSA's; these figures are based on SMSA's as defined in the 1970 census. The counties (or towns and cities) which comprised these SMSA's in the 1970 census can be found in, U.S. Census of Population: 1970, Number of Inhabitants, PC(1)-A1, United States Summary.

**Central cities.** Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

**Geographic regions.** The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

**Northeast:** Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

**North Central:** Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

**South:** Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Mississippi, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

**West:** Alaska, Arizona, Colorado, California, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

**Federal regions.** The 10 standard Federal Administrative regions for which data are presented in this report represent groups of States, as follows:

**Region I, Boston:** Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

**Region II, New York:** New Jersey, New York.

**Region III, Philadelphia:** Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia.

**Region IV, Atlanta:** Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee.

**Region V, Chicago:** Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin.

**Region VI, Dallas-Fort Worth:** Arkansas, Louisiana, New Mexico, Oklahoma, Texas.

**Region VII, Kansas City:** Iowa, Kansas, Missouri, Nebraska.

**Region VIII, Denver:** Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming.

**Region IX, San Francisco:** Arizona, California, Hawaii, Nevada.

**Region X, Seattle:** Alaska, Idaho, Oregon, Washington.

**Tenure.** A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

**Mobility status.** The population of the United States 1 year old and over has been classified according to mobility status on the basis of a comparison between the place of residence of each individual at the time of the March 1977 CPS and the place of residence 2 years earlier. Nonmovers are all persons who were living in the same house at the beginning and end of the period. Movers are all persons who were living in a different house at the end of the period than at the beginning of the period. Movers from abroad include all persons, either citizens or aliens, whose place of residence was outside the United States at the beginning of the period, that is, in an outlying area under the jurisdiction of the United States or in a foreign country.

**Income.** For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or

government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., \$10,000 to \$15,000 was coded as \$12,500). Open-ended amounts were converted to designated specific amounts; e.g., over \$10,000 may be coded as \$15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of households refer to the time of the survey. The income of the household does not include amounts received by persons who were members of the household during all or part of the income year if these persons no longer resided with the household at the time of enumeration. On the other hand, household income includes amounts reported by persons who did not reside with the household during the income year but who were members of the household at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some households receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm households receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to under-report their income. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc.

The various sources for which income is reported are defined as follows:

**Money wages or salary** is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

**Net income from nonfarm self-employment** is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts

include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.

**Net income from farm self-employment** is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

**Social Security** includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. "Medicare" reimbursements are not included.

**Supplemental Security income** includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

**Public assistance or welfare payments** include public assistance payments such as aid to families with dependent children and general assistance.

**Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties** include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

**Unemployment compensation, veterans' payments, or workmen's compensation** include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of

unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

**Private and government employee pensions include:** (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

**Annuities, alimony, regular contributions from persons not living in the household, and other periodic income** include the following types of income: (1) Periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

**Receipts not counted as income.** Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

**Total money earnings**—the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

**Income other than earnings**—the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

**Total money income.** This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings. The total income of a household is the algebraic sum of the amounts received by all income recipients in the household.

The income tables for households include in the lowest income group (under \$1,000) those that were classified as having no income in 1976 and those reporting a loss in net income from farm and nonfarm self-employment or in rental

income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted households, unrelated individuals who had recently left families, or households in which the sole bread-winner had recently died or had left the household. However, many of the households who reported no income probably had some money income which was not recorded in the survey.

**Median income.** The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

**Mean income.** The mean income is the amount obtained by dividing the total income of a group by the number of households or persons (as appropriate) in that group.

**Per capita income.** Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

**Household.** A household consists of all the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants. The count of households excludes persons living in group quarters, such as rooming houses, military barracks, and institutions.

The number of households is the same as the number of primary families and primary individuals combined yet the median income of households, as shown in this report, is \$12,686. The median income of primary families and primary individuals combined is slightly less, \$12,433. The reason for the difference in the two median incomes is the fact that the incomes of secondary family members and secondary individuals in households are included in determining the "households income," but the incomes of these persons are not included with the income of the primary family or primary individual with whom they live in determining the "income of primary families and primary individuals combined."

Even though median household income is higher than the median income of "primary families and primary individuals combined," median household income is 15 percent less than median family income. The main reason for the lower household income is the inclusion of incomes of primary individuals in the household income concept. Eighty-eight percent of all primary individuals live alone in one-person households, and the median income of one-person households is relatively low, only \$5,365 in 1976.

Thus, the key difference between statistics for households and those for families and unrelated individuals lies in the way the population is aggregated for the purpose of counting units, especially in the treatment of household members who are not related to the head (most of whom are secondary individuals) and group quarters members who are not inmates of institutions (all of whom are secondary individuals).

**Family.** The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as secondary families (in households) and not as part of the household head's family. Beginning in 1968, secondary families in group quarters (only 37,000 in 1967) are no longer shown; instead the members are classified as secondary individuals in group quarters.

