POVERTY IN THE UNITED STATES: 1959 TO 1968

This report presents data on poverty in the United States from 1959 to 1968. The detailed tables present data for each year from 1959 to 1968 separately for all poor, and two racial classifications: (1) white and (2) Negro and other races. Appendix tables contain data for 1966, 1967, and 1968 for Negroes alone. A description of the poor in 1968 and some analysis of the changes that occurred between 1959 and 1968 are offered. Although the primary focus of this report is on the United States as a whole, poverty data are also presented for metropolitan and nonmetropolitan areas. Selected data are shown separately for the central city and suburban portions of metropolitan areas. This is the first Census Bureau report to present such detailed poverty data based on the revised poverty definition adopted as the official standard in 1969. (See Definitions and Explanations, page 10, for a description of the revised definition.) Summary data for the United States based on the revised definition of poverty in addition to an explanation of the modifications made in the poverty definition were previously published in "Revision in Poverty Statistics, 1959 to 1968," Current Population Reports, Series P-23, No. 28.

TRENDS SINCE 1959

Persons below the poverty level.--Between 1959 and 1968 the number of poor persons in the United States declined from 39 million to 25 million (table A). The proportion of persons below the poverty level declined from about 22 percent in 1959 to 13 percent in 1968. In both 1968 and 1959 the poverty rate among persons of Negro and other races was about three times the rate among whites. Persons of Negro and other races accounted for about one-third of all poor persons in 1968. The number of persons dependent on each

[1]Other than head and wife.

poor family head was higher for Negro and other races than for whites in both 1968 and 1959. In 1968, the average poor white family had 3.7 members, compared with 5.0 members in the average poor family of Negro and other races. There were 2.9 children in the average white poor family containing children in 1968, compared with an average of 3.7 among comparable families of Negro and other races.

The family status of poor persons has undergone some significant changes since 1959. The proportion of the poor population who were either members of families with a male head or male unrelated individuals declined by about one-half between 1959 and 1968 (table B). However, there was no measurable change in the number of poor members of families with a female head and female unrelated individuals during this period. Indeed, among Negro and other races the number of such persons increased from 3.3 million to 4.0 million from 1959 to 1968. Those poor persons residing in families with a female head and female unrelated individuals accounted for 26 percent of all poor persons in 1959 but 41 percent of the total in 1968. Among Negro and other races about half of all poor persons in 1968 were residing in families headed by women or were female unrelated individuals.

[1]Other than head or wife.

Families below the poverty level.--There were 3.3 million fewer poor families in the United States in 1968 than in 1959 (table C). This represented a 39 percent decline in the number of poor families during this 9-year period. The number of poor white families dropped by about 42 percent while a 27 percent decline was recorded for poor Negro families. In addition to differences in the rates of decline between poor white and poor Negro families, it is apparent that poverty declined more sharply for some types of families within each racial group than for other types. Between 1959 and 1968, a greater rate of decline was observed for poor families headed by men under 65 years of age than for poor families headed by women in that age group. Although there was about a 54 percent reduction in the number of poor Negro families headed by men under 65 years old, there was an increase of 34 percent in the number of poor families headed by Negro women under 65. Thus, the proportion of Negroes among all poor families with female heads under 65 years of age grew from 30 percent in 1959 to 43 percent in 1968. The proportion of poor families headed by a person 65 or over was higher among white families than among Negro families in both 1968 and 1959. In 1968, families with an aged head accounted for 27 percent of all poor white families but only 15 percent of all poor Negro families. The type of family found among those poor families with heads under 65 years of age varied greatly between whites and Negroes. Among whites, men headed about two-thirds of all poor families with heads under age 65. Among Negroes, however, more women than men headed such families. Among families with heads under 65, the proportion of poor Negro families headed by women increased from 31 percent to 56 percent between 1959 and 1968.

X Not applicable.

The poverty rate in 1968 was sharply reduced from what it had been 9 years earlier (table D). The income of every 10th family fell below the poverty standard in 1968 whereas about one in five of all families had been poor in 1959. The proportion of poor families in the United States declined for both racial groups between 1959 and 1968. However, in the latter year as in the former, the poverty rate among families of Negro and other races was about three times as great as among white families.

