MONEY INCOME IN 1973 OF FAMILIES AND PERSONS IN THE UNITED STATES

(Advance data on the 1973 income of families and persons were issued in July 1974 in Current Population Reports, Series P-60, No. 93)

Reflecting the inflation in the economy, most of the 8.4 percent increase in median family income ($12,050) from 1972 to 1973 was eroded by rising prices; however, the net gain in real purchasing power was still statistically significant. After adjusting for the 6.2 percent rise in prices during this period, the 1973 median income increased by 2.1 percent over the 1972 median expressed in terms of constant dollars. The data in this report cover the period up through calendar year 1973; thus the report does not reflect the substantially increased inflationary pressures of 1974.

Of the 55.1 million families (including families with civilian or military heads) in the United States as of March 1974, 5.1 million, or 9.3 percent received incomes of $25,000 or more in 1973. There were 14.4 million families (26.2 percent) with incomes between $15,000 and $25,000; 14.1 million families (25.5 percent) with incomes between $10,000 and $15,000; 13.4 million families (24.3 percent) with incomes between $5,000 and $10,000; and 8.1 million families (14.6 percent) with incomes less than $5,000 in 1973.

Both the increase in the number of families and in money income between 1972 and 1973 contributed to the growth in aggregate family income. Aggregate family income increased by 9.2 percent between 1972 and 1973, stemming from a 1.3 percent increase in the number of families (680 thousand net additional families) and a 7.9 percent increase in mean income per family.

Aggregate income in 1973 was found to be distributed among families as follows: The lowest fifth of families, ranked by size of their 1973 income, received 5.5 percent of the aggregate money income of families; the second fifth received 11.9 percent; the third fifth received 17.5 percent; the fourth fifth received 24.0 percent; and the highest fifth received 41.1 percent. The top 5 percent of families received 15.5 percent of the aggregate income while all families below the median family income ($12,050) received 25.5 percent.

Table A. Number of Families and Unrelated Individuals by Total Money Income in 1973

(Families and unrelated individuals as of March 1974)

Total money income	Number of--	
	Families	Unrelated individuals
Total.....	55,053,000	18,260,000
Under $1,000.....	628,000	1,380,000
$1,000 to $1,999.....	965,000	2,608,000
$2,000 to $2,999.....	1,755,000	2,961,000
$3,000 to $3,999.....	2,244,000	1,955,000
$4,000 to $4,999.....	2,491,000	1,695,000
$5,000 to $5,999.....	2,555,000	1,292,000
$6,000 to $6,999.....	2,640,000	1,036,000
$7,000 to $7,999.....	2,709,000	928,000
$8,000 to $8,999.....	2,800,000	864,000
$9,000 to $9,999.....	2,715,000	672,000
$10,000 to $10,999...	3,118,000	1,001,000
$11,000 to $11,999...	2,770,000	
$12,000 to $12,999...	3,100,000	914,000
$13,000 to $13,999...	2,539,000	
$14,000 to $14,999...	2,513,000	
$15,000 to $19,999...	9,438,000	764,000
$20,000 to $24,999...	4,962,000	
$25,000 to $49,999...	4,564,000	133,000
$50,000 and over.....	548,000	58,000
Median income.....	$12,051	$4,134
Mean income.....	$13,622	$5,708

The median income for both black and white families increased during 1973. The increase for black families was 5.9 percent whereas the increase for white families was 9.1 percent. The difference between these rates of growth, however, is not statistically significant. After adjusting for price changes, only the white median income showed a statistically significant rise, increasing 2.6 percent. The median income of black families in 1973 was $7,270 or about 58 percent of the median income of white families of $12,600. The 1973 ratio was not significantly different from the 59 percent for 1972, however, it does continue the downward trend of this ratio from 61 percent in 1970. A discussion of some of the major factors affecting changes in the income ratio of black and white families over

the past seven years is to be found in the section entitled "Changes in the Ratio of Black to White Median Income - Families."

The survey showed that of all persons 14 years old and over, about 92 percent of the men and 69 percent of the women received income in 1973. Men and women who were income recipients had median incomes of $8,060 and $2,800, respectively. The rate of increase between 1972 and 1973 in the medians was about 8 percent for both men and women. The survey also showed that about 81 percent of men and 52 percent of women 14 years old or over worked during 1973 and that about 54 percent of men and 21 percent of women worked year round full time.

Between 1972 and 1973 the median income for men working year round full time increased by 8.8 percent, rising to a level of $11,470. The median income for women working year round full time rose to $6,490, or about 57 percent of the median for comparable men. Although this ratio is not statistically different from the 1972 value, it is about 3 percentage points lower than the 1971 ratio.

These are some of the highlights obtained from the Census Bureau's Current Population Survey (CPS) of March 1974. The survey results cover both the civilian noninstitutional population and an estimated 1,067,000 persons who were members of the Armed Forces living off post or with their families on post in the United States. The 1974 survey shows that there were about 207,949,000 persons, of whom 55,053,000 were family heads, 134,309,000 were other family members, and 18,587,000 were unrelated individuals, i.e., persons living alone or not related to others in the household including those under 14 years old.

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. For further details, see below and page 178.

Data on consumer income collected in the CPS are limited to money income received before payments for personal income taxes and deductions for Social Security, union dues, Medicare premiums, etc. Money income is the sum of amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Underreporting tends to be more pronounced for income sources that are not derived from earnings, such as Social Security, public assistance, and net income from interest, dividends, rentals, etc. Overall, income earned from wages or salary is much better reported than other sources of income and is nearly equal to independently derived estimates of aggregate wage or salary income. By contrast, 1973 CPS income data on Social Security and public assistance payments to beneficiaries are approximately 89 and 75 percent, respectively, of independently derived estimates. (See table A-8.)

SELECTED FAMILY INCOME CHARACTERISTICS

Type of family. In March 1974, about 85 percent of all families were husband-wife families, approximately 3 percent were headed by a male with no wife present, and the remaining 12 percent were headed by a female. The median income in 1973 of all husband-wife families was $13,030. For husband-wife families with wives in the paid labor force the median income was $15,240, or 33 percent higher than the median income for husband-wife families in which the wives were not in the paid labor force.

There were almost five times as many families headed by a female (6.8 million) as there were families headed by a male with no wife present (1.4 million). The median income in 1973 of families headed by a female ($5,800) was slightly more than one half (54 percent) of the median

income of families headed by a male with no wife present. The median income of families headed by a male with no wife present ($10,740) was much closer to the $13,030 median income for husband-wife families than was the median income for families headed by a female.

About 34 percent of all families headed by a female had incomes below $4,000 in 1973, compared with about 14 percent for male heads with no wife present. Approximately 7 percent of the husband-wife families had incomes below $4,000. The reverse order is observed for families with incomes above $15,000--40 percent for husband-wife families, 30 percent for male heads with no wife present, and 9 percent for families headed by a female. (See table B.)

Table B. Families With Incomes Under $4,000 and $15,000 and Over in 1973, by Type of Family

(Families as of March 1974)

Type of family	Total	Families with incomes--	
		Under $4,000	$15,000 and over

Percent.....	100.0	33.6	8.8

Number of earners. The number of earners per family is highly correlated with median family income. The median income for the 7.8 million families with three or more earners was $19,140 in 1973 as compared with medians of $13,800 for the 21.9 million families with two earners and $10,240 for the 19.6 million families with one earner. In 1973, 68.4 percent of the families with three or more earners had incomes above $15,000 while only 42.4 percent for two-earner families and 24.0 percent for one-earner families were above this level. The above proportions reflect an improvement for each of these groups since 1968 when the comparable percentages (expressed in constant 1973 dollars) were 57.3 percent for three-or-more-earner families, 33.9 percent for two-earner families and 18.7 percent for one-earner families. Of families with no earners, 3.8 percent received incomes above $15,000 while 46.0 percent received incomes below $4,000.

Educational attainment of head. There is a strong positive relationship between educational attainment and income. For example, although approximately 10 percent of all families with heads 25 years old and over received incomes of $25,000 or more, nearly one in three families whose head completed 5 or more years of college education had incomes of $25,000 or more while for families whose head had completed 4 years of college, about 24 percent received $25,000 or more. About 8 percent of the families whose heads completed their education at the high school level received $25,000 or more in 1973. (See table 36.) Higher educational attainment of the family head, however, is no guarantee of higher family income. For example, 27.9 percent of families whose head completed 4 years of college received less than the median income ($13,190) for families headed by high school graduates.