**Unrelated individuals.** The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

**Primary families and individuals.** The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

**Secondary individual.** A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

**Group quarters.** Group quarters are living arrangements for institutional inmates regardless of the number of inmates, or for other groups containing five or more persons unrelated to the person in charge.

**Head of household.** One person in each household was designated as the "head." The number of heads, therefore,

is equal to the number of households. The head of a household is usually the person regarded as the head by members of the household. Women are not classified as heads if their husbands are resident members of the household at the time of the survey. Married couples related to the head of a household are included in the head's household and are not classified as separate households.

**Size of household.** The term "size of household" refers to the number of persons occupying a housing unit.

**Number of related children under 18 years of age.** This number refers to all children in the household under 18 years old related to the head of the household by blood, marriage, or adoption.

**Marital status.** The marital status classification identifies four major categories: Single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, wife present," "separated," and "other married, wife absent" for male heads and "married, husband absent" by reason for absence of husband for female heads. A male head was classified as "married, wife present" if his wife was reported as a member of the household, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently, or temporarily separated because of marital discord. The groups "other married, wife absent" and "other married, husband absent" include married persons living apart because either the wife or the husband was employed, and living at a considerable distance from home, was residing in an institution, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

**Husband in Armed Forces.** When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

**Age.** The age classification is based on the age of the person at his last birthday.

**Race.** The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. "Other races" are sometimes shown in combination with the Black population.

**Persons of Spanish origin.** Persons of Spanish origin in this report were identified by a question that asked for

self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

**Years of school completed.** Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

**Labor force and employment status.** The definitions of labor force and employment status in this report relate to the population 14 years old and over.

**Employed.** Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

**Unemployed.** Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-

seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

**Labor force.** Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

**Not in the labor force.** All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

**Occupation.** The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings included in this report with 1976 income data were derived from occupation subgroups delineated on the basis of the classification system used in the 1970 census. For further information, see the article by John A. Priebe, Joan Heinkel, and Stanley Greene entitled "1970 Occupation and Industry Classification in Terms of Their 1960 Occupation and Industry Elements," Technical Paper 26, Bureau of the Census, July 1972.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "crafts").

The major occupation groups are combined into four divisions, as follows:

**White-collar workers.** Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

**Blue-collar workers.** Craft and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

**Farm workers.** Farmers and farm managers; and farm laborers and supervisors.

**Service workers.** Service workers, excluding private households; and private household workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

**Work experience.** A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

**Weeks worked in the income year.** Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

**Part-time or full-time jobs.** A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

**Year-round full-time worker.** A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

**Nonworker.** A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

**Symbols.** A dash "—" represents zero, and the symbol "B" means that the base for the derived figure is less than 75,000. Three dots "... ." mean not applicable and the symbol "r" means revised.

**Rounding.** Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

**Base figures.** The base figures shown in this report were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for years 1967 to 1970 were inflated to estimates derived from the 1960 census. A more detailed explanation of this change can be found in an article entitled "Revisions in Current Population Survey" Employment and Earnings, Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

**Computation of aggregate income by fifths.** The data shown in this report on aggregate income and dollar cutoffs for fifths (and top 5 percent) of households, ranked by size of their total household income, were calculated using two different procedures. In table 4, aggregate income and dollar cutoffs by fifths were derived directly from the Current Population Survey micro-data file using actual income amounts.

In contrast, the data shown in table 5 were calculated using estimates from grouped data, as described below:

1. In calculating the aggregate income by fifths (and top 5 percent) of households using grouped data, the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For the top open-end interval (\$50,000 and over) a Pareto distribution was fitted to the data in the interval just below the open-end interval (\$25,000 to \$49,999). This fitted distribution was then extrapolated to estimate the number of households with incomes greater than \$100,000. The mean income of households with greater than \$100,000 was assumed to be \$100,000 exactly.<sup>1</sup> The mean income for the \$50,000 to \$100,000 interval was estimated from the same fitted Pareto distribution. Below the "\$50,000 and over" interval, a Pareto distribution was fitted to each separate income interval. If the absolute value of the slope parameter of the fitted Pareto distribution was greater than one, the mean income of the interval was estimated from the fitted Pareto distribution. If the absolute value of the slope parameter was less than or equal to one, the midpoint of the interval was used as the estimated mean of the interval.

2. The upper income levels (quantiles) of each fifth and the top 5 percent of households were estimated using either linear or Pareto interpolation depending upon the methods used to estimate the mean income in the interval in which the quantile was located (reference interval). After determining a particular quantile, the aggregate income above this quantile was calculated by estimating the aggregate income of the subinterval between the quantile and the next higher actual income interval and adding the result to the aggregate income above the reference interval. The aggregate income of the subinterval was determined using the method (either Pareto or linear interpolation) consistent with that used for estimating the quantile and the mean income of the reference interval. The aggregate incomes between the quantiles were determined by disaccumulating the aggregate income distribution.

