DETAILED TABLES

Money Income of Families, Persons, and Households in 1984

1. Selected characteristics of families—number of families and median income in 1984 and 1983 of all families and families with householders working year round full time, by race and Spanish origin of householder	6
2. Family income in 1970 to 1984—families, by total money income, race, and Spanish origin of householder	9
3. Family income in 1970 to 1984—families, by total money income in 1984 dollars, race, and Spanish origin of householder	10
4. Number of families and unrelated individuals, income at selected positions, and percentage share of aggregate income in 1984 received by each fifth and top 5 percent of families and unrelated individuals, by race of householder and region	11
5. Race and farm-nonfarm residence—families and unrelated individuals, by total money income in 1984	11
6. Age of householder—families and unrelated individuals, by total money income in 1984	12
7. Selected characteristics of persons—number with income and median income in 1984 and 1983 of all persons 15 years old and over and persons working year round full time, by sex	13
8. Race and farm-nonfarm residence—persons 15 years old and over, by total money income in 1984 and sex	15
9. Marital status—persons 18 years old and over, by total money income in 1984 and sex	15
10. Age—persons 15 years old and over, by total money income in 1984 and sex	16
11. Work experience in 1984—civilians 15 years old and over, by total money earnings in 1984 and sex	17
12. Total money income in 1970 to 1984—persons 14 years old and over, by sex	18
13. Selected characteristics of households—households, by total money income in 1984	19

Money Income and Poverty Status of Families and Persons in the United States: 1984 (Advance Report)

Estimates in this report are based on a sample that includes households from both the 1970 census-based sample design and the new 1980 census-based design. Since this overlap in the sample design does not permit the development of estimates for metropolitan, nonmetropolitan, farm, and nonfarm categories that are comparable to either the 1980 or 1970 census definitions, figures for these residence categories have been omitted. The estimates in this report for 1983 and 1984 reflect the introduction of new survey weighting procedures for the Spanish-origin population. See the section on revised survey procedures for a detailed explanation of these changes.

HIGHLIGHTS

For the second year in a row, median family income increased faster than inflation according to results of the March 1985 Current Population Survey (CPS) conducted by the Bureau of the Census. In 1984, median family income was $26,430, 7.7 percent higher than the 1983 median of $24,550. After adjusting for the 4.3-percent increase in consumer prices between 1983 and 1984, real median family income still showed a significant gain of 3.3 percent.[1] Not since 1972 has family income increased at a faster rate.

Along with the increase in real family income was a significant decline in the poverty population, reversing a trend of increases in poverty experienced in recent years. Between 1983 and 1984, the poverty population fell from 35.5 million to 33.7 million. The poverty rate in 1984 was 14.4 percent, also significantly lower than the 1983 rate of 15.3 percent. The poverty threshold for a family of four in 1984 was $10,609.

INCOME OF FAMILIES

Increased employment and higher real earnings levels were important factors that helped boost real median family income between 1983 and 1984. Monthly civilian employment increased throughout 1984 continuing the trend that started in January of 1983. The annual average number of employed civilians rose from 100.8 million in 1983 to 105.0 million in 1984, and the employment-to-population ratio went from 58 to 60 percent. The proportion of families with a householder working year round full time rose from 55 to 57 percent, and the proportion of families with two or more earners also increased slightly from 55 to 56 percent. Both men and women working year round full time experienced significant increases in real earnings.

The net gain in median family income after adjusting for the 4.3-percent increase in consumer prices was 3.3 percent. The real increase in 1984 follows a 1.6-percent rise recorded for 1983. There has not been a larger annual increase in median family income since 1972 when median income rose 4.6 percent. During this 1972-84 period, median family income also increased in 1973 by 2.1 percent, in 1976 by 3.1 percent, and in 1978 by 2.3 percent.[2]

Increases in real median incomes were experienced by both White and Spanish-origin families in 1984. Their median incomes were $27,690 and $18,830, respectively. The median for Black families, $15,430, showed no statistically significant change from 1983.

Families maintained by women with no husband present had a median income of $12,800, 4.3 percent higher than in 1983. The median income of married-couple families was $29,610, up by about the same amount, 4.2 percent, over 1983.