In both 1968 and 1959 the poverty rate was higher among families with an aged head than among those headed by a person under 65 years of age. Other groups with relatively high poverty rates were the very largest families (those with seven or more members) and those with five or more children. Among poor families, 15 percent had five or more members under 18 years of age while only 4 percent of families above the poverty level had that many children. About 53 percent of the families of Negro and other races with five or more members under 18 years of age were below the poverty level in 1968. Higher than average poverty rates were also observed among families having an unemployed head or one who was not in the labor force. These characteristics prevailed among one-half of all poor families, but were found among only 17 percent of families with incomes above the poverty level in 1968.

[1]Other than head or wife.

In several respects the characteristics of poor families in 1968 differed from those of families below the poverty level in 1959. The altered composition of the poor reflects the variations in the rates of change among different types of poor families between 1959 and 1968. The decline in the number of poor families having difficulty obtaining adequate income from productive participation in the labor force failed to match the decline among poor families with greater ability to provide income through employment. Thus, the proportion of families with a female head among the poor rose from 23 to 35 percent from 1959 to 1968 (table D). The proportion of poor families without an earner grew similarly (from 24 percent to 33 percent). Poor families whose head was not in the labor force increased from 39 percent to 49 percent of all poor families between 1959 and 1968. During the same time, the proportion of poor family heads reporting work experience during the year declined from 68 percent to 57 percent.

The poverty gap.--Some measure of the degree of impoverishment is provided by the size of the gap between the poverty threshold and the amount of income received by the family. In 1968 the incomes of about half of all poor families were $1,000 or more below the applicable poverty threshold (table E). About the same distribution prevailed in 1959.

The incomes of poor families headed by men were closer to the poverty line than those of families headed by women in both 1959 and 1968. About 31 percent of the poor families headed by men had

incomes within $500 of the poverty threshold in 1968. Only 20 percent of the poor families headed by women had incomes that close to the poverty line.

On the average, poor white families were not as deeply impoverished as those of Negro and other races in either 1968 or 1959. The median income deficit for all poor white families was about $910 in 1968, compared with a gap of $1,260 for families of Negro and other races. The median income deficits of poor white families headed by men were not as large as those for comparable families of Negro and other races. Among poor families headed by women in 1968, 23 percent of the white families and about 15 percent of the families of Negro and other races had incomes within $500 of the poverty level.

Almost 10 billion dollars would have been required to bring the income of poor families and unrelated individuals up to the poverty level in 1968 (table F). The amount needed to raise the incomes of the poor to the poverty level was about 4 billion dollars less in 1968 than in 1959. The distribution of the aggregate deficit between whites and Negro and other races remained the same in both years. About 72 percent of the aggregate income deficit of the poor was accounted for by whites in both 1968 and 1959.

Unrelated individuals accounted for a larger share of all poor families and unrelated individuals in 1968 than in 1959. The proportion of unrelated individuals increased from 37 percent to 48 percent during this 9 year period. Among poor whites, there were about the same number of unrelated individuals as families in 1968, while for Negro and other races, unrelated individuals constituted only 37 percent of the total. White unrelated individuals required 39 percent of the total white income deficit to raise their incomes up to the poverty level in 1968. Among unrelated individuals who were of Negro and other races, however, only 24 percent of the aggregate income deficit would have brought their incomes up to the poverty level. In 1968, about 21 percent of the aggregate poverty deficit for whites was accounted for by poor families headed by women. Families of this type were responsible for 42 percent of the total income deficit for Negro and other races.

Poverty in metropolitan and nonmetropolitan areas.--Poor persons in the United States in 1968 were about equally distributed between metropolitan and nonmetropolitan areas (table G). Between 1959 and 1968 the number of poor families declined more sharply outside metropolitan areas than within metropolitan areas (table H). There were about 45 percent fewer poor families in the nonmetropolitan small towns and rural areas in 1968 than in 1959. During the same time the number of poor families within metropolitan areas declined by one-fourth. Between 1959 and 1968 the proportion of the poor residing within metropolitan areas increased from 44 percent to about 51 percent. The majority of poor persons in metropolitan areas were central city residents. In 1968, 25 percent of all poor white persons and 42 percent of all poor Negro persons were residents of central cities of metropolitan areas. Both within metropolitan areas and outside metropolitan areas the percentage decline in the number of poor families and unrelated individuals among whites surpassed the decline among Negroes.