Age of head. There is also a strong relationship between the age of the family head and income. Family life cycle studies indicate that income generally increases with age up to a certain age level and then gradually declines in the upper age brackets. The data for 1973 show that the median income of families with a head between 14 and 24 years old was $8,010. (See table 25.) The median increases with age reaching a peak of $15,220 for families with heads in the 45 to 54 age bracket. The age group having the lowest median income ($6,430) is for families whose head was 65 years old and over. Moreover, both the young and old age groups tend to be overrepresented in the lower fifths of families and underrepresented in the upper fifths while the middle age groups reflect the opposite situation, as shown in table 18. Thus, in 1973, 33.4 percent of families with a head between 14 and 24 years of age were in the lowest fifth of all families while 4.2 percent were in the highest fifth. Of families with a head between 45 and 54 years old, 11.3 percent were in the lowest fifth while 31.0

percent were in the highest fifth. Finally, of the families with a head 65 years old and over, 47.5 percent were in the lowest fifth while 8.1 percent were in the highest fifth.

Work experience of head. Although more and more families derive their income through the efforts of both the family head and other family members, in most instances the work experience of the family head is still the principal factor in shaping the level of family income. There were 54.1 million families headed by a civilian, of whom 45.2 million worked at some time during 1973, 34.9 million (or 77 percent) worked 50 to 52 weeks at full-time jobs while 3 percent worked year round at part-time jobs. There were approximately 9.0 million families, 59 percent of which were 65 years or older, in which the head did not work at all during 1973.

The median income of families headed by a year-round full-time worker amounted to $14,610, about twice as much as that of families headed by a year-round part-time worker ($7,320). For families in which the head did not work at all during 1973, the median income was $5,240, or about 36 percent of the median income of families headed by a year-round full-time worker. (See table 42.)

Source of income. Earnings comprise the largest source of family income. In 1973, about 33 percent of all families indicated that their only source of income was from earnings (wages, salaries and/or self-employment income) 56 percent had other types of income in addition to earnings; e.g., interest, dividends, unemployment compensation, and pensions, and the remaining 11 percent indicated they had income only from nonearned sources. (See table 49.)

The median income of families with wages and salaries only, was about $11,870 in 1973, as contrasted with a median of $13,680 for families having both wages or salary and income other than earnings. Families with income solely from unearned sources had a median income of $4,330.

About 45 percent of the families with incomes under $4,000 in 1973 derived all of their income from unearned sources. This proportion was about 7 percent for families in the $7,000 to $10,000 income class interval, and about 1 percent for families at the $25,000 and over level.

Between the income class intervals of $4,000 and $12,000, the proportion of families with income only from earnings rose from 22 percent of all families in the $4,000 to $4,999 category to 43 percent in the $10,000 to $11,999 interval. However, as family income moves into higher income intervals, there are proportionately fewer families which have only earnings. About 33 percent of families in the $15,000 to $24,999 bracket received only earnings, but for families with incomes of $50,000 or more, as few as 17 percent were solely dependent on earnings.

Region. Although the South remains below the non-South[1] in median income, there has been some improvement in recent years. In 1973, the median income for the 17.6 million families living in the South was $10,630, or 83 percent of the $12,750 median income for the 37.4 million families in the non-South. This reflects an improvement for the 5-year period beginning in 1968 when the median income for families in the South was about 81 percent of the $9,160 median for non-South families. In 1973, about 32.0 percent of all families lived in the Southern region of the United States and comprised 40.8 percent of all families in the lowest fifth of income in the United States. The comparable estimates in 1968 were 30.2 percent and 42.1 percent, respectively.

Metropolitan-nonmetropolitan residence. In 1973, the highest family median income ($14,950) was associated with suburban families of large metropolitan areas (population of one million or more), while the lowest median income ($9,740) was associated with farm families located outside metropolitan areas. The median income for the 8.5 million families residing in central cities of large metropolitan areas was approximately 77 percent of the median income for the 12.7 million suburban families of these metropolitan areas. In smaller metropolitan areas (with a population of less than one million), the median income for the 7.5 million central city families was about 88 percent of the $12,850 median income for the 8.6 million suburban families.

The 1973 data also reveal that the median income of families in metropolitan areas was about 25 percent greater than the median income received by families in nonmetropolitan areas--$12,960 versus $10,370; suburban families in larger metropolitan areas had a higher median income (about 16 percent greater) than suburban families in smaller metropolitan areas; and that in nonmetropolitan areas the median income for the 15.7 million nonfarm families ($10,440) was approximately 7 percent higher than the median income for the 2.1 million farm families.

---

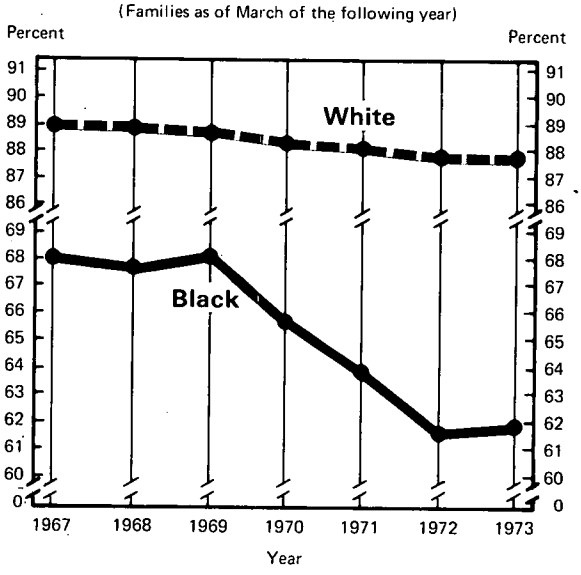
[1]Non-South here refers to the West, Northeast and North Central regions combined.

CHANGES IN THE RATIO OF BLACK TO WHITE MEDIAN INCOME-FAMILIES

As previously mentioned, the 1973 median income for black families was 58 percent of the white median income and this continued a downward trend in this ratio from 61 percent, which occurred in both 1969 and 1970. In contrast to the 1970's, the ratio of black to white median family income had increased during the 1960's. Changes in this ratio reflect many interrelated factors. Among the more important ones influencing the decrease from 1970 to 1973 appear to be differential changes in the proportion of black and white families with multiple earners and work experience patterns of family members. In turn, these factors are largely affected by changes in family composition such as the proportion of husband-wife families with wives in the paid labor force and the proportion of families headed by women. The analysis which follows will examine the changes which have occurred in these variables and indicate how such changes influence the overall ratio of black to white median family income. Reasons for the recent changes are complex, embodying many different socio-economic influences beyond the scope of this report. Therefore, no attempt will be made to explain why the recent changes in family composition have occurred.[2]

The proportion of families with wives in the paid labor force. Changes in this variable can be shown to be the result of changes in: first, the proportion of all families which are husband-wife families, and second, the proportion of all husband-wife families which have working wives. From 1967 to 1969,[3] black husband-wife families as a percent of all black families remained at about the same level (68 percent), but from 1969 to 1973, this proportion declined from 68 to 62 percent. (See figure 2.) From 1969 to 1973, the proportion for their white counterpart declined slightly from 89 to 88 percent. Husband-wife families characteristically have higher median incomes than other types of families, mainly because they are more likely to be multiple earner families. For example, black husband-wife families had a median income of $9,730 in 1973, compared to median incomes of $6,770 for black families headed by a male with no wife present and $4,230 for black families headed by a female. (See table C.) Moreover, the 1973 median income of black husband-wife families was 73 percent of the comparable white median. Therefore, the decline from 1969 to 1973 in the proportion of black husband-wife families, relative to whites, has negatively influenced the median income of all black families which in turn exerted a negative influence on the overall ratio of black to white median family income.

Figure 2. Husband-Wife Families as a Percent of All Families, by Race of Head: 1967 to 1973



The earnings of the wife are an important source of income for many husband-wife families, particularly for black families. In 1973, for example, black wives contributed, on average, 31 percent of family income as compared to 25 percent for their white counterpart. Black husband-wife families with wives in the paid labor force as a percent of all black husband-wife families increased from 50 percent in 1967 to 54 percent in 1970. (See figure 3.) Over the same period, the proportion for their white counterpart increased from 36 to 38 percent; not significantly different from the change experienced by black families. During the 1970-1973 period,

[2]The interested reader should consult: Current Population Reports, Series P-23, No. 50, "Female Family Heads," which offers some explanations for the rise in the total number of female family heads. High divorce and separation rates, the retention of children by unwed mothers, more economic independence resulting from increased labor force participation, and the availability of public assistance programs are a few of the explanations cited.

[3]All years listed here refer to income years. Families are as of March of the following year. Many of the comparisons in this section begin with 1967 since this was the first year that detailed data for black and white families separately were tabulated from the Current Population Survey. An iteration of some of the tables for blacks was run for 1964 through 1966 and this data has been used for certain topics.