3. The two methods for determining aggregate income and dollar cutoffs for fifths of households produce some slight discrepancies, particularly for the highest fifth and top

5 percent of households. For the current year, the data shown in table 4 are preferable, since no interpolation was involved.

For more information on the use of Pareto techniques, see "Estimation of Summary Measures of Income Size Distribution From Grouped Data," by Emmett F. Spiers, published in the American Statistical Association, *Proceedings of the Social Statistics Section, 1977.*

**Computation of constant dollar distributions.** The adjustment for price change was made by converting the income distribution for households for each year (1967 to 1975) into 1976 dollars on the basis of the change in the Consumer Price Index. The indices used to make the constant dollar conversions are shown in table A-1. In choosing a procedure to make this conversion, two fundamental assumptions concerning income data were made: (1) Price changes have the same proportional effect on various income levels and (2) the distribution within each income interval follows a Pareto distribution. The following procedure satisfies these two assumptions.

**Table A-1. Consumer Price Index: 1967 to 1976  
(1967=100)**

YEAR	CPI
1967	100.0
1968	104.2
1969	109.8
1970	116.3
1971	121.3
1972	125.3
1973	133.1
1974	147.7
1975	161.2
1976	170.5

Source: Monthly Labor Review, May 1977, Department of Labor, Bureau of Labor Statistics.

The first step required the accumulation of the income distribution, starting with the highest income interval and cumulating to the lowest income interval. Next, the limits of each income interval were converted into 1976 dollars by adjusting them by a factor representing the change on the basis of that year's price index (1976 = 100). Finally, the number of households in each of the detailed class intervals were computed by logarithmic interpolation and then combined into broad income intervals.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of households because separate price indices have not been developed for households in different income class intervals. In addition, the available

<sup>1</sup> Individual income amounts greater than or equal to \$100,000 are recorded as \$99,999 in the Current Population Survey.

data did not permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the household income data cover also household savings and income tax payments. For these and other reasons, the constant dollar figures, particularly in the income range over \$10,000, are to be regarded as approximations.

## COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

**Bureau of Economic Analysis (BEA) personal income series.** The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

**1. Income definition.** The personal income series include, among other items, the following types of non-money income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

**2. Source of data.** The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employer's wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and Reliability of the Estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income

surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

**3. Population coverage.** The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

**4. Average income.** The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for households, families, unrelated individuals, or income recipients 14 years old and over.

**Department of Agriculture farm income series.** The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney

income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, *Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income"* released in Sept. 1969.

**Federal income tax data.** For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than \$2,450 (less than \$3,200 if 65 years old or over) and married couples receiving less than \$3,600 (\$4,350 if one spouse is 65 years old or over; \$5,100 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

**Old-Age, Survivors', Disability, and Health Insurance earnings record data.** Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act,

and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of \$15,300 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

## COMPARABILITY OF ESTIMATES FROM THE MARCH 1977 CPS WITH ESTIMATES FOR PREVIOUS YEARS

Estimates from the March 1977 CPS are in some instances not strictly comparable with estimates for previous years due to several factors. Among these factors are changes in: (1) population controls and metropolitan residence definitions; (2) collection of income and work experience data; (3) nonresponses and allocations; (4) questionnaire wording and procedures; and (5) changes in sample size and interpolation procedures. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

### Population Controls and Metropolitan Residence Definitions

The data for 1971 through 1976 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls; thus providing some measure of the impact of the changes (see table 3, *Current Population Reports*, Series P-60, No. 91). Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings such as the total number of persons or families either overall; within some particular income

interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, **Employment and Earnings**, Vol. 18, No. 8, February 1972.

The figures shown in this report for metropolitan areas are based on the standard metropolitan statistical areas (SMSA's) as defined on the basis of the 1970 census; those published prior to the March 1973 CPS referred to SMSA's as defined on the basis of the 1960 census. There are significant differences in the population classified as metropolitan from each of these definitions. For the 1970 definition of SMSA's, see U.S. Census of Population: 1970, **Number of Inhabitants**, PC(1)-A1, United States Summary.

### **Collection of Income and Work Experience Data**

This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey, in order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, **Special Labor Force Reports**, "Work Experience of the Population". The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the **Special Labor Force Reports** relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but, also,

many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

### **Nonresponses and Allocations**

In the March 1977 CPS, no information was recorded for approximately 5 percent of the 56,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 23 percent of all families and 20 percent of unrelated individuals 14 years old and over. Overall, about 17 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, **Proceedings of the Social Statistics Section**, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958 a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and

individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See *Current Population Reports*, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, *Proceedings of the Social Statistics Section, 1969*.

Starting with the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of these procedures was a more refined method for imputing missing income data which expanded the use of information already known about that person. Among the major improvements made affecting the income data were the following: (1) An expanded set of social and economic characteristics within which the imputations were made; in addition to age, race, occupation, and weeks worked, the procedures included sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks-worked; and (3) the imputation procedure assigned missing earnings entries first and then utilized the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, *Proceedings of the Social Statistics Section, 1969*. See also "Current Developments on Collecting Income Data in the Current Population Survey," by Mitsuo Ono, published in the American Statistical Association, *Proceedings of the Social Statistics Section, 1971*.