Outside metropolitan areas	49.3	56.1	51.3	58.3	45.6	49.6

In contrast to the general diminution of poverty among all families in metropolitan areas, the number of poor families headed by women in these areas increased by 29 percent from 1959 to 1968 (table H). In both central cities and suburban rings there were more poor female family heads in 1968 than in 1959. In metropolitan areas the rate of increase from 1959 to 1968 for female headed families with incomes below the poverty level was greater among Negro than among white families. In these areas the number of poor Negro families increased by about one-half between 1959 and 1968. Negroes accounted for 44 percent of all poor families with female heads in metropolitan areas and 55 percent of such families within central cities in 1968. The substantial overall reduction in poverty for families in metropolitan areas recorded between 1959 and 1968 occurred only among those headed by men. During this period the number of poor families headed by men declined by 45 percent.

RELATED REPORTS

A detailed explanation of the revised poverty definition appears in Current Population Reports, Series P-23, No. 28, "Revision in Poverty Statistics, 1959 to 1968."

A detailed description of the original poverty index developed by the Social Security Administration appears in the following articles by Mollie Orshansky published in the Social Security Bulletin: "Counting the Poor: Another Look at the Poverty Profile," January 1965, and in Who's Who Among the Poor: A Demographic View of Poverty," July 1965. For other related articles on poverty by Mollie Orshansky, see the Social Security Bulletin: "Recounting the Poor-A Five Year Review," April 1966; "More About the Poor in 1964," May 1966; "The Poor in City and Suburb, 1964," December 1966; and "The Shape of Poverty in 1966," March 1968.

Advanced data on the poor in 1968 appear in Current Population Reports, Series P-20, No. 189, "Selected Characteristics of Persons and Families: March 1969."

A comprehensive report on the characteristics of residents of metropolitan and nonmetropolitan areas has been published in Current Population Reports, Series P-23, No. 27, "Trends in Social and Economic Conditions in Metropolitan Areas."

Current Population Survey.--Data based on the Current Population Survey showing the distribution of families, unrelated individuals, and persons, by income levels, have been published in the Series P-60 reports, number 1 to 66. Data on poverty similar to those presented here but based on the original poverty definition appear in Current Population Reports, Series P-60, No. 54, "The Extent of Poverty in the United States: 1959 to 1966."

The detail shown in this report for the characteristics of persons and families below the poverty level in 1959 to 1968 was also tabulated separately for those with incomes less than 75 percent and 125 percent, respectively, of the amounts specified as the poverty thresholds. Requests for these unpublished data, giving a specific description of the figures desired, may be made by writing to the Chief, Population Division, Bureau of the Census, Washington, D.C. 20233.

DEFINITIONS AND EXPLANATIONS

Population coverage.--This report excludes inmates of institutions. It includes only those members of the Armed Forces living off post or with their families on post.

Farm-nonfarm residence.--The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey is the same as that used in the 1960 census and in the Current Population Surveys since 1960, but differs from that used in earlier surveys and censuses. According to the current definitions, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for $250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for $50 or more in the previous year. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence.--The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1960 census and does not include any subsequent additions or changes.

Central cities.--The population inside SMSA's is further classified as "in central cities" and "in suburban rings." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

   a. The additional city or cities have at least 250,000 inhabitants.

   b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Income.--For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts or net rental income; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, net royalties, and other periodic income.

The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 was coded as $16,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains) prior to deductions for taxes. The fact that many farm families receive part of their income in the form of rent-free housing and goods produced and consumed on the farm, rather than in money, should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney incomes are also received by some nonfarm residents. They often take the form of business expense accounts, use of business transportation and facilities, full or partial compensation by business for medical and educational expenses, etc. In analyzing size distributions of income, it should be recognized that capital gains tend to be concentrated more among higher income units than among lower ones.

Receipts not counted as income.--Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

The Poverty Definition.--Poverty statistics published in previous Census Bureau reports were based on the poverty index developed by the Social Security Administration (SSA) in 1964.[1] This index provided a range of poverty income cutoffs adjusted by such factors as family size, the sex of the family head, the age of family members, and place of residence. At the core of this definition of poverty was a nutritionally adequate food plan ("economy" plan) designed by the Department of Agriculture for "emergency or temporary use when funds are low." Annual revisions of the poverty income cutoffs were based on price changes of the items in the economy food budget.