Two-earner families now account for about 42 percent of all families. Their median income in 1984 was $31,710, 56 percent higher than the median of $20,290 for one-earner families, which now constitute 29 percent of all families.

The median income of families with a householder with 4 or more years of college rose by 2.2 percent in real terms to $43,170 in 1984. In contrast, families with a householder completing 4 years of high school experienced a 3.9-percent increase in median income;[3] their median, however, was $26,530, well below that of the college educated group.

EARNINGS OF PERSONS

The number of men and women with earnings rose substantially during 1984 as the number of employed Americans continued its expansion that began in 1983. The number of

[1]Changes in real income refer to comparisons after adjusting for inflation. The percentage change in prices between 1983 and 1984 was computed by dividing the annual average Consumer Price Index (CPI) for 1984 by the annual average value of the CPI for 1983. See table A-2 of appendix A for CPI's from 1947 to 1984.

[2]Changes in median income for the years 1976, 1978, and 1984 were not statistically different from one another. The difference between the 3.3-percent increase in 1984 and the 4.6-percent increase in 1972 was significant at the 90-percent confidence level.

[3]The difference between the 2.2-percent increase and the 3.9-percent increase was not statistically significant.

Table A. Comparison of Median Family Money Income in 1984 and 1983, by Selected Characteristics

Characteristic	Median family money income			Percent change in real money income
	1984	1983		
		Constant dollars	Current dollars	
All families	$26,433	$25,594	$24,549	*3.3
RACE OF HOUSEHOLDER				
White	27,686	26,814	25,719	*3.3
Black	15,432	15,150	14,532	1.9
Spanish origin[1]	18,833	17,627	16,907	*6.8
EDUCATION OF HOUSEHOLDER				
Elementary school	14,937	14,629	14,032	2.1
High school: 4 years	26,528	25,533	24,491	*3.9
College: 4 years or more	43,169	42,254	40,529	*2.2
NUMBER OF EARNERS				
None	11,377	10,833	10,391	*5.0
One	20,291	20,183	19,359	0.5
Two	31,707	31,046	29,779	*2.1
Three	39,828	38,856	37,270	*2.5
Four or more	50,278	49,711	47,682	1.1
TYPE OF FAMILY				
Married-couple families	29,612	28,429	27,268	*4.2
Wife in paid labor force	34,668	33,465	32,099	*3.6
Wife not in paid labor force	23,582	22,802	21,871	*3.4
Male householder, no wife present	23,325	22,697	21,770	2.8
Female householder, no husband present	12,803	12,270	11,769	*4.3

*Significant at the 95-percent confidence level.
[1]Persons of Spanish origin may be of any race.

men with earnings rose to 66.5 million, up 1.5 million over 1983, and the number of women with earnings rose by 2.1 million to 55.2 million.

The proportion of male workers working year round full time increased from 64 to 66 percent in 1984. The proportion for women remained at about 48 percent.

The median earnings of men and women working year round full time rose at about the same rate during 1984, both up about 2.0 percent from their 1983 levels. Men working year round full time had median earnings of $23,220 while the median for women was $14,780. The earnings level for women is 64 percent of the level for men, about the same as in 1983.

POVERTY STATUS

Reflecting the general improvement in the economy, the number of persons below the poverty level declined by 1.8 million to 33.7 million in 1984. During the same period the poverty rate fell from 15.3 to 14.4 percent. The decline in poverty was the first statistically significant decline since the 1975-76 period. The number of persons in poverty in 1977 was about the same as in 1976, but from 1978 to 1983, the number of poor persons increased from 24.5 to 35.5 million.

As shown in table B, the poverty rate declined for both Whites and Blacks between 1983 and 1984. The rate for Whites dropped from 12.2 to 11.5 percent, and the rate for

[1]Persons of Spanish origin may be of any race.
[r]Revised; see text for explanation.

Blacks fell from 35.7 to 33.8 percent. The number of Whites in poverty declined by 1.2 million. There was some evidence of a decrease in the number of low-income Blacks. No statistically significant changes were recorded in the number or percent of Spanish-origin persons in poverty.

