## HOUSEHOLD INCOME IN 1967 AND SELECTED SOCIAL AND ECONOMIC CHARACTERISTICS OF HOUSEHOLDS

(An advance report on 1967 household income, Series P-60, No. 57, was published on December 17, 1968)

The median income of all households in the United States in 1967 was $7,200. For reasons cited later, this figure was about 10 percent less than the 1967 median family income of about $8,000. An estimated 11.9 million, or 19.7 percent, of the 60.4 million households in the Nation received money income under $3,000 in 1967. Another 8.1 million, or 13.4 percent, received incomes between $3,000 and $5,000 in 1967; 9.3 million, or 15.4 percent, had incomes between $5,000 and $7,000; and 13.0 million, or 21.6 percent, had incomes between $7,000 and $10,000. The remaining 18.1 million households, or 29.9 percent, received incomes of $10,000 or more.

**Table A.--NUMBER OF HOUSEHOLDS BY 1967 HOUSEHOLD INCOME, FOR THE UNITED STATES**

(Households as of March 1968)

| Household income | Number of households |
|---|---|
| Total | 60,446,000 |
| Under $1,000 | 2,772,000 |
| $1,000 to $1,999 | 4,836,000 |
| $2,000 to $2,999 | 4,302,000 |
| $3,000 to $3,999 | 4,128,000 |
| $4,000 to $4,999 | 3,983,000 |
| $5,000 to $5,999 | 4,583,000 |
| $6,000 to $6,999 | 4,740,000 |
| $7,000 to $7,999 | 4,843,000 |
| $8,000 to $9,999 | 8,184,000 |
| $10,000 to $14,999 | 11,717,000 |
| $15,000 and over | 6,358,000 |

The data presented in this report were derived from the Current Population Survey conducted by the Bureau of the Census and are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For a further discussion of the sampling variability, see the section on "Source and reliability of the estimates," below.

Three types of data are featured in this report: Tables 1 to 4 show statistics on household income by selected characteristics, table 5 shows size of household by selected characteristics, and table 6 shows marital status and sex of household head by selected characteristics. The report brings together a wide range of survey data on social and economic characteristics of households.

The number of households is the same as the number of "primary families and primary individuals," yet the median income of households, as shown in this report, is $7,200. The median income of "primary families and primary individuals combined" is slightly less, $7,100 (table B). The reason for the difference in the two median incomes is the fact that the incomes

This report was prepared by Messrs. Emmett F. Spiers and Joseph J. Knott, Jr., of the Consumer Income Statistics Branch, Population Division, Bureau of the Census.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, 20 cents. Current Population Reports issued in Series P-20, P-23, P-25, P-26, P-27, P-28 (summaries only), P-60, and P-65 are sold as a single consolidated subscription at $8.50 per year, $2.50 additional for foreign mailing.

Table B.--NUMBER, MEDIAN INCOME, AND MEAN INCOME IN 1967 OF HOUSEHOLDS, FAMILIES, AND UNRELATED INDIVIDUALS, BY TYPE, FOR THE UNITED STATES

(Households, families, and individuals as of March 1968)

| Type of unit | Number (thousands) | Type of income unit | Median income | Mean income |
|---|---|---|---|---|
| HOUSEHOLDS | | HOUSEHOLD INCOME | | |
| Total | 60,446 | Total household income | $7,181 | $8,192 |
| Primary family | 49,735 | Primary family | (NA) | (NA) |
| Primary individual | 10,711 | Primary individual | (NA) | (NA) |
| FAMILIES AND UNRELATED INDIVIDUALS | | INCOME OF FAMILIES AND UNRELATED INDIVIDUALS COMBINED | | |
| Total | 62,948 | Total combined income | $6,889 | $7,898 |
| Primary | 60,446 | Primary | 7,094 | 8,093 |
| Secondary | 2,503 | Secondary | 2,358 | 3,188 |
| FAMILIES | | INCOME OF FAMILIES | | |
| Total | 49,834 | Total family income | $7,974 | $9,019 |
| Primary | 49,735 | Primary | 7,983 | 9,030 |
| Secondary | 99 | Secondary | 2,428 | 3,406 |
| UNRELATED INDIVIDUALS | | INCOME OF UNRELATED INDIVIDUALS | | |
| Total | 13,114 | Total | $2,390 | $3,637 |
| Primary | 10,711 | Primary | 2,398 | 3,740 |
| Secondary | 2,404 | Secondary | 2,352 | 3,179 |
| In households | 1,907 | In households | (NA) | (NA) |
| In group quarters | 497 | In group quarters | (NA) | (NA) |

NA Not available.

of secondary family members and secondary individuals in households are included in determining the "household income," but the incomes of these persons are not included with the income of the primary family or primary individual with whom they live in determining the "income of primary families and primary individuals combined."