In determining the proportion of total family income that should be consumed by food requirements, the SSA observed that the percentage of income expended for necessities, in particular food, reflects the relative well being of both individuals and the society in which they live. In general, families that need to use about the same proportion of their income for a given level of food expenditure are considered to share the same level of living. For families of three or more persons the poverty level was set at three times the cost of the economy food plan. This was the average food cost-to-family income relationship reported by the Department of Agriculture on the basis of a 1955 survey of food consumption.[2] For smaller families and persons residing alone, the cost of the economy food plan was multiplied by factors that were slightly larger to compensate for the relatively higher fixed expenses of these smaller households. The SSA poverty cutoffs also took account of differences in the cost of living between farm and nonfarm families.

As a result of the deliberations of a Federal Interagency Committee the following two changes were incorporated into the definition of poverty employed prior to 1969: (1) the SSA poverty thresholds were retained for the base year 1963, but annual adjustments in the poverty levels were based on the changes in the Consumer Price Index (CPI) rather than on changes in the cost of food in the economy food plans; and (2) farm poverty thresholds were raised from 70 to 85 percent of the corresponding nonfarm levels. The resulting poverty thresholds for 1968 are presented in table I. The combined impact of these two modifications resulted in a net increase of 360,000 poor families and of 1.6 million poor persons in 1967. The reasons for making these changes and the effect of each revision on the poverty data are outlined below.

Change in the cost of living adjustment.--General price changes since 1959 were not paralled by comparable changes in the cost of the economy food plan which served as the basis for adjusting the thresholds of the original poverty definition. For example, the CPI went up by 13.7 percent between 1959 and 1966, while poverty thresholds increased by 7.9 percent for an average

[1]For a detailed discussion of the SSA poverty standards, see Mollie Orshansky, "Counting the Poor: Another Look at the Poverty Profile," Social Security Bulletin, January 1965; and "Who's Who Among the Poor: A demographic View of Poverty," Social Security Bulletin, July 1965.

Table I.--WEIGHTED AVERAGE THRESHOLDS AT THE POVERTY LEVEL IN 1968 BY SIZE OF FAMILY AND SEX OF HEAD, BY FARM-NONFARM RESIDENCE

Number of family members	Total	Nonfarm			Farm		
		Total	Male head	Female head	Total	Male head	Female head
1 member	$1,742	$1,748	$1,827	$1,700	$1,487	$1,523	$1,441
2 members	2,242	2,262	2,272	2,202	1,904	1,910	1,812
3 members	2,754	2,774	2,788	2,678	2,352	2,359	2,258
4 members	3,531	3,553	3,555	3,536	3,034	3,031	3,018
5 members	4,158	4,188	4,191	4,142	3,577	3,578	3,565
6 members	4,664	4,706	4,709	4,670	4,021	4,021	4,020
7 or more members	5,722	5,789	5,804	5,638	4,916	4,919	4,847

family during the same period. Poverty data are shown for 1967, 1963, and 1959 in table J using both the CPI and the original method of updating the poverty thresholds and also incorporating the changes in the farm cutoffs. The impact of using the CPI rather than changes in the cost of the economy food plan to adjust the poverty cutoffs for annual changes in the cost of living can be seen most clearly by comparing the nonfarm poverty data based on each of the two price adjustment techniques. Since the difference in the CPI between 1959 and 1963 was greater than the change in the original poverty index during the same period, the number of nonfarm families below the poverty level in 1959 based on the CPI adjustment is 260,000 less than the number originally published. For 1967 the introduction of the CPI cost of living adjustment increased the number of poor nonfarm families by 210,000 and the number of poor nonfarm persons by 880,000 over the number originally published. For a nonfarm family of four persons, the revised thresholds in 1967 averaged $3,410 as compared with $3,335 based on the original definition.

Change in the farm-nonfarm relationship.--Under the old definition, the poverty thresholds for farm families were adjusted for the average value of food consumed by these families which they had grown themselves. The poverty cutoffs for farm families were established at 70 percent of the nonfarm levels based on a 1961 study of household consumption which indicated that the value of food produced by farm families for home use amounted to about 30 percent of their total food budget.