There was a decline in the poverty rate among children under 18 years old (from 22.2 percent in 1983 to 21.3 percent in 1984). The rate among White children fell from 17.5 to 16.5 percent, but there were no significant changes in the rate among Black or Spanish-origin children. In 1984, the poverty rate among Black children was 46.5 percent and among children of Spanish origin 39 percent. Among persons 65 years old and over, both the number of persons in poverty and the poverty rate fell from 1983 to 1984. The number of elderly in poverty declined by 400,000 to 3.3 million in 1984, and the rate decreased by 1.8-percentage points to 12.4 percent.

Between 1983 and 1984, the total number of poor families declined as did the number of poor married-couple families. About 7.3 million families were below the poverty level in 1984 and 3.5 million of them were married-couple families; the comparable figures for 1983 were 7.7 and 3.8 million, respectively. There were 3.5 million poor families with a female householder, no husband present in 1984, not significantly different than in 1983. However, the poverty rate among these families decreased from 36.1 percent in 1983 to 34.5 percent in 1984. Families maintained by women accounted for 16 percent of all families and 48 percent of poor families in 1984. The poverty rate among unrelated individuals was 21.8 percent in 1984, compared with 23.5 percent in 1983. The decline in the poverty rate was significant for both male and female unrelated individuals. In 1984, 61 percent of all poor unrelated individuals were females.

Among the four major regions, both the number of persons below the poverty level and the poverty rate declined in the South and West Regions while the Northeast and Midwest Regions did not experience any significant changes. The poverty rate for the South was 16.2 percent, higher than any other region.

The estimates of poverty in this report are based solely on money income. The value of noncash benefits such as food stamps, Medicare, Medicaid, and public housing are not included as income for purposes of estimating the poverty population. Alternative estimates of the poverty population for 1984 based on an income definition that includes values for selected noncash benefits are shown in a separate report, Technical Paper 55, *Estimates of Poverty Including the Value of Noncash Benefits: 1984.*

REVISED SURVEY PROCEDURES

The note at the beginning of this report mentions revisions to survey procedures and estimation techniques introduced in the March 1985 CPS. The first was the change to a sample design based on the 1980 census. The second was the implementation of new survey weighting procedures for the Spanish population.

During the period from April 1984 through June 1985 the Bureau of the Census was systematically introducing a new sample design for the Current Population Survey. The purposes of this new sample design are to update the sampling frame to the 1980-census base, to improve survey efficiency, and to improve the quality of the survey estimates. By March 1985, approximately 60 percent of the sample was based on the new 1980-based sampling frame. Most geographic areas selected for the new sampling frame, about 80 percent, were also included in the 1970-based design.

Table C. Number of Persons and Persons Below the Poverty Level Based on Original and Revised Weighting Procedures: 1983

(Numbers in thousands. Persons as of March 1984)

Race or Spanish origin	Revised	Original	Difference revised minus original
ALL PERSONS

PERCENT BELOW THE POVERTY LEVEL			
Total	15.3	15.2	0.1
White	12.2	12.1	0.1
Black	35.7	35.7	-
Spanish origin[1]	28.1	28.4	-0.3

[1]Persons of Spanish origin may be of any race.

While the effect of the new sample design is small on estimates of income and poverty, its introduction has temporarily prevented the development of estimates for metropolitan, nonmetropolitan, farm, and nonfarm residence categories. Since the mixed 1970 and 1980-based sampling frame cannot provide figures that are comparable to either the 1970 or 1980 census definitions for these geographic areas, they have been omitted from this report. Publication of data by residence categories will resume when estimates can be derived using the full sample from the 1980-based survey design.

The estimates in this report for 1984 and 1983 are also based on revised survey weighting procedures for persons of Spanish origin. In previous years the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Spanish population. During the last several years, the Bureau of the Census has developed independent population controls for the Spanish population by sex and detailed age groups and revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, illegal immigrants.

The data in tables C and D illustrate the effect of introducing the new weighting methods by contrasting 1983 estimates based on the "original" and revised procedures. Overall, the revised procedures increased the Spanish population estimate from the survey by approximately 1.6 million. Since the original weighting procedures yielded underestimates of the number of Spanish and since Spanish have lower incomes, on average, than the total population, the net effects of the revised weighting were slightly lower median incomes and higher estimates of the poverty population overall for 1983. The estimates of the number of persons of Spanish origin below the poverty level increased by 392,000 following the revised procedures; however, their poverty rate declined slightly from 28.4 percent to 28.1 percent. The median income for males of Spanish origin was 3.9 percent lower based on the revised procedures.