In processing the data collected in the March 1976 Current Population Survey, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. The revised system incorporated many improvements in the income edit and allocation procedures. The main feature of these procedures was a more refined method for inputting missing responses to the income and work experience questions on the March CPS questionnaire.

There were two main objectives in the revisions of the imputation procedures for income, work experience, and longest job. The first objective was to expand the detail and number of demographic and economic characteristics used in making imputations. Since nonrespondents are assigned information from respondents with "similar" characteristics, the degree of bias due to nonresponse may be reduced by incorporating more detailed information in the imputation procedures. The second objective was to maintain - wherever possible - observed relationships for respondents among income, work experience, and longest job variables in imputing missing information for nonrespondents. A detailed

discussion of these improvements and the subsequent revisions to the 1974 income data (for comparability with 1975 data) can be found in *Current Population Reports*, Series P-60, No. 104.

## Questionnaire Wording and Procedures

**Modifications in collecting income data in the March-April 1969 CPS.** Several modifications were introduced in the collection of income data in the March and April CPS supplements. These include (1) extension of the interview period of the six rotation groups for which income questions were asked in March and the use of follow-up forms in these six groups to accommodate household respondents who needed more time to obtain the required income information (it is estimated that some members of approximately 4,400 households, or 9 percent of the total relevant households, made use of these follow-up forms); (2) modification of the design and content of the questionnaire to allow for more detailed questioning of certain income items; thus, boxes for gross receipts, business expense, and net income have been added to the self-employment income questions to help the interviewer and respondent determine net income, and "yes-no" circles were added to the questions on income other than earnings in order to ascertain whether the respondent received or did not receive income; (3) field office editing procedures were extended to a 100 percent income edit of the CPS schedules; (4) training instructions were strengthened by including more detailed explanations and more examples; and (5) the interview group training session was shifted from February to March.

**Modifications in collecting income data in the March 1970 Current Population Survey.** The Bureau introduced modifications in the collection of income data for the March 1970 CPS supplement. These were: (1) An advance letter informing households about the collection of income data was mailed to all households except those in the first and fifth months. The latter households received special letters which explained the need for collecting both CPS and census data; (2) information on work experience and income was collected simultaneously for the full sample (in previous years, work experience information was collected separately from income data); (3) the interview period was extended one week for three-fourths of the sample (using follow-up calls and separate questionnaires). In addition, modified procedures which were incorporated in the March 1969 CPS supplement were also implemented in the March 1970 CPS. Overall, data indicate that the use of these procedures has resulted in some improvement in the collection of income data. The family income nonresponse rate has not only dropped by 5 percentage points (from 19 to 14 percent) but also it appears that the proportion of aggregate income amounts collected in the March 1970 CPS relative to benchmark totals has increased slightly.

in the March 1970 CPS supplement as compared with the proportion collected in the March 1969 CPS supplement.

**Modifications in collecting income data in the March 1971 Current Population Survey.** The Bureau continued to use the improved procedures which were incorporated in the March 1970 CPS. Procedural changes that were instituted in the March 1971 CPS, among others, were:

1. The interview period was extended one week for all households in the sample (using follow-up calls and separate questionnaires). In the previous year's survey, the interview period was extended for only three-fourths of the sample.

2. Income from net royalties was included in the question covering estates, trusts, or dividends, interest on savings accounts or bonds, and net rental income. In previous surveys, income from net royalties was included in the question covering private pensions, annuities, alimony, regular contributions from persons not living in this household, and anything else.

3. An additional regional office follow-up was made by telephone to obtain income amounts for all follow-up cases containing one or more persons who were not interviewed during the original follow-up period, except for refusal.

**Modifications in collecting income data in the March 1975 Current Population Survey.** Several modifications in the design and content of the questionnaire were introduced in the March 1975 CPS to allow for more detailed questioning of certain income items. These changes were:

1. In the March 1974 CPS, income from aid to families with dependent children, old age assistance, and aid to the blind or totally disabled were asked in one combined question on welfare payments. Beginning in January 1974, the programs for old age assistance and aid to the blind or totally disabled were replaced by the Supplemental Security program. Therefore, in the March 1975 CPS a separate question was asked for the receipt of Supplemental Security income. Income from aid to families with dependent children or any other assistance was asked under the general category of public assistance or welfare payments.

2. In the March 1974 CPS, income from interest, net rental income or income from estates, trusts, or dividends was asked in one question. In the 1975 CPS these income types were asked as two questions with income received from interest on savings accounts or bonds included in one question and income from estates, trusts, or dividends in the other.

3. In the March 1974 CPS, income received from private pensions was asked along with alimony and certain other income items while income from government employee pensions was asked along with veterans' payments, unemployment compensation and workmen's compensation.