Up to the present time, no entirely satisfactory means of determing the income required for equivalent levels of living for farm and nonfarm families has been provided by studies on this subject. Further research is needed to analyze differences in living costs between farm and nonfarm families. Although it is not yet possible to quantify exactly all the factors contributing to cost of living differences between farm and nonfarm families, research already completed suggests that these differences are not as great as provided for by the 70 percent differential. After weighing the available evidence, the Review Committee agreed that narrowing the farm-nonfarm poverty threshold differential to 85 percent more nearly reflects the overall cost of living differences between farm and nonfarm families than the previously used differential.

The impact of the change in the farm-nonfarm relationship can be seen in table J which shows the farm poverty data for 1967, 1963, and 1959 under the revised and original definitions. The change in the number of farm poor can best be analyzed by the use of data for 1963 which serves as the base year for the cost of living adjustment. For that year, as table J indicates, the number of farm poor under the revised definition was about 1.1 million higher than originally published.

Poverty gap.--The poverty gap is the difference between the total income of families and unrelated individuals below the poverty level, and their respective poverty thresholds. In computing the income deficit, families reporting a net income loss are assigned zero dollars and for such cases the poverty gap is equal to the poverty threshold. This measure provides an estimate of the amount which would be required to raise the incomes of all poor families and unrelated individuals to their respective poverty thresholds.

Median income deficit of the poor.--The median income deficit is the amount which divides the distribution into two equal groups, one having an income deficit above the median, and the other having an income deficit below the median.

Mean income deficit of the poor.--The mean income deficit is the amount obtained by dividing the total income deficit of a group below the poverty level by the number of families or unrelated individuals, (as appropriate) in that group.

Family.--The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Head of family.--One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Size of family.--The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Unrelated individual.--The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of

Table J.--COMPARISON OF POVERTY DATA IN 1967, 1963, AND 1959 FOR PERSONS BY FAMILY STATUS AND FARM-NONFARM RESIDENCE, BASED ON REVISED AND ORIGINAL POVERTY DEFINITIONS

[r] Based on revised methodology for processing income data; see Nonresponses and Allocations, p. 15 for explanation.
[1] Other than head and wife.

institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Own children.--"Own" children in a family are sons and daughters, including step children and adopted children, of the family head.

Family members under 18 years old.--Persons in families, other than the head or wife, who were under 18 years old and who were related to the head of the family by blood, marriage, or adoption, were classified as family members under 18 years old. This concept differs from the previously used concept of related children under 18 years of age, which was defined as all single (never married) persons under 18 years old in families who were related to the head of the family by blood, marriage, or adoption, in that the family members under 18 concept is not restricted by marital status.

Number of earners.--This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age.--The age classification is based on the age of the person at his last birthday.

Race.--The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Labor force and employment status.--The definitions of labor force and employment status in this report relate to family heads and unrelated individuals 14 years old and over.

Employed.--Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed.--Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force.--Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force.--All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation of longest job.--Persons are classified according to the civilian job held longest during the year. Persons who held two jobs or more were reported in the job at which they worked the greatest number of weeks.

Work experience.--A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year.--Persons are classified according to the number of different weeks, during the preceding calendar year, in which

they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs.--A person is classified as having worked at part-time jobs, during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker.--A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker.--A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Main reason for working part year.--For persons who worked 1 to 49 weeks during the year, the main reason for working part year is based on the response to the question "What were you doing most of the remaining weeks?"

Main reason for not working.--For persons who reported that they did not work at a civilian job for pay or profit or on a family-operated farm or business during the year, the main reason for not working is derived from the response to the question "What were you doing most of last year?"

Rounding.--Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0.

NONRESPONSES AND ALLOCATIONS

In the March 1969 CPS, no information was recorded for approximately 5 percent of the 50,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 19 percent of all families and about 14 percent of all persons 14 years old and over in households that were interviewed.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.)

Beginning with the 1967 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) an expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked, the new procedures include sex and type of family member

as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings.