Even though median household income is higher than the median income of "primary families and primary individuals combined," median household income is 10 percent less than median family income. The main reason for the lower household income is the inclusion of incomes of primary individuals in the household income concept. Ninety-one percent of all primary individuals live alone in one-person households, and, as shown in table 1 on page 12, the median income of one-person households is relatively low, only $2,348 in 1967.

Thus, the key difference between statistics for households and those for families and unrelated individuals lies in the way the population is aggregated for the purpose of counting units, especially in the treatment of household members who are not related to the head (most of whom are secondary individuals) and group quarters members who are not inmates of institutions (all of whom are secondary individuals).

## RELATED REPORTS

Preliminary 1968 data for households, families, and other units were issued on November 5, 1968, in Series P-20, No. 176, "Households and Families, by Type: 1968." Advance 1968 data on household income by selected characteristics of the head were issued on December 17, 1968, in Series P-60, No. 57, "Household Income in 1967 by Selected Characteristics of the Head."

Data on household and family characteristics from the March 1967 Current Population Survey are contained in the P-20 report, No. 173, issued June 25, 1968, "Household and Family Characteristics: March 1967."

Data on family income obtained from the March 1968 Current Population Survey were issued on April 18, 1969, in Series P-60, No. 59. Data on income of persons obtained from the March 1968 Current Population Survey were issued in a separate report, Series P-60, No. 60.

## DEFINITIONS AND EXPLANATIONS

Population coverage.--The population covered in this report includes the civilian population of the United States plus approximately 1,078,000 members of the Armed Forces in the United States

living off post or with their families on post in 1968, but excludes all other members of the Armed Forces. This report excludes inmates of institutions and persons residing in group quarters.

Farm-nonfarm residence.--The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the March 1968 survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 census but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Housing unit, 1960.--A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants. The count of households excludes persons living in group quarters. The kinds of living quarters occupied by quasi-households under the 1950 definitions generally are group quarters under the 1960 definitions. Some quarters formerly regarded as occupied by quasi-households, however, have been divided into housing units because the occupants live separately and their quarters qualify as housing units under the 1960 definition.

Group quarters.--Group quarters are living arrangements for institutional inmates regardless of the number of inmates, or for other groups containing five or more persons unrelated to the person in charge.

Household.--A household includes all of the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants. The count of households excludes persons living in group quarters, such as rooming houses, military barracks, and institutions.

Head of household.--One person in each household was designated as the "head." The number of heads, therefore, is equal to the number of households. The head of a household is usually the person regarded as the head by members of the household. Women are not classified as heads if their husbands are resident members of the household at the time of the survey. Married couples related to the head of a household are included in the head's household and are not classified as separate households.

Marital status.--The marital status classification identifies four major categories: Single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, wife present," "separated," and "other married, wife absent" for male heads and "married, husband absent" by reason for absence of husband for female heads. A male head was classified as "married, wife present" if his wife was reported as a member of the household, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently, or temporarily separated because of marital discord. The groups "other married, wife absent" and "other married, husband absent" include married persons living apart because either the wife or the husband was employed, and living at a considerable distance from home, was residing in an institition, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces.--When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Family.--The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as

members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as secondary families (in households) and not as part of the household head's family. Beginning in 1968, secondary families in group quarters (only 37,000 in 1967) are no longer shown; instead the members are classified as secondary individuals in group quarters.

Unrelated individual.--The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals.--The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual.--A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Income.--For each person in the sample 14 years old and over, questions were asked on the amount of money income received in 1965 from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts or net rental income; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, net royalties, and other periodic income.