Table C. Percent Distribution and Median Income in 1967 to 1973 for Families, by Type of Family and Race of Head

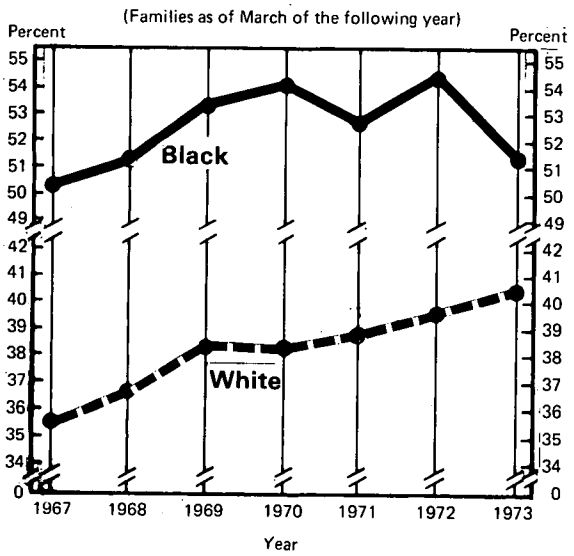
fluctuations in the number of black husband-wife families with wives in the paid labor force as a percent of all black husband-wife families were obscured by sampling variability and this proportion only showed a significant year to year change from 1972 to 1973, when it declined from 54.3 to 51.5 percent. The proportion for their white counterpart during the 1970-1973 period increased from 38 to 41 percent. The median income of black husband-wife families with wives in the paid labor force was $12,270 in 1973, or 78 percent of the comparable white median income and up from 71 percent in 1967. This relative improvement for black husband-wife families with wives in the paid labor force has been a positive influence on the overall ratio of black to white median family income. However, the greater increase in the proportion of husband-wife families with wives in the paid labor force for their white counterpart from 1970 to 1973 has had a counterbalancing negative influence.

Figure 3. Husband-Wife Families with Wives in the Paid Labor Force as a Percent of All Husband-Wife Families, by Race of Head: 1967 to 1973



The combined effect of changes in the proportion of husband-wife families and the percentage of these families with wives in the paid labor force has strongly influenced the overall ratio of black to white median family income. Black husband-wife families with wives in the paid labor force as a percent of all black families decreased from 36 percent in 1969 to 32 percent in 1973 while over the same period the proportion for their white counterpart continued to increase from 34 to 36 percent. (See figure 4.) By 1972, the percentage for whites (35 percent) was larger than the percentage for blacks (33 percent), thus indicating a prior crossover point; the difference in the respective percentages for 1971 was not statistically significant. Referring to figures 4 and 5, it is striking how closely the movements in the ratio of black to white median family income parallel the shifts in the percentage of black husband-wife families with wives in the paid labor force.[4]

---

[4] A regression was run to determine the effect of changes in the proportion of working wives in black and white families on the overall ratio of black to white median family income. A stepwise regression model was used with the overall ratio of black to white median family income as the dependent variable and two independent variables:

X_1 = the proportion of all white families which were husband-wife families with wives in the paid labor force.

X_2 = the proportion of all black families which were husband-wife families with wives in the paid labor force.

Only ten observations were available—one for each year from 1964 onward—since detailed data for black families were not tabulated from the Current Population Survey prior to 1964. The base population for the X_1 variable in 1964 and 1965 was white families plus families in which the head was neither white nor black since detailed data for white families separately were not available in these years. The results of the regression were:

VARIABLE	COEFFICIENT	STANDARD ERROR	T VALUE
CONSTANT	-.1035	.1220	-.85
X_1	.8424	.1461	5.76
X_2	1.2186	.3126	3.90

F-statistic = 21.75, Durbin-Watson Test = 1.91, R^2 = .86, Number of observations = 10.

Thus, changes in the proportion of all families which were husband-wife families with wives in the paid labor force for whites and blacks "explained" 86 percent of the variation in the black to white median family income ratio from 1964 to 1973. The results must be interpreted with caution however, because of the limited number of observations.

Figure 4. Husband-Wife Families with Wives in the Paid Labor Force as a Percent of All Families, by Race of Head: 1967 to 1973

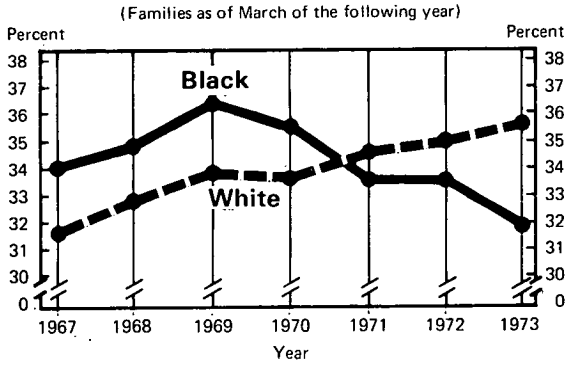


Figure 5. Black Median Family Income as a Percent of White Median Family Income: 1967 to 1973

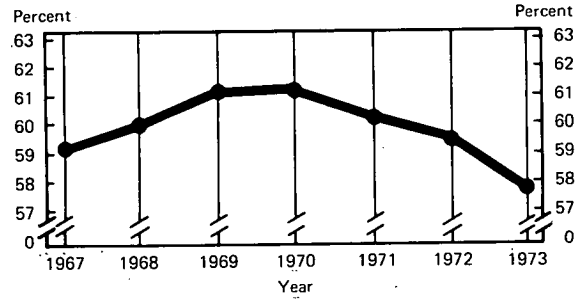
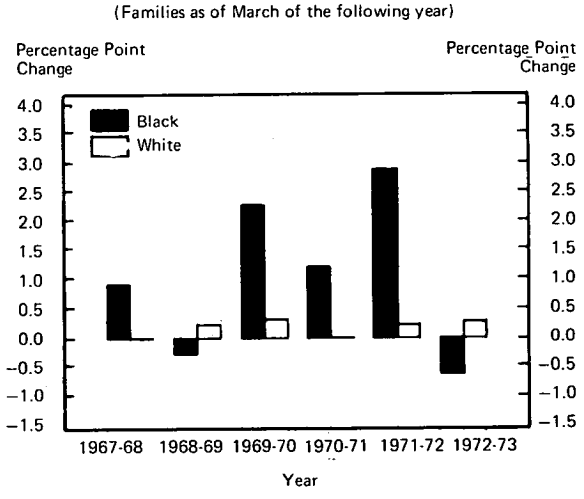


The proportion of families headed by women. Related to the decrease in the proportion of black husband-wife families has been a concomitant increase in the proportion of black families with a female head. Between 1969 and 1973-- the period when the ratio of black to white median family income declined--the proportion of black families with a female head increased from 28 to 34 percent compared to an increase from 9 to 10 percent for whites; a difference of about 5 percentage points between the increases of black and white female heads. (See figure 6.) The data indicate large increases for black female heads in the 14 to 34 age group, from 30 percent in 1969 to 39 percent in 1973; the proportion for black females in the 35 and over age group showed a much smaller increase, from 27 to 31 percent.

For the 1969 to 1973 period, there is the seemingly contradictory evidence that the ratio of black to white median family income did not show a statistically significant change for either families headed by a female (61 to 64 percent) or families headed by a male (71 to 72 percent) and yet the ratio declined for all families. The answer lies in changes in the proportion of families headed by males and females and the difference in average income received by these families. Families headed by a female generally receive less income than families headed by a male. In 1973, for example, the median income of black families with a female head was 44 percent of the median income for black families with a male head while the percentage for white females was 50 percent. Thus, the proportionately greater increase in the number of black families headed by a female vis-à-vis white female heads has reinforced the tendency to lower the ratio of overall black to white median family income.