However, because of coding errors in the processing of the 1968 CPS data, in that year alone it was not possible to apply all the aforementioned improvements to the editing and allocation procedures. Since these errors produced an underestimate of income, they had the effect of overstating the number of poor families by about 175,000 and the number of poor persons by approximately 450,000. In addition, it was discovered that the computer procedures for editing certain incorrect income codes caused an upward bias in the income data for some respondents and therefore would tend to produce an underestimate of the number of poor. The impact of this faulty editing procedure has not yet been fully documented. Due to errors affecting the income data for 1967, poverty data for that year are not strictly comparable with those shown for 1966 and 1968.

Comparison of 1966 poverty data according to original and revised editing and allocation procedures.--In order to evaluate the impact of the new procedures, the poverty data from the March 1967 CPS were rerun, thus providing a bridge for the 1966 income year showing the results of both the earlier and the new procedures. Both series of data are shown in the detailed tables showing time trends.

Table K.--COMPARISON OF INCOME AND POVERTY DATA FOR 1966 BASED ON ORIGINAL AND REVISED EDITING AND ALLOCATION PROCEDURES

Unrelated individuals 14 years and over	4,701	4,810	3,860	4,019	841	791

[1]Other than head and wife.

The general impact of the new allocation procedure was to shift the income distribution slightly upward, thus decreasing by 416,000 the number of families below the poverty level (table K). The median family income obtained from the new procedure was about $60 higher than that obtained from the old procedure and the income distributions moved upward correspondingly. The new procedure raised the number of multiearner families by slightly over 1.2 million and reduced the number of one- and no-earner families by about the same amount. This was the result of the introduction of a new edit for consistency of work experience and earnings. A more detailed description of the new computer editing and allocation procedures may be found in Current Population Reports, Series P-60, No. 59, "Income in 1967 of Families in the United States," pages 17 to 19.

Modifications in collecting income data in the March-April 1969 CPS.--Several modifications were introduced in the collection of income data in the March and April CPS supplements. These include (1) extension of the interview period of the six rotation groups for which income questions were asked in March and the use of followup forms in these six groups to accommodate household respondents who needed more time to obtain the required income information (it is estimated that some members of approximately 4,400 households, or 9 percent of the total relevant households, made use of these followup forms); (2) modification of the design and content of the questionnaire to allow for more detailed questioning of certain income items, thus, boxes for gross receipts, business expense, and net income have been added to the self-employment income questions to help the interviewer and respondent determine net income, and "yes-no" circles were added to the questions on income other than earnings in order to ascertain whether the respondent received or did not receive income; (3) field office editing procedures were extended to a 100-percent income edit of the CPS schedules; (4) training instructions were strengthened by including more detailed explanations and more examples; and (5) the interview group training session was shifted to March (from February).

A detailed evaluation of the impact of these modifications on income data is currently in process. However, a preliminary review indicates that these modifications have resulted in slight improvements in the collection of income data. For a more detailed statement of these changes see the paper by Mitsuo Ono and Herman P. Miller entitled "Income Nonresponses in the Current Population Survey," to be published in Proceedings of the Social Statistics Section, American Statistical Association, 1969.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data.--The estimates for the United States are based on data obtained in the Current Population Survey of the Bureau of the Census. For 1967 through 1969 the sample is spread over 449 areas comprising 863 counties and independent cities, with coverage in each of the 50 states and the District of Columbia. Approximately 50,000 households are designated in the Current Population Survey for interview each month. Of this number, 2,250 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition, there are also about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not to be enumerated. For the years prior to 1967, the sample was spread over fewer areas with fewer interviewed households. Prior to the March 1966 survey, income data were collected from only 75 percent of the households included in the CPS. See Current Population Reports, Series P-23, No. 22, "Concepts and Methods Used in Manpower Statistics from the Current Population Survey," June 1967, pp. 7-10, for more information about the sample design.

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1960 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that all members of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

To show comparable poverty data for 1968 and 1959 by detailed type of residence it was necessary to use data from the 1960 census rather than from the 1960 Current Population Survey (CPS). The type of residence classification used in the 1960 CPS was based on data from the 1950 census. Therefore, to achieve comparability with March 1969 CPS data, special tabulations of poverty data from the 53,000 households in a 1-in-1,000 sample of 1960 census data were prepared. These tabulations were designed to eliminate conceptual differences between 1960 census data and the 1969 CPS data.

