Census Bureau Releases the Response Outreach Area Mapper Web Application

February 07, 2018
Release Number: CB18-TPS.06

Feb. 7, 2018 — Today, the U.S. Census Bureau released the Response Outreach Area Mapper (ROAM) web application. This interactive map makes it easier to identify areas that typically have low response rates for censuses and surveys.

Community planners and local officials can use this information to plan, focus and allocate resources for encouraging response to the 2020 Census. The tool also allows the Census Bureau to tailor outreach efforts and to plan resources, including hiring staff with the right language skills.

These efforts can lead to higher response rates for the 2020 Census, making the census more accurate and more efficient. Census results affect a community’s voice in government, how much funding the community receives, and how it plans for the future.

The ROAM tool provides tract-level data on the area’s low response score (predicted mail non-response rate) and information about its people and households from the American Community Survey, including poverty status, education level, race, Hispanic origin and language ability.

ROAM can also be used to:

- Identify areas where special outreach and promotion efforts could be considered to increase participation in the variety of surveys the Census Bureau conducts.
- Link spatial map data files to create thematic maps showing low response scores in conjunction with demographic data.
- Generate reports, cross tabulations and simple analyses of demographic data.
- Identify hard-to-count tracts by response score and according to specific parameters (e.g., tracts within a certain county).

No news release associated with this product. Tip sheet only.

###
Introduction

- In 1990s Census Bureau developed a Hard to Count Score (HTC)
- Households in each census tract assigned a score
- The higher the score, the harder to count
- Field Division used the score to make hiring decisions and resource allocations
- Partnership Specialists used the score in 2000 and 2010 Censuses to identify areas requiring extra effort

For 2020 Census a new hard-to-survey metric has been developed: the Low Response Score (LRS)
For methodology of LRS see...

Low Response Score

- LRS = predicted level of Census self non-response at the tract level
- Values from 0-100
- So, for example, if LRS=25, we are estimating that 25% of households in that tract will not self-respond to the Census
- LRS is updated yearly
## Low Response OLS Linear Model

Sig: *** $p < .001$; ** $.001 \leq p < .01$; * $.01 \leq p < .05$ R-squared: 56.10%, n = 217,417

Main Effects only, no interaction terms
Distribution of the LRS

Rule of thumb... areas with LRS = >29 are hardest to count?

Source: Erdman and Bates, 2017
Low Response Score (LRS) by Census Tract

Predicted Mail Non-Response Rate (%)
- 30.0 to 57.8
- 25.0 to 29.9
- 20.0 to 24.9
- 16.0 to 19.9
- 0.0 to 15.9
- Not calculated

How do I access the LRS?

- We have built a Web browser-based LRS application
- Branded as: *Response Outreach Area Mapper* (ROAM) [www.census.gov/roam](http://www.census.gov/roam)
- Public interface to map and display characteristics of hard-to-survey areas from the PDB
- ROAM displays census tracts indicating hard-to-survey areas (darker color = higher LRS = harder-to-count)
- ROAM also displays selected variables describing the census tracts
- Allows users to set customized parameters and pull extracts
LRS limitations/cautions

- Only considers mail self-response – 2020 Census will offer internet, phone AND mail
- Some tracts have small Ns in mailback universe, e.g. Indian reservations, very rural areas
- If LRS is extremely high, take a closer look