Figure 6. Year-to-Year Changes in the Percentage of Black and White Families with Female Heads: 1967 to 1973

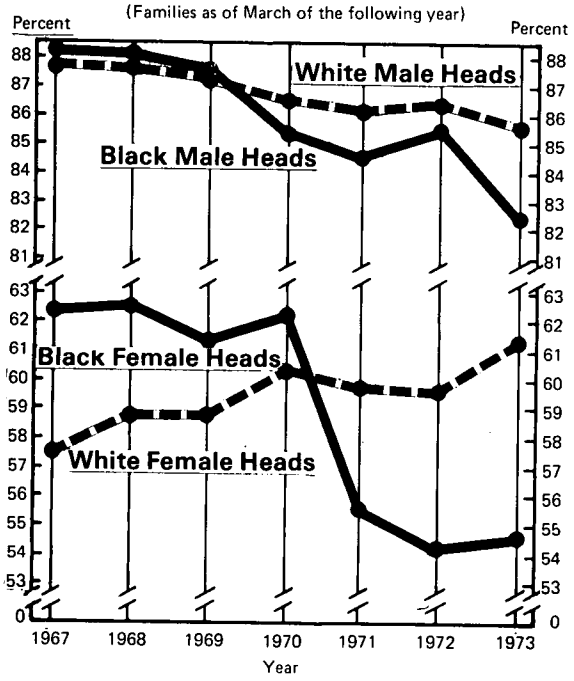


The discussion in the preceding two sections has suggested that changes in family composition have been instrumental in the decline of the ratio of overall black to white median family income. Changes in family composition due to divorce and separation are likely related to changes in family income in the previous period, the current and past employment situation of the family members, the availability of public assistance programs, and a multitude of social and demographic factors. These influences, however, cannot be adequately addressed without the availability of longitudinal data which allow particular families to be analyzed over time.

Work experience of the family head. In addition to changes in family composition, there has been a decided shift in work experience patterns between black and white family heads. Of black families with a female head, the proportion in which the

head worked the previous year declined from 62 percent in 1967 to 55 percent in 1973. In contrast, this proportion for their white female counterpart increased from 58 percent in 1967 to 61 percent in 1973. Thus, a crossover point occurs in 1971, where the proportion of 60 percent for white female heads exceeds the proportion of 56 percent for black female heads. (See figure 7.)

Figure 7. Families with Heads Who Worked the Previous Year as a Percent of All Families, by Sex and Race of Head: 1967 to 1973

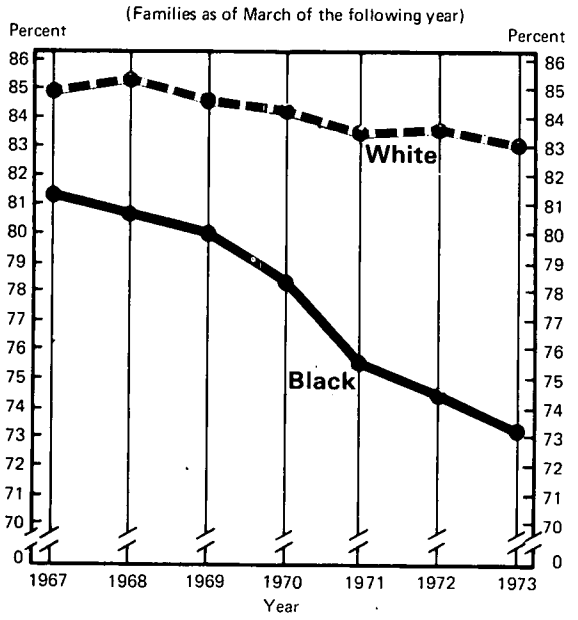


Of families headed by a male, the proportion in which the head worked the previous year declined for both blacks and whites from 1967 to 1973. The decline in this proportion for black male heads was from 88 to 83 percent whereas the decline for white male heads was from 88 to 86 percent. The larger decline in this proportion for black male heads occurred primarily after 1969.[5] (See figure 7.)

[5]It should not be inferred that the changes experienced by both white and black heads of families are the result of voluntary choices. These changes may be caused by external factors such as the overall state of the economy and differential rates of unemployment between whites and blacks; however, an adequate analysis of such relationships is beyond the scope of this text.

The above changes in work experience patterns for male and female heads are reflected in the proportion of black families with heads who worked the previous year as a percent of all black families and similarly for white families. White families with heads who worked the previous year as a percent of all white families declined from 85 percent in 1967 to 83 percent in 1973 while for comparable black families, the decline was from 81 to 73 percent. (See figure 8.) However, the larger decline in this proportion for black families is partially due to the large increase - relative to whites - in the percent of black families with a female head since proportionately fewer female heads worked the previous year than male heads.

Figure 8. Families with Heads Who Worked the Previous Year as a Percent of All Families, by Race of Head: 1967 to 1973



As one would expect, families with heads who worked the previous year have higher median incomes than families with heads who did not work the previous year. For example, black families with heads who worked the previous year had a median income of $9,000 in 1973 compared to $3,610 for those in which the family head did not work the previous year. Comparable white families had respective median incomes of $13,810 and $5,630. Therefore, the relatively larger decline from 1967 to 1973 in the proportion of black families with heads who worked the previous year than for their white counterparts has had a negative influence on the overall ratio of black to white median family income.

Number of earners per family. The above changes in family composition from 1967 to 1973 are largely responsible for changes in the proportion of multiple earner families. This occurs because the majority of multiple earner families, black or white, are two earner families. (See table D.) Additionally, most two earner families are husband-wife families in which both the husband and wife were the earners; in 1969[6] for example, this proportion was 82 percent for whites and 88 percent for blacks. We have already seen that the proportion of black husband-wife families with wives in the paid labor force as a percent of all black families decreased from 36 percent in 1969 to 32 percent in 1973. Consequently, this decline will tend to manifest itself as a decline in the proportion of black multiple earner families. Conversely, the increase in this proportion from 34 to 36 percent for whites will tend to manifest itself as an increase in the proportion of white multiple earner families.

Historically, black families have had a greater proportion of multiple earners than white families. However, from 1967 to 1973, the proportion of black families with multiple earners as a percent of all black families declined from 58 to 50 percent, whereas the proportion for the white counterpart increased from 52 to 54 percent. (See table D.) There was a rapid decline in this proportion for black families between 1969 and 1971 which resulted in a crossover point between these years. (See figure 9.)

Associated with the declining proportion of black families with multiple earners and working heads has been an increase in the proportion of

[6] 1970 Census of Population, Sources and Structure of Family Income (PC(2)-8A), table 1, U.S. Department of Commerce, Bureau of the Census.

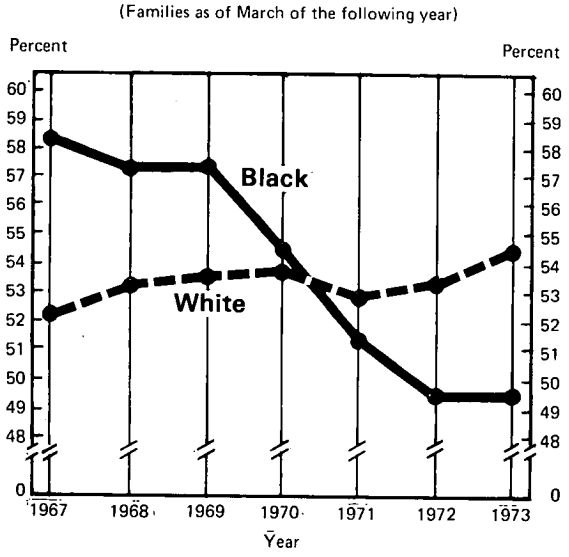
Figure 9. Families with Multiple Earners as a Percent of All Families, by Race of Head: 1967 to 1973



black families with one and no earners. The proportion of black families with one earner increased from 32 percent in 1967 to 35 percent in 1973. Over the same period, the proportion for the white counterpart decreased from 40 to 36 percent. In addition, the proportion of black families with no earner increased from 10 percent in 1967 to 15 percent in 1973 compared to a smaller increase for comparable white families from 8 to 10 percent. The net effect of these changes is summarized by the average number of earners per family which declined for black families from 1.76 in 1967 to 1.55 in 1973. (See table D.) In contrast, the average for white families was 1.68 in 1973, not significantly different from 1967.

The decline in the proportion of black families with multiple earners has had a particularly strong effect on the overall black median family income because these families characteristically have much higher incomes than black families with one or no earners. In 1973, the median income of black families with multiple earners was $11,220 compared to medians of $5,730 for black families

Table E. Median Income in 1967 to 1973 of Families, by Number of Earners and Race of Head

(In current dollars)

Number of earners and race of head	1973	1972	1971	1970	1969	1968	1967

2 earners	10,868	10,053	9,041	8,430	7,782	7,181	6,275
3 earners	11,739	12,716	10,437	10,000	9,027	7,891	6,957
4 earners or more	14,225	13,263	11,191	11,112	11,259	9,360	7,680
RATIO OF NEGRO FAMILIES TO WHITE FAMILIES							
All families	0.58	0.59	0.60	0.61	0.61	0.60	0.59
No earners	0.66	0.65	0.68	0.64	0.68	0.78	0.79
1 earner	0.53	0.55	0.58	0.56	0.52	0.54	0.51
2 earners or more	0.73	0.76	0.73	0.72	0.70	0.69	0.65
2 earners	0.77	0.77	0.76	0.74	0.71	0.72	0.68
3 earners	0.63	0.73	0.67	0.68	0.65	0.62	0.60
4 earners or more	0.66	0.66	0.61	0.64	0.69	0.64	0.56

with one earner and $3,010 for black families with no earners. The median income for all black families in 1973 was $7,270. About 75 percent of the families with multiple earners had incomes greater than this amount, whereas 74 percent of the families with one or no earners had incomes below this figure. Hence, a change in a family's earner status from two or more earners to one or no earners is likely to move the family from above to below the overall median, thus producing a downward pressure on the median.