Reliability of the estimates.--Since the estimates in this report are based on a sample, they differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability.

In most cases the schedule entries for income are based on memory rather than on records, and in the majority of cases on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in tables L, M, N, and O are approximations to the standard errors of various estimates shown in this report for the year 1968. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Table L contains the standard error of estimates of the number of persons in a given class. Table M contains the standard error of estimates of the number of families in a given class. Table M should also be used for items which can typically appear only once in a given family as, for example, "Number of female heads."

Table N shows the standard errors of estimated percentages of persons for different sizes of the bases of the percentages. Table O shows the standard errors of estimated percentages of families. The guidelines used to decide whether table L or table M is appropriate for a particular item should also be used for deciding between the use of tables N and O.

Table L.--STANDARD ERRORS OF ESTIMATED NUMBERS OF PERSONS: 1968

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
25,000.....	7,000	2,500,000.....	83,000
50,000.....	10,000	5,000,000.....	129,000
100,000.....	15,000	10,000,000.....	214,000
250,000.....	23,000	25,000,000.....	452,000
500,000.....	34,000	50,000,000.....	845,000
1,000,000.....	49,000	100,000,000....	1,630,000

Table M.--STANDARD ERRORS OF ESTIMATED NUMBERS OF FAMILIES: 1968

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
25,000.....	8,000	2,500,000.....	80,000
50,000.....	11,000	5,000,000.....	120,000
100,000.....	15,000	10,000,000.....	192,000
250,000.....	25,000	25,000,000.....	365,000
500,000.....	34,000	50,000,000.....	645,000
1,000,000.....	49,000		

Table N.--STANDARD ERRORS OF ESTIMATED PERCENTAGES OF PERSONS: 1968

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)							
	250	500	1,000	2,500	5,000	10,000	25,000	50,000
2 or 98.....	1.4	1.0	0.7	0.4	0.3	0.2	0.1	0.1
5 or 95.....	2.2	1.6	1.1	0.7	0.5	0.4	0.2	0.1
10 or 90.....	3.0	2.1	1.5	1.0	0.7	0.5	0.3	0.2
25 or 75.....	4.4	3.1	2.2	1.4	1.0	0.7	0.4	0.3
50.....	5.1	3.5	2.5	1.6	1.1	0.8	0.5	0.4

Table O.--STANDARD ERRORS OF ESTIMATED PERCENTAGES OF FAMILIES: 1968

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)							
	250	500	1,000	2,500	5,000	10,000	25,000	50,000
2 or 98	1.3	0.9	0.6	0.4	0.3	0.2	0.1	0.1
5 or 95	2.0	1.4	1.0	0.6	0.4	0.3	0.2	0.1
10 or 90	2.7	1.9	1.3	0.8	0.6	0.4	0.3	0.2
25 or 75	3.9	2.8	2.0	1.3	0.8	0.6	0.4	0.3
50	4.5	3.2	2.3	1.4	1.0	0.7	0.4	0.4

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percent is large (50 percent or greater).

Standard errors for CPS data for 1959 can be approximated by multiplying the appropriate 1968 table entry by 1.4.

Standard errors for data obtained from the 1-in-1,000 sample of the 1960 census can be approximated by multiplying the appropriate 1968 table entry by 0.7.

Illustration of the use of table of standard errors.--Table A of this report shows that in 1968, there were 7,994,000 persons of Negro and other races below the poverty level. Table L shows the standard error on an estimate of this size to be approximately 180,000. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 180,000. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 360,000 (twice the standard error).

Of these 7,994,000, 845,000 or 10.6 percent, are unrelated individuals 14 years and over. Table N shows the standard error of 10.6 percent on a base of 7,994,000 to be approximately 0.6 percent. Consequently, chances are 68 out of 100 that the estimated 10.6 percent would be within 0.6 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 1.2 percentage points of a census figure, i.e., this 95-percent confidence interval would be between 9.4 and 11.8 percent.

Table 1.--PERSONS BELOW POVERTY LEVEL IN 1959 TO 1968, BY FAMILY STATUS AND SEX AND RACE OF HEAD, FOR THE UNITED STATES, FARM AND NONFARM