In the March 1975 CPS, income received from both private and government employee pensions (including military retirement) were extracted from their previous categories and asked as one combined question.

**Modifications in collecting income data in the March 1977 Current Population Survey.** In the March 1977 CPS there were two modifications in the wording of the questionnaire. These two changes were:

1. In the March 1976 CPS, the respondent was asked if he or she received any income from "interest on saving accounts, bonds, etc." In the March 1977 CPS, the wording was changed to "interest on savings or bonds, etc. Include even small amounts credited to ...'s account."

2. In the March 1976 CPS, income from "anything else" was asked along with alimony or child support and other regular contributions from persons not living in the household. In the March 1977 CPS, the wording "anything else" was changed to "any other money income."

### Changes in Sample Size and Interpolation Procedures

The income statistics tabulated from the March 1977 CPS reflect two important modifications of procedures from those used in previous surveys. These changes involved the use of (1) an expanded sample of housing units and (2) refined interpolation procedures for calculating median incomes and their respective standard errors. For further details, refer to the section in this report entitled "New Procedures Used in the March 1977 CPS" on page 4.

Along with the new processing system in the March 1976 CPS, there were also revisions to the display tables including an expanded set of income intervals above \$10,000. As a result, estimates of median income exceeding \$10,000 are not strictly comparable to the previously published values because interpolation calculations are now performed using different size/income intervals than used before the March 1976 CPS. For more details on this matter refer to *Current Population Reports, Series P-60, No. 104, p.7*.

### UNDERREPORTING OF INCOME

It is known that income data are usually underreported in household surveys, such as the Current Population Survey (CPS), when compared with independently derived estimates from administrative sources. A number of articles on this general problem can be found in *An Appraisal of the 1950 Census Income Data*, Volume 23 of *Studies in Income and Wealth*, National Bureau of Economic Research, 1958. Another publication covering this same topic is *The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States*, prepared by T. Paul Schultz for use of the Subcommittee on

Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964.

As noted previously, overall aggregate money income compiled in the CPS during the past few years has been about 90 percent of the estimate derived from independent sources.

In 1975, the highest proportions of aggregate income compiled in the CPS were 97 percent for both wage or salary income and nonfarm self-employment income. The proportion picked up for Social Security and railroad retirement payments was 91 percent while the comparable rate for public assistance or welfare payments was 77 percent. Among the lowest rates were 57 percent for farm self-employment income and 42 percent for interest paid on savings or bonds. Independently derived estimates are compiled from data provided by the Bureau of Economic Analysis, Social Security Administration, Veterans' Administration, etc. For more details regarding the procedures to develop independent data sources, see the following: (1) "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in *Studies in Income and Wealth*, Volume 13, National Bureau of Economic Research, 1951 and (2) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis Staff Paper No. 21, BEA-SP 73-021, June 1973.

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contributions from nonhousehold

members, (2) reluctance to reveal certain types of income types, e.g., public assistance, (3) rounding estimates, (4) misunderstanding the question, (5) lack of information, especially covering family members not present at the time of interview, (6) interviewers' errors, (7) processing errors, etc.

For more details on this topic of income underreporting in censuses and surveys, see: (1) *Income Distribution in the United States* (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) *The Structure of Income*, by Irving B. Kravis, University of Pennsylvania, 1962 and, (3) "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, as previously cited.

## SOURCE AND RELIABILITY OF THE ESTIMATES

**Source of data.** The estimates in this report are based on data obtained annually in March of 1968 through 1977 from the Current Population Survey (CPS) of the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about money income for the previous year. Brief descriptions of the sources and the procedures by which the data were obtained are presented below.

### Brief Description of the Current Population Survey

Time period	Number of sample areas <sup>1</sup>	Households occupied		Households visited, not occupied
		Interviewed	Not interviewed	
Supplemental sample.....	153	8,500	500	1,500
Aug. 1972 to present.....	461	45,000	2,000	8,000
Aug. 1971 to July 1972.....	449	45,000	2,000	8,000
Jan. 1967 to July 1971.....	449	48,000	2,000	8,500

<sup>1</sup> These areas were chosen to provide coverage in each State and the District of Columbia, with the exception of the supplementary sample used for March 1977 income data.

The present CPS sample was initially selected from the 1970 census files and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below). Samples for previous sample designs were selected from files from the most recently completed

census. The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1977 income

data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the Nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

The estimation procedure used for the monthly CPS data involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that the husband and wife of a household received the same weight.

**Reliability of the estimates.** Since the estimates in these tables were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

**Nonsampling variability.** As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of respondents to provide correct information, inability to recall information, mistakes made in collection such as in recording or coding the data, mistakes made in processing the data, mistakes made in estimating values for missing data, and failure to represent all units with the sample (undercoverage). The approximate magnitude of two sources of undercoverage in CPS is described next.