CHANGES IN THE RATIO OF BLACK TO WHITE MEDIAN INCOME-PERSONS

The importance of changes in family composition on the overall ratio of black to white median family income from 1967 to 1973 is emphasized by examining the relative income positions of black and white persons over the same period. By concentrating on data for persons, it is possible to focus on changes which affect individuals rather than a composite such as families, which is subject to changes in composition over time. In contrast to the changes in income experienced by black families, the ratio of black to white median income for persons has increased from 1967 to 1973.

The ratio of black to white median income increased for both male and female persons from 1967 to 1973. (See table F.) The 1973 median income of $5,110 for black male persons was 60 percent of the median income for white males, up from 57 percent in 1967. Black female persons had a median income of $2,550 in 1973, or 90 percent of the median income for white females compared to a ratio of 78 percent in 1967. From 1970 to 1973, this ratio for females maintained an average level of about 91 percent. (See figure 10.)

As shown in table F, there was also an increase in the ratio of black to white median income from 1967 to 1973 for male and female persons who worked year round full time. Black male persons who worked year round full time

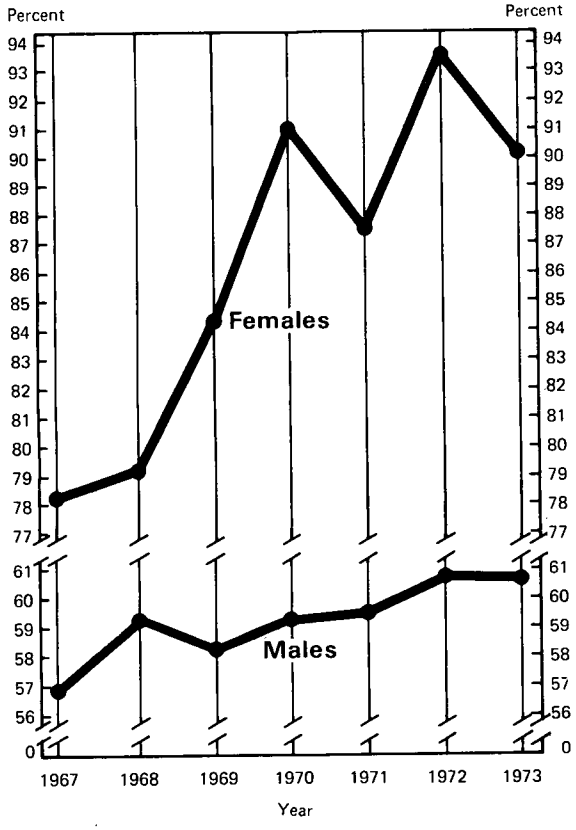
Figure 10. Black Median Income as a Percent of White Median Income for Persons, by Sex: 1967 to 1973



had a median income of $7,950 in 1973, or 67 percent of the median income for comparable white male persons, up from 64 percent in 1967. The median income of $5,600 for black female persons who worked year round full time in 1973 was 85 percent of the median income for comparable white female persons. This ratio had increased from 74 percent in 1967 to 88 percent in 1971; the apparent decrease to 85 percent in 1973 was not statistically significant.

Changes in the income of female persons. The large increase from 1967 to 1973 in the ratio of black to white median income of female persons is largely the result of increased earnings for black females. The ratio of black to white median earnings for females increased from 66 percent in 1967 to 92 percent in 1973. This ratio increased for full-time workers (from 68 to 83 percent) including those who worked year round full time (from 75 to 85 percent); however, the difference in the increase between these two groups was not statistically significant. Changes in the ratio for part-time workers did not establish a definite trend during the 1967 to 1973 period.[7] (See table G.)

The sharper increase in the ratio of black to white median earnings for all females with earnings, as shown above, is consistent with changes in the labor force patterns of working females. For example, of black females with earnings, the proportion who worked year round full time increased from 41 percent in 1967 to 45 percent in 1973. Over the same period, the proportion for their white counterpart decreased slightly from 42 to 41 percent. Of white females with earnings, the proportion who worked part time increased from 28 percent in 1967 to 33 percent in 1973. The proportion for their black counterpart showed some evidence of an increase from 28 percent in 1967 to 30 percent in 1971, but then declined to 27 percent in 1973. Because of the substantial differences in earnings received by year-round full-time compared to part-time workers, one would expect these changes in work experience patterns to increase black female earnings relative to whites.

Although there have been large gains in earnings for black females who worked, the proportion of all black females with income who worked the previous year declined from 77 percent in 1967 to 70 percent in 1973. (See tables F and G.) In contrast, the proportion of white females with income who worked the previous year was 73 percent in 1973, about the same as in 1967. It is likely that the large decline in this proportion for black females is related to the increase in the proportion of black females who were heads of families. From 1967 to 1973, this proportion increased from 23 to 28 percent for black females while the proportion for white females did not show a significant change. It was shown earlier in the section on families that the proportion of black female heads of families who worked the previous year declined sharply from 1967 to 1973. The effect of such changes on the overall ratio of black to white median income for females would depend upon whether or not these females are receiving more income now as heads of families than they were receiving in their previous family relationship status.

---

[7] An adequate treatment of the factors behind the large gains in income for black females who worked - relative to whites - is beyond the scope of this text. Possible factors include shifts in occupational distribution both within and between occupations, changes in educational levels and commitment to the labor force.

[1]The total includes a small number of persons who had earnings but did not work in that year.

Changes in the income of male persons. During the period from 1967 to 1973, the gain in income for black male persons relative to white males (57 to 60 percent) was modest compared to the gain realized by black females. The main reason for the gain by black males also appears to be increased earnings, but this increase has been more gradual than for black females.

The ratio of black to white median earnings for males increased from 58 percent in 1967 to 64 percent in 1973. Over the same period, the ratio of black to white median earnings for males who worked full time increased from 61 to 65 percent, not significantly different from the change experienced by all males with earnings. From 1967 to 1973, changes in the ratio of black to white median earnings for males who worked part time were obscured by sampling variability due to the small size of this group. (See table G.)

There has been little difference in the change of labor force patterns between black and white males who worked. The proportion of black males with earnings who worked year round full time decreased from 59 percent in 1967 to 56 percent in 1971, but then rose back to 59 percent in 1973. During the same time period, changes in this proportion for comparable white males were not significantly different from the changes experienced by black males. (See table G.) From 1967 to 1973, the proportion of white males with earnings who worked part time increased from 12 to 14 percent. Over the same time period, this proportion for comparable black males did not show a statistically significant change.

Although gains in earnings have been made by working black males, the proportion of black males with income who worked declined from 89 percent in 1967 to 85 percent in 1973. Over the same period, this proportion for comparable white males declined from 88.5 to 87.4 percent. However, the larger decline in this proportion for black males may not necessarily have lowered the ratio of black to white median income for males. Changes in the proportion of males who worked are partially explained by large changes in the proportion of males with income in the younger age groups.

The proportion of black males with income in the 14 to 19 years old age group (which comprises about 12 percent of all black males with income) declined from 52 percent in 1967 to 40 percent in 1972, then rose to 47 percent in 1973. In contrast, the proportion for their white counterpart increased from 61 percent in 1967 to 64 percent in 1973. Since persons without income are excluded from the calculation of median income, the large decline in the proportion of black males with income in the 14 to 19 years old age group may have actually been a positive influence on the overall ratio of black to white median income for males.[8] This could occur since the average income of persons in the 14 to 19 years old age group is much lower than for any other age group. A decrease in the proportion of this age group with income is likely to exert an upward pressure on the median income.

RELATED REPORTS

Current Population Survey. Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 96. A cross reference of tables contained in this report with comparable tables included in other reports in the P-60 Series can be obtained by writing to Meyer Zitter, Chief, Population Division, Bureau of the Census, Washington, D.C. 20233. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the Special Labor Force Reports of the Bureau of Labor Statistics. Series P-23, No. 39 "Differences Between Incomes of White and Negro Families by Work Experience of Wife and Region: 1970, 1969, and 1959" contains data comparable to tables 73 to 76 and 79 included in this report. Series P-60, No. 93, "Money Income in 1973 of Families and Persons in the United States" contains advance 1973 income data cross-classified by various characteristics. Series P-60, No. 96 "Household Money Income in 1973 and Selected Social and Economic Characteristics of Households" contains 1973 income data on households. For a detailed analysis of the low income population in 1972, in the United States, see Series P-60, No. 91. Series P-60, No. 94 contains advance data on the low income population in 1973.

