# Characteristics of Households Receiving Selected Noncash Benefits: 1982 (Advance Data From the March 1983 CPS)

## INTRODUCTION

This report contains data on the characteristics of households receiving noncash benefits in 1982. These data were obtained from the March 1983 Current Population Survey (CPS) conducted by the Bureau of the Census. Non-cash benefits can be defined as benefits received in a form other than money that serve to enhance or improve the economic well-being of the recipient. Data collection in March 1983 concentrated on two major categories of noncash benefits: those that are usually defined as public transfers and employer- or union-provided benefits to employees. In the area of public noncash transfers, the survey covered the following programs: the Food Stamp Program, the National School Lunch Program, public and other subsidized rental housing, Medicare health insurance, Medicaid health insurance, and CHAMPUS, VA, or military health insurance. Data were collected for two types of employer- or union-provided noncash benefits: pension plans and group health insurance plans.

## HIGHLIGHTS

In 1982, 74.9 million (or 89 percent) of the households in the United States received at least one of the types of noncash benefits covered by the survey. This was about the same as the number of households receiving noncash benefits in 1981. The number of households receiving at least one means-tested noncash benefit, which included food stamps, free or reduced-price school lunches, publicly owned or subsidized rental housing, and Medicaid was 14.6 million in 1982, not significantly different from the 1981 figure. The poverty rate for households increased from 14.0 to 14.5 percent between 1981 and 1982.<sup>1</sup>

<sup>1</sup>For this report poverty status was computed on a household basis rather than on the basis of families and unrelated individuals.

The number of households receiving nonmeans-tested benefits, which included Medicare, regular-price school lunches, employer- or union-provided pension plans, and employer- or union-provided group health plans, in 1982 showed no statistically significant change from 1981. The number of households receiving these benefits in 1982 was 69.4 million.

## Means-Tested Noncash Benefits

Means-tested benefits are those that require that the household's income or assets (resources) fall below specified guidelines in order to qualify for benefits. The market value of these benefits, which are intended for the low-income population, exceeds cash public assistance by more than 2 to 1. In 1982, the market value of these benefits was estimated to be \$51.1 billion.<sup>2</sup>

Between 1981 and 1982, the number of households containing one or more children receiving free or reduced-price school lunches increased by 5 percent to 5.6 million. There was no statistically significant change in the number of households receiving food stamps (7.2 million) or in the number of households residing in public or other subsidized rental housing (3.2 million). The number of households with one or more members covered by Medicaid declined by 5 percent to 8.1 million.

One-half of the households receiving means-tested noncash benefits had incomes below the poverty level in 1982 (table A). This represents an increase over the 1981 figure of 47 percent. Poverty rates increased from 67 to 72 percent for households receiving food stamps, from 49 to 54 percent for households receiving free or

<sup>2</sup>For further details concerning the valuation of noncash benefits, see Technical Paper No. 50, Alternative Methods for Valuing Selected In-Kind Transfer Benefits and Measuring Their Effect on Poverty.

**Table A. Households Receiving Means-Tested Noncash Benefits—Number, Percent Below Poverty Level, and Percent of Poor Receiving Benefits: 1982 and 1981**

(Households as of March of the following year. Households are classified according to poverty status of the family or nonfamily householder)

Type of means-tested benefit	All households			Percent of households below the poverty level			Percent of all poor households receiving noncash benefits		
	Number (thousands)		Percent change	1982	1981	Difference (1982 minus 1981)	1982	1981	Difference (1982 minus 1981)

X Not applicable.

<sup>1</sup>Detail does not add because some households have noncash benefits from more than one source.

<sup>2</sup>Based on poor households with school children 5 to 18 years old.

<sup>3</sup>Based on poor households in renter-occupied housing.

reduced-price school lunches, and from 54 to 59 percent for households with one or more members covered by Medicaid. The poverty rate for households residing in public or other subsidized rental housing was not significantly different in 1982.

Nearly 60 percent of the households below the poverty level received some form of non-cash benefits in 1982, about the same percentage as in 1981. The percentage of poor households receiving food stamps increased from 41 to 43 percent and the percentage with school children receiving free or reduced-price school lunches increased from 63 to 66

percent. The proportion of poor households residing in public or other subsidized rental housing and the proportion covered by Medicaid in 1982 were not significantly different from those in 1981.

The 7.2 million households receiving food stamps during 1982 accounted for 9 percent of all households (table B). The median total money income for these households was \$5,830, or 29 percent of the median income for all households. About 72 percent of all food stamp households had total money incomes below the poverty level in 1982; 83 percent had incomes below 125 percent of the

<sup>1</sup>Includes households not receiving means-tested noncash benefits, not shown separately.

<sup>2</sup>Based on households with school children 5 to 18 years old.