Approximately 600,000 conventional new construction units were issued building permits prior to the 1970 census but building was not completed by the time of the census (i.e., April 1970); these units have no representation in the CPS sample. Conventional new construction, for which building permits were issued after the 1970 census, is represented. In addition to undercoverage of conventional new construction, CPS missed at least 200,000 new mobile

homes. These are missed because there is no systematic sampling procedure to provide representation of mobile homes constructed since the 1970 census.<sup>2</sup>

In most cases the schedule entries for income are based on the memory or knowledge of one person; usually the wife. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

**Sampling variability.** The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g.; by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

**Note when using small estimates.** Summary measures (such as means, medians, and percent distributions) are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

**Standard error tables and their use.** In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

---

<sup>2</sup>These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less.

The figures presented in tables A-2 and A-3 provide approximations to standard errors of estimated numbers and estimated percentages for households in the United States. Estimated standard errors cannot be obtained from tables A-2 and A-3 without the use of the "f" factors in table A-4. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and the estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. Standard errors of estimated means and medians are provided in the detailed tables.

Two parameters are used (denoted as "a" and "b") to calculate standard errors for each type of characteristic; they are presented in table A-4. These parameters were used to calculate the tabulated standard errors in tables A-2 and A-3 and to calculate the "f" factors in table A-4. They also may be used to calculate the standard errors for estimated numbers and estimated percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables. Methods for direct computation are given in the following sections.

**Standard errors of estimated numbers.** The approximate standard error,  $\sigma_x$ , of an estimated number can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where  $f$  is the appropriate factor from table A-4 and  $\sigma$  is the standard error for households obtained by interpolation from table A-2. Alternately, standard errors may be approximated by the following formula, (2), from which the standard errors were calculated in table A-2. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here  $x$  is the size of the estimate and  $a$  and  $b$  are the parameters in table A-4 associated with the particular type of characteristic.

**Standard errors of estimated percentages.** The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error,  $\sigma(x,p)$ , of an estimated percentage can be obtained by use of the formula

$$\sigma(x,p) = f\sigma \quad (3)$$

In this formula  $f$  is the appropriate factor from table A-4 and  $\sigma$  is the standard error for households in table A-3. Alternately, standard errors may be approximated by the following formula, (4), from which the standard errors in table A-3 were calculated; direct computation will give more accurate results than use of the standard error table and the factors.

$$\sigma(x,p) = \sqrt{\frac{b}{x} \cdot p(100-p)} \quad (4)$$

Here  $x$  is the size of the subclass of the households which is the base of the percentage,  $p$  is the percentage ( $0 \leq p \leq 100$ ), and  $b$  is the parameter in table A-4 associated with the particular type of characteristic in the numerator of the percentage.

**Illustration of use of standard error tables.** Table 9 of this report shows that in 1976 there were 1,179,000 households with incomes of \$50,000 or more. Table A-2 shows the standard error on an estimate of this size to be approximately 34,000. Applying the appropriate "f" factor from

**Table A-2. Standard Errors of Estimated Numbers of Households: 1967 to 1976**

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	5,000.....	72
250.....	16	10,000.....	99
500.....	23	25,000.....	147
1,000.....	32	50,000.....	182
2,500.....	51	75,000.....	186

table A-4 and using formula (1) the approximate standard error is  $1.0 \times 34,000 = 34,000$ .<sup>3</sup> The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 34,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 68,000 (twice the standard error). Of these 1,179,000 households with incomes of \$50,000 or more, 282,000, or 23.9 percent, are located in the Northeast region. Since the numerator of this percentage is households in the Northeast region and the characteristic relates to income, the b parameter from table A-4 is 1221.5653; using formula (4) the standard error on an estimate of 23.9 percent is

$$\sqrt{\frac{1221.5653}{1,179,000}} \cdot 23.9 (100 - 23.9) = 1.4 \text{ percent}$$

Consequently, the chances are 68 out of 100 that the estimated 23.9 percent would be within 1.4 percentage points of a complete census figure. Chances are 95 out of 100 that the estimate would be within 2.8 percentage points of a complete census figure, i.e., the 95-percent confidence interval would be from 21.1 to 26.7 percent.

**Standard error of a difference.** For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated char-

<sup>3</sup> Formula (2) gives a standard error of 35,000.

acteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

**Illustration of the computation of the standard error of a difference.** Table 9 of the report shows that the median household income in the Northeast in 1976 was estimated to be \$13,074 while the estimated median household income in the South for 1976 was \$11,461. Table 9 also shows the approximate standard errors on these estimated medians to be \$114 and \$108, respectively.

To get the standard error of the estimated difference,  $\sigma(x-y)$ , use the following formula:

$$\sigma(x-y) = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (5)$$

Therefore, the standard error of the difference of \$1,613 is

$$157 = \sqrt{(114)^2 + (108)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than \$157. The 68-percent confidence interval about the \$1,613 difference is from \$1,456 to \$1,770, i.e.,  $\$1,613 \pm \$157$ . A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is \$1,299 to \$1,927. Thus, we can conclude with 95-percent confidence that there is a significant difference between the 1976 median income for households in the two regions.