Table D. Median Income of Families and Persons Based on Original and Revised Weighting Procedures: 1983

Characteristic	Revised	Original	Percent Difference
FAMILIES

[1]Since medians were calculated using more detailed intervals than those shown above, they will not be the same as those calculated using the above intervals.
[2]Persons of Spanish origin may be of any race.

Note: Beginning with the year 1979, percentages for intervals above $25,000 are based on more detailed group data and are not directly comparable to those for earlier years.

[1]Since medians were calculated using more detailed intervals than those shown above, they will not be the same as those calculated using the above intervals.
[2]Persons of Spanish origin may be of any race.

Note: Beginning with the year 1979, percentages for intervals above $25,000 are based on more detailed group data and are not directly comparable to those for earlier years.

Table 4. Number of Families and Unrelated Individuals, Income at Selected Positions, and Percentage Share of Aggregate Income in 1984 Received by Each Fifth and Top 5 Percent of Families and Unrelated Individuals, by Race of Householder and Region

(Families and unrelated individuals as of March 1985)

[1]Beginning with 1979, includes members of unrelated subfamilies not shown separately. For earlier years, unrelated subfamily members are included in the 'in families' catagories.
[2]Persons of Spanish origin may be of any race.
[3]Includes female unrelated individuals.
[4]Includes male unrelated individuals.

Note: Beginning with 1979, data are based on 1980 census population controls.

Table 16. Persons Below 125 Percent of the Poverty Level, by Family Status, Type of Family, Race, and Spanish Origin: 1970 and 1980 to 1984

Appendix A. Definitions and Explanations

under 65 – 4290
over 65 3949

Population coverage. This report includes the civilian noninstitutional population of the United States (the 50 States and the District of Columbia) and members of the Armed Forces living off post or with their families on post, but excludes all other members of the Armed Forces.

Money income. Income distributions and income summary measures (such as medians and means) shown in this report are limited to money income before payment of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions, such as union dues and Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income which was regularly received. Capital gains (or losses) and lump sum or onetime payments such as life insurance settlements are excluded.

Underreporting. As in most household surveys, the estimates of the number of money income recipients and the total amount of money income derived from the March CPS are somewhat less than comparable estimates derived from independent sources, such as the Bureau of Economic Analysis, Social Security Administration, and Veterans Administration. The difference between the survey estimate and the independent estimate is generally termed "underreporting." Underreporting tends to be more pronounced for income sources such as public assistance and welfare, unemployment compensation, and property income (interest, dividends, and net rental income). Estimates of income from wages and salaries tend to have less underreporting than most income types. For further details concerning the reporting of money income, see "Appendix C. Underreporting of Income."

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI). **The average poverty threshold for a family of four was $10,609 in 1984, about 4.2 percent higher than the comparable 1983 cutoff of $10,178.** Weighted average poverty thresholds by size of family are shown in table A-1. For further details, see Current Population Reports, Series P-60, No. 147.

Table A-1. Weighted Average Poverty Thresholds in 1984

Size of family unit	Threshold
One person (unrelated individual)...	$ 5,278
15 to 64 years.....	5,400
65 years and over.....	4,979
Two persons.....	6,762
Householder 15 to 64 years.....	6,983
Householder 65 years and over.....	6,282
Three persons.....	8,277
Four persons.....	10,609
Five persons.....	12,566
Six persons.....	14,207
Seven persons.....	16,096
Eight persons.....	17,961
Nine persons or more.....	21,247

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group

of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit or a group of unrelated persons sharing a housing unit as partners is also counted as a household. The count of households excludes group quarters.

Family. The term "family" refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered members of the same family. Thus, if the son of the householder and the son's wife are in the household, they are treated as part of the householder's family. However, a lodger and his wife not related to the householder or an unrelated servant and his wife are considered as additional families, not a part of the householder's family. These unrelated subfamilies are not included in the count of total families.