<sup>3</sup>Based on households in renter-occupied housing.

<sup>4</sup>Persons of Spanish origin may be of any race.

poverty level. Although only 9 percent of all households received food stamps, there were several subgroups with much higher rates of food stamp reciprocity. These include households with Black householders (26 percent), those with householders of Spanish origin (19 percent), and family households maintained by women, no husband present (31 percent). The mean annual face value of food stamps received by all food stamp households in 1982 was \$990, an increase of 12 percent over the 1981 mean of \$890.

Free or reduced-price school lunches were received by children in 22 percent of all households with school children aged 5 to 18 years. About 48 percent of households maintained by women (no husband present) with children in school received free or reduced-price school lunches. The South, which contains about 35 percent of all households with school children 5 to 18 years old, accounted

for about 43 percent of the total 5.6 million households receiving free or reduced-price school lunch. Two-thirds of the 4.6 million poverty households with school children received school lunches at a reduced price or for free.

About 11 percent of the 29.4 million renter-occupied households were residing in publicly owned or other subsidized housing in March 1983. Twenty-three percent of the 7.2 million renter-occupied households below the poverty level resided in public or subsidized housing. Thirty percent of the households residing in public or subsidized housing had a householder 65 years old or over.

Of the 8.1 million households with members covered by Medicaid, 4.8 million (about 59 percent) had incomes below the poverty level. The median income for households with Medicaid coverage was \$6,600, or one-third of the median income for all households.

**Table C. Percent Distribution of Means-Tested Noncash Benefit Households, by Selected Characteristics: 1982**

(Households as of March 1983. Households are classified according to the race of the family or nonfamily householder)

Residence in central cities.....	39.8	38.1	52.0	40.6

<sup>1</sup>Persons of Spanish origin may be of any race.

Medicaid covered 39 percent of all poor households, one-half of all poor households with children under 19 years old, and 35 percent of all poor households with a householder 65 years and over. Of all households with Medicaid coverage, 68 percent had a White householder, 29 percent had a Black householder, and 10 percent had a householder of Spanish origin. (See table C.)

#### Public Nonmeans-Tested Noncash Benefits

Households receiving public nonmeans-tested benefits are not required to meet income or asset guidelines. Two major public programs are covered in this report: Medicare and regular-price school lunches. (All school lunches served at schools participating in the National School Lunch Program are subsidized.) During 1982, there was no statistically significant change in the number of households with one or more members covered by Medicare (20.8 million). The number of households with school children receiving regular-price school lunches declined by 9 percent to 10.3 million (table D).

About 25 percent of all households in the United States contained one or more per-

sons covered by Medicare during 1982. Of these, about 82 percent had a householder 65 years old or over. The median income of Medicare households was \$11,760 in 1982. The poverty rate for these households was 17 percent as compared with the 14 percent poverty rate for all households. About 97 percent of all households with an elderly householder (65 years old or over) reported one or more members covered by Medicare.

The 10.3 million households containing one or more children purchasing regular-price school lunches in 1982 represented 39 percent of all households with school children 5 to 18 years old. The median income for these households was \$29,220 in 1982, about 20 percent higher than the median income for all households with school children and about 45 percent higher than the median income for all households.

#### Employer- or Union-Provided Noncash Benefits

Two of the most important employer-provided noncash benefits are pension plans and group health insurance plans. The number of households with one or more workers covered by an employer- or

**Table D. Households Receiving Nonmeans-Tested Noncash Benefits—Number, Median Income, and Percent Below Poverty Level: 1982 and 1981**

(Households as of March of the following year. Households are classified according to the poverty status of the family or nonfamily householder)

\*Significant at the .05 level.

\*\*Significant between the .05 and .10 levels.

<sup>1</sup>For standard errors on median incomes see table 1.

<sup>2</sup>Detail does not add because some households have noncash benefits from more than one source.

<sup>3</sup>Includes only workers with group health insurance plans which were paid for in part (or all) by an employer or union.

union-provided pension plan decreased from 38.1 million in 1981 to 37.5 million in 1982. The number of households with one or more members having a group health

insurance plan paid for, at least in part, by their employer or union (49.0 million) was not significantly different in 1982.

Households in which one or more persons were covered by a pension plan at work during 1982 represented about 45 percent of all households. After excluding households in which the householder was 65 years old or over, this figure rises to 54 percent.

During 1982, households in which one or more members were covered by a group health plan at work that was paid for, in full or in part, by an employer or union represented 58 percent of all households. Of all households with a householder less than age 65, 70 percent had at least one member covered by an employer- or union-provided group health plan.