Table A-3. Standard Errors of Estimated Percentages of Households: 1967 to 1976

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50

<sup>1</sup>For metropolitan areas, multiply the "a" and "b" parameters by 2. To obtain the appropriate "f" factor, multiply by 1.4.

<sup>2</sup>The factors for "income" should be used to estimate the standard error for the number (or percentage) of households in a specified income range; otherwise, the factors for "non-income" should be used.

<sup>3</sup>The "f" factors are to be used for calculating standard errors of percentages only. For standard errors of estimated numbers the appropriate "a" and "b" parameters and formula (2) must be used.

Note: The "a" and "b" parameters are used to estimate variances for the given type of characteristics. The "f" factors are used for the given type of characteristic with the standard errors in tables A-2 and A-3.

**Standard error of a ratio.** Certain mean values for persons in households shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in households}}{\text{total number of households}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator  $y$  represents a count of households of a certain class, and the numerator  $x$  represents a count of persons with the characteristic under consideration who are members of these households.

**Case 1:** There is at least one person having the characteristic in every household of the class: as for example, the mean number of persons per household or the mean number of persons per household with a male head. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\left(\frac{x}{y}\right)} = \sqrt{\left(\frac{x}{y}\right)^2 \left[ \left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right) \left(\frac{\sigma_y}{y}\right) \right]} \quad (6)$$

The standard error of the estimated number of households,  $\sigma_y$ , and the standard error of the estimated number of persons with the characteristic in those households,  $\sigma_x$ , may be calculated by the methods described above. In formula (6),  $\rho$  represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of  $\rho$ .

**Case 2:** The number of persons having the characteristic in a given household may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age. For ratios of this kind the standard error is approximated by formula (6) but  $\rho$  is assumed to be zero. If  $\rho$  is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

**Estimation of median incomes.** Starting with the March 1977 CPS, for income intervals greater than \$1,000 (i.e., above \$12,000), estimates of median income and associated standard errors have been calculated using Pareto interpolation. Pareto interpolation assumes a decreasing density of population within an income interval, whereas, linear interpolation assumes a constant density of population within an income interval. Therefore medians calculated using Pareto interpolation are necessarily smaller than those calculated using linear interpolation. In past reports from the CPS, linear interpolation was used almost exclusively to calculate

median incomes. Thus, caution must be used in comparing the 1976 medians with the medians for previous years when the 1976 median is larger than \$12,000. An indication of the comparability of medians calculated using Pareto interpolation with medians calculated using linear interpolation can be seen in table A-5.

**Standard errors of estimated means and medians.** Estimated standard errors are provided for the means and medians of the published income distributions and do not need to be calculated by the user. However, some users may wish to combine two or more income distributions and compute means and medians for the combined distribution. The following sections are provided to enable the user to calculate standard errors for estimates of means and medians for the combined distributions.

**Estimating the standard error of the mean.** The standard error of a mean can be approximated by formula (7) below. Because of the approximations used in developing formula (7), an estimate of the standard error of the mean obtained from that formula will generally underestimate the true standard deviation. The formula used to estimate the standard error of a mean is

$$s_{\bar{x}} = \sqrt{\frac{b}{y} s^2} \quad (7)$$

where  $y$  is the size of the base and  $b$  is a constant which depends on the sample size, the sample design, the estimation procedure, and the type of characteristic. The  $b$  values are given in table A-4. The variance,  $s^2$ , is given by formula (8):

$$s^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2 \quad (8)$$

where  $\bar{x}$  is the mean of the distribution;  $c$  is the number of groups;  $i$  indicates a specific group, thus taking on values 1 through  $c$ ;

$p_i$  is the estimated proportion of households whose values, for the characteristic ( $x$ -values) being considered fall in group  $i$ ;

$\bar{x}_i = (Z_{i-1} + Z_i)/2$ , where  $Z_{i-1}$  and  $Z_i$  are the lower and upper interval boundaries, respectively, for group  $i$ ;

$\bar{x}_i$  is assumed to be the most representative value for the characteristic for households in group  $i$ . Group  $c$  is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is  $\bar{x}_c = \frac{3}{2} Z_{c-1}$ .

When two or more distributions are combined the mean of the combined distribution is:

$$\bar{x} = \frac{1}{y} \sum_j \bar{x}_j y_j$$

where  $\bar{x}_j$  is the mean of the  $j$ th distribution,  $y_j$  is the base of the  $j$ th distribution, and  $y = \sum_j y_j$ . This mean must be computed by the user.

**Standard error of a median.** The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data:

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution;
2. Add to and subtract from 50 percent the standard error determined in step (1);
3. Using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step (2).

For calculation of the confidence interval use Pareto interpolation for any point in an income interval greater than \$1,000 in width, and linear interpolation otherwise.