The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. If any amount was $10,000 or more, it was recorded as a specific amount wherever possible. When the respondent did not know the specific amount but reported it within specified limits, the midpoint of the amount was coded (i.e., "$10,000 to $15,000" was coded as "$12,500"). If an indefinite amount was reported such as "over $10,000," the information was coded as "$16,000." It should be noted that although the income statistics refer to receipts during 1967 the characteristics of the person, such as age, labor force status, etc., and the composition of households refer to March 1968. The income of the household does not include amounts received by persons who were members of the family during all or part of the calendar year 1967 if these persons no longer resided with the family at the time of enumeration. On the other hand, household income includes amounts reported by related persons who did not reside in the household during 1967 but who were members of the family at the time of enumeration.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains) prior to deductions for taxes. The fact that many farm households receive part of their income in the form of rent-free housing and goods produced and consumed on the farm, rather than in money, should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney incomes are also received by some nonfarm residents. They often take the form of business expense accounts, use of business transportation and facilities, full or partial compensation by business for medical and educational expenses, etc. In analyzing size distributions of income, it should be recognized that capital gains tend to be concentrated more among higher income units than among lower ones.

Money wages or salary.--This is defined as the total money earnings received for work performed as an employee during the calendar year 1967. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment.--This is defined as net money income (gross receipts minus expenses) from his own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business

taxes (not personal income taxes), etc. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment.--This is defined as net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for household living is not included as part of net income. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes.

Social Security.--This is defined as Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, or net rental income.--This category includes dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, and receipts from boarders or lodgers.

Public assistance or welfare payments.--This category includes public assistance payments such as old-age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, or veterans' payments.--This category includes: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans' Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; also includes (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, net royalties, and other periodic income.--The following types of income are included in this group: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) net royalties; and (6) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income.--Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

Total money income.--This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings. The total income of a household is the algebraic sum of the amounts received by all income recipients in the household.

The income tables for households include in the lowest income group (under $1,000) those that were classified as having no income in 1967 and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted households, unrelated individuals who had recently left families, or households in which the sole breadwinner had recently died or had left the household. However, many of the households who reported no income probably had some money income which was not recorded in the survey.

Size of household.--The term "size of household" refers to the number of persons occupying a housing unit.

Number of related children under 18 years of age.--This number refers to all persons in the household under 18 years old related to the head of the household by blood, marriage, or adoption.

Number of earners.--This number includes all persons in the household with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age.--The age classification is based on the age of the person at his last birthday.

Color and race.--The term "color" refers to the division of the population into two groups, white and nonwhite. The nonwhite group includes Negroes, Indians, Japanese, Chinese, and other nonwhite races. The classification by race in this report includes data for white and Negro only.

Years of school completed.--Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status.--The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed.--Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed.--Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force.--Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force.--All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation.--The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings used here are mainly the major groups used in the 1960 Census of Population. The composition of these groups is shown in Volume I, Characteristics of the Population, Part 1, United States Summary, chapter D. The categories used are either detailed classifications or combinations thereof.

Median income.--The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income.--The mean income is the amount obtained by dividing the total income of a group by the number of households or persons (as appropriate) in that group.

Rounding.--Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0.

Base figures.--An estimate of the size of the base (number of households) of each percent distribution by income in 1967 is shown in most of the tables in this report. The base figures shown in this report were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1960 census.

## COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Office of Business Economics personal income series.--The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Office of Business Economics of the Department of Commerce (OBE), nor with the distributions of families and unrelated individuals by family personal income brackets published by that Office. The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition.--The personal income series includes, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 5 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data.--The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The OBE's distributions of families and unrelated individuals by family personal income brackets, which are based on consolidated data from Federal individual income tax returns supplemented by information from field surveys of family income, have been adjusted to agree statistically with the totals in the personal income series. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section on "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates included in the personal income series prepared by the OBE.

3. Population coverage.--The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States. Moreover, persons residing in group quarters at the time the survey was taken are excluded from this report. The income of these groups is included in the aggregate personal income series released by the OBE but is excluded from the OBE's family income distributions. In addition, the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry.