Projections of money income size distributions have been prepared from the Current Population Survey and appear in Series P-23, No. 47 "Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals."

---

[8] The standard procedure of excluding persons with no income from the calculation of median income creates the paradox that the median for the group may improve while the general welfare of the group has worsened.

Projections have been prepared for families and unrelated individuals by age of the family head or of the individual in 1971 constant dollars for the following years: 1975, 1980, 1985, and 1990.

Data on the educational attainment and income of men have been assembled from information collected in the Current Population Survey. These data appear in Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years, 1956 to 1972." Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Decennial censuses. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in 1970 Census of Population, Vol. I, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, Sources and Structures of Family Income; 8B, Earnings by Occupation and Education; and 8C, Income of the Farm-Related Population. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the 1970 Census of Housing. Reports of the 1960, 1950, and 1940 Censuses also contain various statistics on income.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the black population and the population of Spanish origin.

Statistics on income in 1969 collected in the Current Population Survey (CPS) of March 1970 differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances. In the first place, the CPS data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self enumerated in the 1970 Census. Moreover, income data in the CPS are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within four of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median family income reported in the 1970 census was about $9,590, 1.7 percent above the comparable figure of $9,433 derived from the March 1970 Current Population Survey. This difference is smaller than the difference of 4.5 percent between the medians compiled from the 1960 census and the March 1960 Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsuo Ono, published in the American Statistical Association Proceedings of the Social Statistics Section, 1972.

NOTE: DATA FOR 1959 THROUGH 1973 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1947 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 169 OF THE APPENDIX. PLEASE NOTE THAT THESE DATA HAVE BEEN REVISED AND ARE NOT COMPARABLE WITH THOSE SHOWN IN PREVIOUS P-60 SERIES REPORTS.

Table 23. INCOME AT SELECTED POSITIONS AND PERCENTAGE SHARE OF AGGREGATE INCOME IN 1953 TO 1973, RECEIVED BY EACH FIFTH AND TOP 5 PERCENT OF FAMILIES, BY REGIONS

(In current dollars)

REGION	INCOME AT SELECTED POSITIONS					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLLARS)
	UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT	
	LOWEST	SECOND	MIDDLE	FOURTH

NOTE: DATA FOR 1959 THROUGH 1973 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1953 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 169 OF THE APPENDIX. PLEASE NOTE THAT THESE DATA HAVE BEEN REVISED AND ARE NOT COMPARABLE WITH THOSE SHOWN IN PREVIOUS P-60 SERIES REPORTS.

Table 24. TYPE OF RESIDENCE AND RACE—FAMILIES AND UNRELATED INDIVIDUALS BY TOTAL MONEY INCOME IN 1973

(Families and unrelated individuals as of March 1974. This report excludes inmates of institutions. It includes members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces; the 1974 survey includes about 1,067,000 members)

APPENDIX

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 1,067,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm. However, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

For detailed information on the effect of the above definitional change, see Series P-60, No. 35, pages 10 and 11.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

The figures shown in this report for standard metropolitan statistical areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's defined on the basis of the 1960 census. The median income in 1969 of families residing in metropolitan areas based on the 1970 definitions and procedures is 0.5 percent lower than that based on the 1960 definitions and procedures. This difference arises partly as a result of the inclusion of new and smaller SMSA's with lower income relative to previously defined SMSA's. The median incomes of men and women were 0.3 percent and 1.5 percent lower, respectively, based on the 1970 census definitions relative to those based on the 1960 census definitions.

Central cities. The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

   a. The additional city or cities have at least 250,000 inhabitants.

   b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Mississippi, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Arizona, Colorado, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Alaska, and Hawaii.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) dividends, interest (on savings or bonds), income from estates or trusts, or net rental income; (6) public assistance or welfare payments; (7) unemployment and workmen's compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 was coded as $15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Overall aggregate income compiled in the CPS was about 90 percent of independently derived estimates in 1973. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc. For further details, see page178 of this report.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not

State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties, include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Public assistance or welfare payments include public assistance payments such as old age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (in cluding members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings--the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment; and

Income other than earnings--the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under $1,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment,

income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The median incomes as shown in this report are calculated from the corresponding income size distributions by linear interpolation within the income interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median. Thus, the median family incomes greater than $10,000 as shown in tables 26 and 74 differ from corresponding medians shown in tables 24 and 27, respectively, because of interpolation differences. For example, median family income for all families as shown in table 26 is $12,044 or 0.1 percent lower than the comparable median of $12,051 as shown in table 24. The median for white families as shown in table 74 is $12,525, 0.6 percent lower than the comparable median of $12,595 as shown in table 24.

In general, the median income values are calculated based on the intervals in the table which contains the medians, with the exception of certain tables. The medians for 1973 shown in tables 9 through 23 are based on the intervals shown in table 24, while the medians presented in tables 51, 65, 68, and 69 are based on the intervals shown in table 52. The medians shown in table 74 are based on the intervals shown in table 26.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, hospitals, homes for nurses, convents, monasteries, and ships.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals. The term "primary family" refers to the head of a household and all other persons in the household related to

the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual. A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Married couple. A "married couple" is a husband and his wife enumerated as members of the same household or group quarters. In table 54 the category "married couples 62 years old and over" includes all couples of which either member is 62 years old and over. In the P-20 reports on Household and Family Characteristics married couples are classified by the age of the husband only.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation, class of worker, and employment status in tables 41, 59, 68, 69, 76, and 79, refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, class of worker, and industry in tables 40, 45 to 47, and 64 to 67 refer to the job held longest during the income year.

In several tables two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession, or trade, for profit or fees. Included in the self-employed groups in these tables are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings included in the income reports beginning with 1971 were based on the classification systems used in the 1970 Census of Population. These groupings, with minor differences in the group titles, were also used in the 1970 income report containing data compiled from the March 1971 survey. Between the 1970 and 1969 income reports which included data obtained from the March 1971 and March 1970 surveys, respectively, there were changes in the industry and occupation classification systems. The income reports from 1961 through 1969 utilized the 1960 census classification systems. However, beginning with the 1970 income reports, the 1970 census systems were used. For major groupings, especially for the industrial groupings, there is relatively little difference in comparability between the systems used in the 1960 and 1970 Censuses of Population. A detailed comparison of these two systems can be found in the Bureau of the Census Technical Paper 26, 1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements. Additional information may be obtained from a paper, "Changes Between the 1960 and 1970 Census of Population" by Stanley Greene and John Priebe presented at the August 1972 American Statistical Association meeting held in Montreal, Canada. Also see "Revisions in Occupational Classifications for 1971" by John E. Bregger in Employment and Earnings, Volume 17, No. 8, page 5, published by the Bureau of Labor Statistics, United States Department of Labor.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "crafts").

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. An estimate of the size of the base (number of units) of each percent distribution by income in 1973 is shown in most of the tables in this report. The base figures shown in this report for 1971 to 1973 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census. A more detailed description of this change can be found in an article entitled "Revisions in Current Population Survey" Employment and Earnings, Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

Computation of aggregate income by fifths. In calculating aggregate income by fifths (or for the top 5 percent), from 1958 to the present, the following procedure was followed:

1. Rank the number of units (families or unrelated individuals as applicable) by size of total money income.

2. Determine the income cutoffs for each fifth (and top 5 percent by summing the units in order from the unit with the lowest income to the unit with the highest income up to and including the unit which just causes the sum of units to equal the number of units below the relevant percentile; and selecting as the upper income cutoff for this percentile the unit which causes the sum of units to equal the number of units below the relevant percentile.

3. Determine the aggregate income in a particular fifth by summing the aggregate incomes of all units corresponding to those units included below the percentile cutoff as determined in step 2 and subtracting the aggregate income for the units in the next lower percentile. The aggregate income for the top 5 percent was determined by subtracting the aggregate income of all units below the ninety-fifth percentile from the total aggregate income for all units.

4. And, finally, calculate the percent distribution of aggregate income.

In calculating the aggregate income by fifths and the top 5 percent for 1958 and all previous years (data for 1958 was calculated both ways), the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For income intervals below $15,000, the midpoint of each class interval was used. (Note: Before calculating the aggregate income distributions, all income intervals below $15,000 which were greater than $1,000 in width were split into $1,000 intervals by interpolation assuming that incomes within the wider interval were distributed according to a Pareto distribution. The midpoints were then calculated based on these smaller income intervals.) A value of $19,000 was used for the $15,000 to $24,999 interval. For the $25,000 and over interval, the estimate of the mean was calculated based on a Pareto Curve fitted to the number of units in the $15,000 to $24,999 interval.