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

The formulae used to implement step (3) for Pareto or linear interpolation are:

$$\text{Pareto: } x_p = A_1 \exp \left[ \frac{\ln \left( \frac{p}{p_1} \right) \ln \left( \frac{A_2}{A_1} \right)}{\ln \left( \frac{p_2}{p_1} \right)} \right] \quad (9)$$

and

$$\text{Linear: } x_p = \frac{p_1 - p}{p_1 - p_2} (A_2 - A_1) + A_1 \quad (10)$$

where

$x_p$  = estimated income for which the percentage  $p$  ( $0 \leq p \leq 100$ ) of the households in the distribution have larger incomes. For the purposes of calculating the confidence interval,  $p$  takes on the two values calculated in step (2). Note that the median can be approximated by using  $p = 50$  in the formulae.

$A_1$  and  $A_2$  = the estimated incomes which are the lower and upper bounds, respectively, on the interval in which  $x_p$  falls.

$p_1$  and  $p_2$  = the percent of households with incomes greater than  $A_1$  and  $A_2$ , respectively.

$\exp$  refers to the exponential function.

$\ln$  refers to the natural logarithm function.

**Table A-5. Comparison of Estimated Household Median Incomes in 1976 and Associated Standard Errors Using Pareto Interpolation and Linear Interpolation: March 1977 CPS**

(For meaning of symbols, see text.)

Selected characteristics of households	Pareto interpolation		Linear interpolation	
	Median income	Standard error	Median income	Standard error
Total, United States.....	\$12,686	\$47	\$12,731	\$47
<b>REGION</b>				
Northeast.....	13,074	114	13,107	108
North Central.....	13,683	117	13,701	126
South <sup>1</sup> .....	...	...	11,461	108
West.....	13,038	128	13,073	122
<b>CHARACTERISTICS OF HEAD</b>				
Four or more years of college.....	20,208	131	20,233	143
Professional, technical, or kindred worker.....	19,795	169	19,823	149

<sup>1</sup>Linear interpolation was used to estimate the median household income for the South region since the median was less than \$12,000.

If the calculations of the logarithms in formula (9) are not convenient, then formula (10) can be used as a rough approximation for the standard error of a median for which Pareto interpolation is used.

**Illustration of the computation of a confidence interval for a median using pareto interpolation.** Table 8 of this report shows the median household income in the United States in 1976 was estimated to be \$12,686. Table 8 also shows that the base of the distribution from which this median was determined is 74,142,000 households.

- (1) Using formula (4) the standard error of 50 percent on a base of 74,142,000 is about 0.2 percent.
- (2) To obtain a 95-percent confidence interval on an estimated median add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 49.6 and 50.4.
- (3) From table 8 the income of 52.9 percent of the households was greater than \$12,000 and the income of 47.0 percent of the households was greater than \$13,500. Thus, the entire 95-percent confidence interval falls in the income interval \$12,000 to \$13,500. Therefore, the median income and the upper and lower limits on the confidence interval are to be calculated using Pareto interpolation. Thus, using formula (9), the lower limit on the estimate is found to be about

$$\$12,000 \exp \left[ \frac{\ln \left( \frac{50.4}{52.9} \right) \ln \left( \frac{\$13,500}{\$12,000} \right)}{\ln \left( \frac{47.0}{52.9} \right)} \right] = \$12,593$$

Similarly, the upper limit may be found by Pareto interpolation to be about

$$\$12,000 \exp \left[ \frac{\ln \left( \frac{49.6}{52.9} \right) \ln \left( \frac{\$13,500}{\$12,000} \right)}{\ln \left( \frac{47.0}{52.9} \right)} \right] = \$12,795$$

Thus, the 95-percent confidence interval on the estimated median is from \$12,593 to \$12,795.

**Illustration of the computation of a confidence interval for a median using linear interpolation.** Table 8 of this report shows that the median household income in the South Census region of the United States in 1976 was estimated to be \$11,461. Table 8 also shows that the base of the distribution from which this median was determined is 23,669,000 households.

- (1) Using formula (4) the standard error of 50 percent on a base of 23,669,000 is about 0.4 percent.
- (2) To obtain a 95-percent confidence interval on an estimated median add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits 49.2 and 50.8.
- (3) From table 8 the income of 51.7 percent of the households was greater than \$11,000 and the income of 48.0 percent of the households was greater than \$12,000. Thus, the entire 95-percent confidence interval falls in the income interval \$11,000 to \$12,000. Therefore, the median income and the upper and lower limit on the confidence interval are to be calculated using linear interpolation. Thus, using formula (10), the lower limit on the estimate is found to be about

$$\frac{51.7 - 50.8}{51.7 - 48.0} (\$12,000 - \$11,000) + \$11,000 = \$11,244$$

Similarly, the upper limit may be found by linear interpolation to be about

$$\frac{51.7 - 49.2}{51.7 - 48.0} (\$12,000 - \$11,000) + \$11,000 = \$11,676$$

Thus, the 95-percent confidence interval on the estimated median is from \$11,244 to \$11,676.