4. Average income.--Most of the average income figures published by the OBE represent mean personal incomes, i.e., they were obtained by dividing an aggregate personal income by a total number of persons (or families). The census averages in this report, on the other hand, are median incomes, representing the point on the

money income scale above and below which one-half of the families (or of the persons receiving income) are to be found. Because of the shape of the income distribution curve, median incomes are considerably smaller than mean incomes. Furthermore, certain of the OBE average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Percent changes in average income from one period to the next, and percent differences in average income among component groups of the population within any one period, will not necessarily correspond for these various averages. This is so because the shape of the income distribution curve changes over time and varies among population groups at any given time, and because the average size of family also varies over time and among groups. As an example of the latter point, the average size of family has increased since the early 1950's so that it can be expected, barring other differences, that a smaller percentage rise in average income for the period will be shown by a series computed on a per capita than on a per family basis. The amount of divergence will vary depending on the extent to which average family size has increased in the particular region or other grouping of the population under consideration.

Department of Agriculture farm income series.--The farm income data shown in this report are not directly comparable with estimates of the aggregate amount of income received by the farm population and estimates of the aggregate farm income of farm operators which are prepared by the Economic Research Service of the Department of Agriculture. Data from the two sources differ in several respects for the reasons cited below:

1. The census data show distributions of persons by farm self-employment income levels and distributions of persons by total money income levels, but do not show estimates of the amount of aggregate income. Agriculture estimates provide information on the amount of aggregate income received by the population but do not provide distributions by income level.

2. The agriculture estimates are based on data derived from farm, business, and governmental sources. As indicated previously, the data presented in this report are based on a field survey of households.

3. The definitions of income are different. The census definition includes, among others, the following items which are not included in the agriculture series: Contributions for support received from persons not residing in the same living quarters and government and business transfers of income.

4. The census data on the total money income of the farm population differ from the agriculture estimates of "net income of the farm population" for reasons other than those cited previously, as follows:

a. The census data do not include under the farm classification the incomes of those nonfarm residents who reported the receipt of some farm income while the agriculture series includes the total net farm income of all farm operators.

b. Income in kind--the imputed value of farm products grown and consumed directly in farm households, and the imputed rental value of owner-occupied farm dwellings--is included in the agriculture series but excluded from the census definition of income.

5. The census data on the civilian noninstitutional population's net income from the operation of a farm differ from the agriculture estimates of farm operators' "net cash income from farming" for reasons other than those cited above, as follows:

a. The census estimates are based on the answers to a single direct question on how much net income was derived from operation of a farm during the preceding calendar year. The agriculture series on "net cash income from farming" is derived by summing estimated cash receipts for a large number of crop and livestock items, and subtracting estimates of the various kinds of cash production expenses incurred.

b. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

c. The agriculture definition of farm expenses used in deriving "net cash income from farming" includes actual expnditures on the repair, construction, or purchase of buildings, machinery, and other capital equipment added on the place while the census definition includes only the money spent on repairs. On the other hand, depreciation charges are treated as farm expenses under the census definition but not in the agriculture series on "net cash income from farming."

Surveys of Consumer Finances.--The Survey of Consumer Finances which has been conducted annually by the Survey Research Center of the University of Michigan provides, among other data, information on the size distribution of income. These surveys are based on nationwide samples that cover all persons in private households. Several important differences between the Survey of Consumer Finances and the present report may be noted:

1. The income-receiving unit in the Survey of Consumer Finances estimates is the spending unit or the family, whereas the data in the present report relate to households.

2. The Survey of Consumer Finances estimates are based on a sample which is different from and smaller (approximately 2,000 spending units in 66 areas) than the census sample. Differences between the results are subject to sampling variability arising from each survey. This factor alone could account for moderate discrepancies between the two sets of data.

3. There are some differences in the estimating procedure. The Bureau of the Census inflated its weighted sample results to agree with independent estimates of the civilian population of the United States by age, color, and sex, whereas the Survey of Consumer Finances weighted sample results were inflated to agree with independent estimates of occupied dwelling units.

4. Only eight income questions are asked for each person in the Bureau of the Census sample whereas numerous detailed questions on income and other financial items are asked of the head of the spending unit and all other members in the spending unit in each household in the Survey of Consumer Finances sample.

Federal income tax data.--For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because persons receiving less than $600 (less than $1,200, if 65 years old and over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; and, consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', and Disability Insurance earnings record data.--Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', and Disability Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers and domestic servants.