The upper income level of a particular fifth of units ranked by income was estimated by cumulating the number of units in successive income intervals and by interpolating linearly within the income interval in which the fifth falls (designated the reference interval). After determining the upper income level for this fifth, the aggregate income below this income level was estimated by multiplying the midpoint for the interval between the upper income level of the fifth and the lower income level of the reference interval for this fifth by the number of units within this segment and adding the result obtained to the total aggregate income below the reference interval. The aggregate income for a particular fifth was determined as a residual by subtracting the aggregate income below the next lower fifth from the aggregate income below the particular fifth.

For a more detailed description of the method of computing aggregate income by fifths, for 1947 through 1958, see Technical Paper No. 8, Trends in the Income of Families and Persons in the United States: 1947 to 1960, pages 16 to 26, or its revision, Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964.

The following assumptions were used in the above procedures for 1947 through 1958:

1. In subdividing the income intervals below $15,000, the interpolation was made using a Pareto estimation technique.

2. In estimating the mean income per income interval, midpoints and the Pareto estimation techniques were used.

3. In finding the upper levels of each fifth, a linear interpolation technique was used, and

4. In obtaining the mean income of the subinterval between the upper level of the fifth and the lower level of the reference interval, midpoints were used as a proxy for mean income.

Computation of constant-dollar distributions. The adjustment for price change was made by converting the income distribution for families and unrelated individuals for each year (1947 through 1972) into 1973 dollars on the basis of the change in the Consumer Price Index. The first step required the subdivision of broad income intervals, such as $7,000 to $9,999 and $10,000 to $11,999, into smaller intervals to provide a more refined basis for interpolation to convert to constant dollars. This subdivision was accomplished from generalized tables that were prepared from Pareto Curves that were fitted to frequency distributions having varying degrees of concentration in the open-end limits.

After the detailed frequency distributions were obtained, the procedure was then to convert the limits of each income interval into 1973 dollars adjusted by a factor representing the change on the basis of that year's price index (1973 = 100); next, to compute by interpolation the number of families and unrelated individuals in each of the detailed class intervals; and then to combine the estimates into broad income brackets.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices have not been developed for families in different income class intervals. Neither did the available data permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data cover also family savings and income tax payments. For these and other reasons, the constant-dollar figures, particularly in the income range over $10,000, are to be regarded as approximations.

The constant-dollar distributions in table 12 were obtained by applying the same procedures as used for the Country as a whole to the current-dollar family income for each region. Previous studies indicated that regional price indices differed only slightly from the U.S. Index. The limitations noted earlier for the United States distributions in terms of constant dollars apply also to the regional distributions. It should also be noted that the adjustments for price change have been introduced in order to measure changes in real incomes within a region over time, and that they have limited use for the purpose of interregional comparisons. The available consumer price indices measure the relative change in price levels in each region and make possible a comparison of the relative changes of constant-dollar income between regions. These indices do not, however, reflect geographical differentials in price levels and do not, therefore, make it possible to compare the absolute levels of constant-dollar income between regions.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Social and Economic Statistics Administration of the Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition. The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind

account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data. The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 98 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. Population coverage. The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. Average income. The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based

on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Surveys of Consumer Finances. The Survey of Consumer Finances, which was conducted annually through 1971 by the Survey Research Center of the University of Michigan, provided, among other data, information on the size distribution of income. These Surveys were based on nationwide samples that covered all persons in private households. Several important differences between the Survey of Consumer Finances and the present report may be noted:

1. The income-receiving unit in the Survey of Consumer Finances was the family unit, including two or more people living in the same dwelling unit and related to each other by blood, marriage, or adoption or a single person living alone or unrelated to the other occupants in the dwelling unit. However, the data included in the Current Populatiion Report, P-60 series, relate to persons 14 years old and over and to families and unrelated individuals, separately.

2. The Survey of Consumer Finances estimates were based on a sample which was different from and also smaller (approximately 2,600 family units in 1970 and 1,300 in 1971) than the CPS sample. Differences between the results are subject to sampling variability arising from each survey. This factor alone could account for some discrepancies between the two sets of data.

3. There are some differences in the estimating procedure. The Bureau of the Census inflated its weighted sample results to agree with independent estimates of the civilian population of the United States by age, race, and sex, whereas the Survey of Consumer Finances weighted sample results were inflated to agree with independent estimates of occupied dwelling units.

4. Only eight income questions are asked for each person in the Bureau of the Census sample whereas numerous detailed questions on income and other financial items are asked of the head of the spending unit and all other members in the spending unit in each household in the Survey of Consumer Finance sample.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $2,050 (less than $2,800 if 65 years old or over) and married couples receiving less than $2,880 ($3,550 if one spouse is 65 years old or over; $4,300 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of $10,800 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained in the March 1974 Current Population Survey of the Bureau of the Census. The sample was spread over 461 areas comprising 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 47,000 occupied households were eligible for interview each month. Of this number 2,000 occupied units, on the average, were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. In addition to the 47,000 there were also about 8,000 sample units which were visited but were found to be vacant or otherwise not to be interviewed.

The estimating procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that all members of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of certain response and enumeration errors, but it does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables A-1, A-2, A-3, A-4, A-5, and A-6 are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Tables A-1 and A-2 show the standard errors of the estimated numbers of total or white families and persons in a given category. Tables A-3 and A-4 show the standard errors of the estimated numbers of families and persons of Negro and other races in a given category.

Table A-1. Standard Errors of Estimated Numbers of All Families and White Families

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	5,000.....	66
250.....	16	10,000.....	88
500.....	22	25,000.....	112
1,000.....	31	50,000.....	158
2,500.....	48		

Table A-2. Standard Errors of Estimated Numbers of All Persons and White Persons

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	5,000.....	86
250.....	20	10,000.....	119
500.....	28	25,000.....	178
1,000.....	39	50,000.....	224
2,500.....	61	100,000....	218

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators of the percentages, particularly if the percent is large (50 percent or greater).

Table A-3. Standard Errors of Estimated Numbers of Families of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	1,000.....	26
250.....	14	2,500.....	34
500.....	20	5,000.....	48

Table A-4. Standard Errors of Estimated Numbers of Persons of Negro and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	2,500.....	54
250.....	18	5,000.....	69
500.....	26	10,000.....	72
1,000.....	36		

Table A-5 shows the standard errors of the estimated percentages of families in a given category. Table A-6 shows the standard errors of the estimated percentages of persons.

Illustration of use of the table of standard errors of percentages. Table 37 shows that an estimated 7.9 percent of families with three earners had an income of $10,000 to $11,999 in 1973. Since the base of this percentage is 5,196,000 families with three earners, interpolation in table A-5 shows that the standard error of the estimated 7.9 percent is approximately 0.4 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census figure by less than 0.4 percent. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census figure by less than 0.8 percent. That is, this 95 percent confidence interval would range from 7.1 to 8.7 percent.

Difference between two sample estimates. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristics in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will over-estimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 37 of this report shows that in 1973 an estimated 6.7 percent of families with three earners had an income of $8,000 to $9,999. Thus, the apparent difference in the percentage of families with three earners with incomes of $10,000 to $11,999 and $8,000 to $9,999 is 1.2 percentage points. The standard error of 7.9 percent is approximately 0.4 percent, as shown above. Table A-5 shows the standard error of 6.7 percent on a base of 5,196,000 families to be approximately 0.3 percent. The standard error of the estimated difference of 1.2 percent is about $0.5 = \sqrt{(0.4)^2 + (0.3)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the sample would differ from the difference derived using complete census figures by less than 0.5 percentage points. The 68 percent confidence interval around the 1.2 percent difference is from 0.7 percent to 1.7 percent, i.e., 1.2 percent $\pm$ 0.5 percent. A conclusion that the average estimate of the change derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 0.2 percent to 2.2 percent and thus we can conclude with 95 percent confidence that the proportion of families with three earners with an income in 1973 of $10,000 to $11,999 is actually greater than the proportion with an income of $8,000 to $9,999.

Medians. The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base.