#### NOTE ON LIMITATIONS OF NONCASH DATA

Although these data on noncash benefits provide needed information on the characteristics of households receiving noncash benefits, caution should be used in interpreting the data, or in using the data to determine whether eligibility rules are being observed. The accounting period and definition of income in the CPS often differ substantially from those used to determine program eligibility for public noncash transfer programs. Also, household composition may differ between the time benefits were received and the time the survey was taken. In addition, the CPS sample universe is limited to the civilian noninstitutional population. This fact should be kept in mind especially when examining the Medicare

and Medicaid data because a significant proportion of persons receiving benefits from these programs are institutionalized. As in all household surveys, the CPS tends to underestimate the number of money income recipients. A preliminary evaluation of the quality of the noncash benefit data indicates that they have underestimation problems similar to those experienced for recipients of public cash transfer programs. For further details concerning the limitations of non-cash benefits data, see Current Population Reports, Series P-60, No. 136.

#### VALUATION OF NONCASH BENEFITS

In March 1982, the Census Bureau released Technical Paper No. 50, Alternative Methods for Valuing Selected In-Kind Transfer Benefits and Measuring Their Effect on Poverty. This technical paper presented estimates of poverty based on both money income and the value of selected noncash benefits. By including the value of noncash benefits the report indicates that the number of poor in 1979 would be reduced by between 12 and 42 percent from the current money income poverty definition.

Estimates of the number of persons below the poverty level for 1982 based on both money income and the value of noncash benefits are not yet available. A report containing these estimates will be available later this year.

2809

## Appendix A. Definitions and Explanations

**Noncash benefits.** Noncash benefits can be defined as benefits received in a form other than money which serve to enhance or improve the economic well-being of the recipient. Data collection in March 1983 concentrated on two major categories of noncash benefits: those which could be categorized as public transfers and those which could be categorized as employer- or union-provided benefits to employees. In the area of public noncash transfers, the following programs were covered: the Food Stamp Program, the National School Lunch Program, public and other subsidized housing, Medicare health insurance, Medicaid health insurance, and CHAMPUS, VA, or military health insurance. For employer- or union-provided noncash benefits, pension plans and group health insurance plans were covered.

**Population coverage.** This report includes the civilian noninstitutional population of the United States (the 50 States and the District of Columbia) and members of the Armed Forces living off post or with their families on post, but excludes all other members of the Armed Forces. The exclusion of the institutional population from the CPS sample universe is an important limitation which should be noted when examining the Medicare and Medicaid data. The exclusion of Puerto Rico from the sample is an important limitation when examining the food stamp data.

**Money income.** Median income figures shown in this report are limited to money income before payment of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions such as union dues or Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income

which was regularly received. Capital gains (or losses) and lump sum or one-time payments such as life insurance settlements are excluded.

**Underreporting.** As in all household surveys, the estimates of the number of noncash benefit recipients, money income recipients, and the total amount of money income derived from the March CPS are, in most cases, somewhat less than comparable estimates derived from independent sources, such as the Bureau of Economic Analysis, Department of Health and Human Services, and Department of Agriculture. The difference between the survey estimate and the independent estimate is generally termed "underreporting." Underreporting tends to be more pronounced for income sources such as public assistance and welfare, unemployment compensation, and property income such as interest, dividends, and net rental income, and less for wages and salaries. For details concerning the reporting of money income, see Current Population Reports, Series P-60, No. 137. For an evaluation of the quality of the noncash benefit data, see Current Population Reports, Series P-60, No. 136.

**Poverty definition.** In this report households are classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits, the most important of which are covered in this report. For estimates of the value of noncash benefits and their effect on the measurement of poverty, see Technical Paper No. 50, Alternative Methods for Valuing Selected Noncash In-Kind Transfer Benefits and Measuring Their Effect on Poverty. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of

families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. Households are classified according to the poverty status of the family or nonfamily householder. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI). The average poverty threshold for a family of four was \$9,862 in 1982, about 6.2 percent higher than the comparable 1981 cutoff of \$9,287. For further details, see Current Population Reports, Series P-60, Nos. 138 and 140.

Household. A household consists of all the persons who occupy a housing unit. A house,

an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Symbols. A dash (-) represents zero or rounds to zero, and the symbol "B" means that the base is less than 75,000. An "X" means not applicable, and "NA" means not available.

## Appendix B. Source and Reliability of Estimates

### SOURCE OF DATA

The estimates are based on data obtained in March 1983 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and over in every sample household. In addition, supplementary questions were asked in March 1983 about money income, non-cash benefits, and work experience for the previous year. In order to obtain more reliable data for the Spanish population, the March CPS sample was enlarged to include all households from the previous November which contained at least one sample person of Spanish origin. For this report, households containing Armed Forces members living off post or family households on post are also included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,148 counties, independent cities, and minor civil divisions in the Nation. In this sample, roughly 60,500 occupied households were eligible for interview each month during the last year.<sup>1</sup> Of this number, each month roughly 2,500 occupied units were visited but not interviewed because the occupants were not found at home after repeated calls or were unavailable for some other reason. For a description of the previous CPS sample designs see the detailed reports in the series, Current Population Reports, Series P-60.