2. Employees' earnings in excess of $6,600 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

## SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data.--The estimates are based on data obtained in the Current Population Survey of the Bureau of the Census. The sample is spread over 449 areas comprising 863 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 50,000 occupied households are designated for interview each month. Of this number 2,250 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 50,000, there are also about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not to be interviewed.

The estimating procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, color, and sex. These independent estimates were based on statistics from the 1960 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Reliability of the estimates.--Since the estimates are based on a sample, they may differ somewhat from the figure that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

In most cases the schedule entries for income are based on memory rather than on records, and in the majority of cases on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in table C are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the table of standard errors provides an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percent is large (50 percent or greater).

Table C shows the standard errors of the estimated percentage of households in a given category.

Illustration of use of the table of standard errors of percentages: Table 1 shows that an estimated 18.1 percent of households containing one person had an income of under $1,000 in 1967. Since the base of this percentage is 9,743,000 one-person households, interpolation in table C shows that the standard error of the estimated 18.1 percent is approximately 0.5 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.5 percent. The chances are 95 out of 100 that the estimate would be within 1.0 percent (twice the standard error) of a census figure, i.e., this 95 percent confidence interval would be between 17.1 and 19.1 percent.

The tables in this report present estimates of median income and mean income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base.

Confidence limits of a median based on sample data may be estimated as follows: (1) From table C using the appropriate base, determine the standard error of a 50-percent characteristic, (2) add to and subtract from 50 percent the standard error determined in step (1), (3) the confidence interval for the median corresponding to the two points established in step (2) are then read off the distribution of the new characteristic.

**Table C.--STANDARD ERRORS OF ESTIMATED PERCENTAGE OF HOUSEHOLDS**

| Estimated percentage | Base of percentage (thousands) | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 250 | 500 | 1,000 | 2,500 | 5,000 | 10,000 | 25,000 | 50,000 |
| 2 or 98 | 1.3 | 0.9 | 0.6 | 0.4 | 0.3 | 0.2 | 0.1 | 0.1 |
| 5 or 95 | 2.0 | 1.4 | 1.0 | 0.6 | 0.4 | 0.3 | 0.2 | 0.1 |
| 10 or 90 | 2.7 | 1.9 | 1.3 | 0.8 | 0.6 | 0.4 | 0.3 | 0.2 |
| 25 or 75 | 3.9 | 2.8 | 2.0 | 1.3 | 0.8 | 0.6 | 0.4 | 0.3 |
| 50 | 4.5 | 3.2 | 2.3 | 1.4 | 1.0 | 0.7 | 0.4 | 0.4 |

A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table C.

Illustration of the computation of the standard error of a median: The median income of one-person households is $2,348 in 1967 (table 1). There were an estimated 9,743,000 households of this type.

1. From table C, the standard error of 50 percent of these households expressed as a percentage is about 0.7 percent.

2. As we are usually interested in the confidence interval for the median at the two-standard-error level, we add and subtract twice the standard error obtained in step (1). This yields percentage limits of 48.6 and 51.4.

3. Since 44.9 percent of these households had incomes below $2,000 and 7.5 percent had incomes between $2,000 and $2,499, the dollar value of the lower limit may be found by linear interpolation to be

$$\frac{48.6 - 44.9}{7.5} \times \$500 + \$2,000 = \$2,247$$

The dollar value of the upper limit is found to be

$$\frac{51.4 - 44.9}{7.5} \times \$500 + \$2,000 = \$2,433$$

Then a 95-percent confidence interval for the median income of one-person households is ($2,247, $2,433).

Approximating the standard error of a mean: To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}}^2 = R\left[\frac{\sum_{i=1}^{c} p_i x_i^2}{n} - \frac{\bar{x}^2}{n}\right]$$

where n is the weighted total number of cases in all c income cases.

$p_i$ is the percentage of total cases in the $i^{th}$ income class.

$x_i$ is the midpoint of the $i^{th}$ class.

$\bar{x}$ is the mean income of the distribution $\sum_{i=1}^{c} p_i x_i$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, R = 1,800 may be used. To obtain an estimated standard error for a mean income, find $\sigma_{\bar{x}}^2$ and take the square root.

## Table 1.--Size of Household and Relationship--Households by Total Money Income in 1967, for the United States

(Excludes inmates of institutions; includes 1,078,000 members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces. Households as of March 1968)