Confidence limits of a median based on sample data may be estimated as follows: (1) From table A-5 or A-6 using the appropriate base, determine the standard error of a 50-percent characteristic, (2) add to and subtract from 50 percent the

Table A-5. Standard Errors of Estimated Percentages of Families

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)								
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000

Table A-6. Standard Errors of Estimated Percentages of Persons

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
2 or 98	1.7	1.1	0.8	0.5	0.3	0.2	0.2	0.1	0.1	0.1
5 or 95	2.7	1.7	1.2	0.9	0.5	0.4	0.3	0.2	0.1	0.1
10 or 90	3.7	2.3	1.7	1.2	0.7	0.5	0.4	0.2	0.2	0.1
25 or 75	5.4	3.4	2.4	1.7	1.1	0.8	0.5	0.3	0.2	0.2
50	6.2	3.9	2.8	2.0	1.2	0.9	0.6	0.4	0.3	0.2

standard error determined in step (1), and (3) using the distribution of the characteristic, read off the confidence interval corresponding to the two points established in step (2). A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table A-5 or A-6.

Illustration of the computation of the standard error of a median. The median income of families with five children was $11,808 in 1973 (Table 27). There were an estimated 1,098,000 families of this type.

1. From table A-5, the standard error of 50 percent of these families expressed as a percentage is about 1.6 percent.

2. As we usually are interested in the confidence interval for the median at the two-standard-error level, we add and subtract twice the standard error obtained in step (1). This yields percentage limits of about 46.8 and 53.2.

3. Since 41.0 percent of these families had incomes below $10,000 and 10.0 percent had incomes between $10,000 and $11,999, the dollar value of the lower limit may be found by linear interpolation to be:

$$\frac{46.8 - 41.0}{10.0} \times \$2{,}000 + \$10{,}000 = \$11{,}160.$$

Since 51.0 percent of these families had incomes below $12,000 and 14.9 had incomes between $12,000 and $14,999 the dollar value of the upper limit is found to be:

$$\frac{53.2 - 51.0}{14.9} \times \$3{,}000 + \$12{,}000 = \$12{,}443.$$

The 95 percent confidence interval is $11,160 to $12,443.

Table A-7 contains 68 percent and 95 percent confidence intervals for various medians of differing magnitudes and bases. A 68 percent confidence interval is defined such that if many samples are taken and a one-standard-error confidence interval is formed for each sample median, about 68 out of 100 of these intervals will contain the median which would be found if a complete census were taken. For a two-standard-error confidence interval, about 95 out of 100 of the intervals formed would contain the census median.

Table A-7. Sampling Variability of Selected Medians

[1]Limited to families with head 25 years old and over.
[2]Limited to persons 25 years old and over.

Approximation of the standard error of the mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}}^2 = R\left[\frac{\sum_{i=1}^{c} p_i x_i^2}{n} - \frac{\bar{x}^2}{n}\right]$$

where n is the weighted total number of cases in all c income classes.

p_i is the percentage of total cases in the i^{th} income class.

x_i is the midpoint of the i^{th} class.

$\bar{x}$ is the mean income of the distribution $\sum_{i=1}^{c} p_i x_i$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, R = 1,700 may be used. To obtain an estimated standard error for a mean income, find $\sigma_{\bar{x}}^2$ and take the square root.

Cross-classification of income and work experience data. This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person within a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey in order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey. The remaining persons whose work experience data were assigned resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces included in the March survey are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference is due largely to the fact that the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

NONRESPONSES AND ALLOCATIONS

In the March 1974 CPS, no information was recorded for approximately 5 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 19 percent of all families and 12 percent of unrelated individuals 14 years old and over. Overall, about 14 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, Proceedings of the Social Statistics Section, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958 a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969.

Starting from the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) An expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missings earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969. See also "Current Developments in Collecting Income Data in the Current Poulation Survey," by Mitsuo Ono, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1971.

OTHER LIMITATIONS OF THE DATA

It is known that income data are usually underreported in household surveys such as the Current Population Survey (CPS). To estimate the magnitude of underreporting in the CPS, estimates of aggregate money income for each source of income collected in the CPS have been made from independent data sources such as the Bureau of Economic Analysis (BEA), the Social Security Administration, the Veterans' Administration, etc. These estimates of aggregate money income from independent sources are derived by adjusting aggregate income figures from these sources to CPS money income concepts. An example of one

of the more important adjustments is the exclusion of "nonmoney" income amounts such as pay to employees in the form of food or lodging or imputed rent of owner-occupied housing from aggregate personal income figures obtained from BEA. A publication covering the general topic of income underreporting is The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States, prepared by T. Paul Schultz for use of the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964.

In last year's report on consumer income, P-60, No. 90, the figures derived from independent data sources were referred to as "independent aggregate income benchmarks." The term "benchmark" has not been used to define the independent aggregate income figures for this report. The word "benchmark" implies a "final or target number," however the independent aggregate income amounts shown here are themselves subject to errors and conceptual differences for which no adequate adjustment is possible. Farm self-employment income is especially troublesome as a result of conceptual problems.

As noted previously, overall aggregate money income compiled in the CPS was about 89 percent of the estimate derived from independent sources in 1973. The highest proportions of aggregate income compiled in the CPS were 97 percent for wage or salary income and 99 percent for nonfarm self-employment income. The proportion picked up for Social Security and railroad retirement payments was 89 percent while the comparable rate for public assistance was 75 percent. The lowest rates were 48 percent for farm self-employment income and 44 percent for property income. (See table A-8.) For more details regarding the procedures to develop independent estimates of aggregate income see the following: (1) "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in Studies in Income and Wealth, Volume 13, National Bureau of Economic Research, 1951, (2) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contributions from nonhousehold members, (2) reluctance to reveal certain types of income types, e.g., public assistance, (3) rounding estimates, (4) misunderstanding the question, (5) lack of information, especially covering family members not present at the time of interview, (6) interviewers' errors, (7) processing errors, etc.

For more details on this topic of income underreporting in censuses and surveys, see: (1) Income Distribution in the United States (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) The Structure of Income, by Irving B. Kravis, University of Pennsylvania, 1962 and, (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" cited earlier in this section.

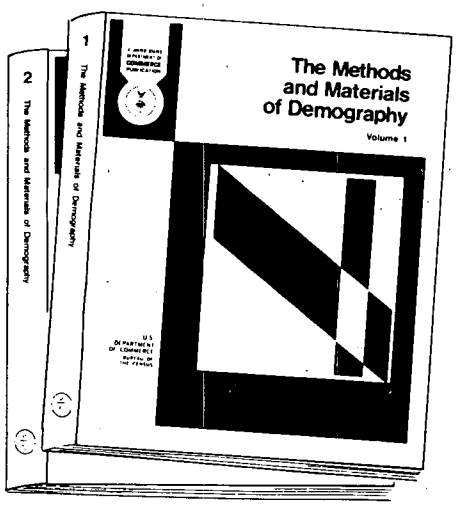
No. 35 Family (Money) Income 1947 to 1971: Summarizing Twenty-Five Years of a Summary Statistic

The Methods and Materials of Demography



These two volumes offer a systematic and comprehensive exposition, with illustrations, of the methods currently used by technicians and research workers in dealing with demographic data. They are intended to serve both as texts for courses in demographic methods and as references for professional workers who use population data. The publications deal with the sources, limitations, underlying definitions, and bases of classification of demographic data, as well as with techniques and methods that have been developed for summarizing and analyzing them.

Topics covered include formal demography and the study of many social and economic characteristics of the population.

The derivation of the demographic measures described is usually illustrated in step-by-step examples using actual statistics, drawn from a wide range of geographic areas, both in the United States and abroad. Considerable emphasis is placed on the kinds of data available for statistically underdeveloped areas, as well as on the special methods applicable to these areas.

At the same time, the materials of the United States are covered in great detail, especially with respect to sources, definitions, and historical developments. Plans for the enumeration, processing, and tabulation of the 1970 Census of the United States are included. The methodological material is presented in the simplest mathematical form and, for the most part, a knowledge of advanced mathematics is not required. The volumes benefit from the contribution of a number of specialists who participated as associate authors.

The two-volume book consists of about 26 subject chapters and three appendixes of reference tables, covering approximately 900 pages. It is printed in the large format of decennial census reports and bound in vellum.

The following is a list of some of the subjects treated and reflects the scope of the work:

- Basic sources of demographic statistics
- Collection and processing of demographic data
- Population size and distribution
- Sex and age composition
- Racial and ethnic composition
- Marital characteristics and family groups
- Educational and economic characteristics
- Mortality and the life table
- Natality
- Reproductivity
- Marriage and divorce
- International migration, internal migration, and short-distance mobility
- Population estimates and projections
- Methods of estimation for statistically underdeveloped areas.

The preparation of the book was supported in part by the Office of Population, U.S. Agency for International Development.

The principal authors are **Henry S. Shryock,** formerly Assistant Chief, Population Division, U.S. Bureau of the Census, and **Jacob S. Siegel,** Staff Assistant for Program Development, Population Division.