The estimation procedure used in this survey involves the inflation of the weighted sample results to independent estimates of

the total civilian noninstitutional population of the United States by age, race and sex. The estimation procedure also involved a further adjustment so that the husband and wife of a household receive equal weights. These independent estimates are based on statistics from the 1980 Decennial Census; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

### RELIABILITY OF ESTIMATES

Since the CPS estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Sampling variability. The standard errors that may be obtained using this appendix are primarily measures of sampling variability. That is, they are measures of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated

<sup>1</sup>These numbers do not include supplemental Spanish households in the March CPS sample.

standard error were calculated from each sample, then:

1. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
2. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses appearing in this report are 1) the population parameters are identical, versus 2) they are different. An example of this would be comparing the number of households receiving noncash benefits in 1982 with the number of households receiving noncash benefits in 1981. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such

combinations of the categories as serve each user's needs.

Standard errors for data based on CPS. Because of the large number of estimates that are produced from the CPS, it is not feasible to give a standard error for each of the estimates. Instead, the Bureau provides generalized standard error tables and adjustment factors for different types of estimates. These generalized tables may be found in the detailed report for 1981 in this series, Current Population Reports, P-60, No. 136. They will also be contained in the detailed report for 1982, when it is published.

In this advance report, the Bureau provides the formulas and parameters that are used to derive the generalized tables and adjustment factors. Note that standard errors calculated with the formulas will be more accurate than those obtained by adjusting the generalized standard errors.

Standard errors of estimated numbers and estimated percentages. Approximate standard errors of estimated numbers and estimated percentages can be computed using formulas (1) and (2) below, respectively. The formulas are:

$$\sigma_x = \sqrt{ax^2 + bx} \quad (1)$$

where x is the size of the estimate and a and b are the parameters from table B-1 associated with the characteristic; and

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \quad (2)$$

where x is the size of the subclass of the population which is the base of the percentage, p is the percentage (0 < p < 100), and b is the parameter from table B-1 associated with the characteristic in the numerator of the percentage.

Standard error of a difference. The formula for the approximate standard error of the difference between two estimates x and y is given by

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2 - 2\rho\sigma_x\sigma_y} \quad (3)$$

**Table B-1. Parameters for Computation of Standard Errors of Estimated Numbers and Percentages for Households: 1982**

Characteristic	Parameters	
	a	b
<b>HOUSEHOLDS FROM ALL INCOME LEVELS</b>		
Type of residence:		
Metropolitan.....	-0.000010	1721
Nonmetropolitan.....	-0.000015	2582
Region:		
Northeast.....	-0.000010	1704
North Central.....	-0.000010	1755
South.....	-0.000010	1687
West.....	-0.000008	1446
Race and Spanish origin:		
Total or White.....	-0.000010	1721
Black.....	-0.000089	1876
Spanish origin.....	-0.000014	2420
Type of household, age of householder, and tenure....	-0.000010	1721
<b>HOUSEHOLDS BELOW THE POVERTY LEVEL</b>		
Type of residence:		
Metropolitan.....	0.000076	1876
Nonmetropolitan.....	0.000114	2814
Region:		
Northeast.....	0.000075	1857
North Central.....	0.000078	1914
South.....	0.000074	1838
West.....	0.000064	1576
Race and Spanish origin:		
Total, White, or Black....	0.000076	1876
Spanish origin.....	-0.000014	2420
Type of household, age of householder, and tenure....	0.000076	1876

where  $\sigma_x$  and  $\sigma_y$  are the standard errors of the estimates  $x$  and  $y$  and  $\rho$  represents the correlation between  $x$  and  $y$ .

Correlation coefficients ( $\rho$ ) for year-to-year comparisons of income and poverty estimates are presented in table B-2. For other comparisons assume  $\rho$  equals zero. Making this assumption will result in accurate estimates of the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Standard errors of estimated medians. The estimated medians published in this report are accompanied by their estimated standard errors. Thus, it is not necessary for the reader to make any additional computations in order to obtain estimates of standard errors for these statistics.

**Table B-2. Year-to-Year Correlation Coefficients for Income and Poverty Estimates of Households: 1982 and 1981**

Characteristic	Income	Poverty
Total.....	0.35	0.35
White.....	0.35	0.30
Black.....	0.35	0.35
Spanish origin.....	0.55	0.55

Note: These coefficients are based on CPS data obtained in March 1978 and March 1979.