Unrelated individuals. The term "unrelated individuals" refers to persons 15 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters (such as a rooming house). Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

The estimates are based on data obtained annually in March of 1948 through 1985 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and over in every sample household. In addition, supplementary questions are asked every March about money income and work experience for the previous year. In order to obtain more reliable data for the Spanish population, the March CPS sample was enlarged to include all households from the previous November which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

CPS DESIGN PHASE-IN

Since the inception of the CPS in 1940, the sample has been redesigned several times, most recently in the early 1970's, to upgrade the quality and reliability of the data and to meet changing data needs. During the period from April 1984 through June 1985 a new sample design was phased in. The March 1985 CPS sample consists of three rotation groups from the 1970 census-based sampling frame, four rotation groups from the 1980 census-based sampling frame, and one rotation group from both sampling frames. The coverage was in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. Due to the phase-in of the new design, the March 1985 CPS sample had three rotation groups located in 629 sample areas comprising 1,148 counties, independent cities, and minor civil divisions and five rotation groups located in 729 sample areas representing 1,973 counties and equivalent geographic areas in the United States. This current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. In this sample, approximately 59,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. A description of the previous CPS sample design and a more detailed explanation of the effects of the phase-in procedure on the March 1985 data will appear in the forthcoming detailed reports on money income and poverty in 1984 in the P-60 Series.

The estimation procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Spanish origin. The estimation procedure also involved a further adjustment so that husband and wife of a household received the same weight. These independent estimates are based on statistics from the decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. Beginning with reports containing income data for 1980, the independent population estimates used to obtain data for years 1979 and later are based on the 1980 census. In earlier reports in this series (P-60), data for 1971 through 1979 were obtained using independent population estimates based on the 1970 decennial census. For more details on this change, see the section of the text, "Introduction of 1980 Census Population Controls," Series P-60, No. 132.

RELIABILITY OF ESTIMATES

Since the CPS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. Bias is the difference, averaged over all possible samples, between the estimate and the desired value. Obviously, the accuracy of a survey result depends on the sampling and nonsampling errors measured by the standard error and on the bias and other types of nonsampling error not measured by the standard error. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Sampling variability. The standard errors that may be obtained using this appendix are primarily measures of sampling variability; that is, of the variation that occurred by chance

because a sample rather than the entire population was surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals—ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses are 1) the population parameters are identical or 2) they are different. An example of this would be comparing the mean annual income of men versus the mean annual income of women. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is at least twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement

Table B-1. Parameters for Direct Computation of Standard Errors of Estimated Numbers and Percentages of Households, Families, Unrelated Individuals, and Persons: 1966 to 1984

All races or White	-0.000009	1,885
Black and/or other races	-0.000077	2,155
Spanish origin	-0.000294	3,363
Families below poverty level:		
All races or White	0.000076	1,876
Black and/or other races	0.000076	1,876
Spanish origin	-0.000237	2,713
Persons below poverty level:		
All races or White	-0.000031	7,946
Black and/or other races	-0.000270	7,946
Spanish origin	-0.001131	12,923

Note: For years prior to 1966, a standard error estimate computed with these parameters must be adjusted. For 1947 to 1954, multiply the standard error by 1.8; for 1955 to 1964, multiply by 1.4; and for 1965 multiply by 1.2.

of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

COMPARABILITY OF DATA

Caution should be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to those for 1970 through 1979 which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures, such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionally greater for certain subpopulation groups than for the total population.

Previously, the only postcensal figures for the size of the Spanish population came from the CPS itself (i.e., the old procedure did not have a separate population control for Hispanics). These figures proved to be too low relative to the census and not stable over time. The new CPS procedure for Hispanics makes use of independent postcensal estimates of the Spanish population as control totals to solve these problems. One consequence of the use of the new procedure is that besides the expected increase in the levels of the Spanish population, there were increases in the levels of persons and families below poverty. Thus, this change in procedure will affect comparisons across years; and caution should be used when comparing current estimates with those for earlier years. The data for 1983 were retabulated using the new procedure. Thus year-to-year change from 1983 to 1984 uses the new Spanish controls. Data for earlier years were not retabulated.

Note when using small estimates. Summary measures (such as means, medians, percent distributions, and poverty rates) are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

STANDARD ERRORS OF ESTIMATED NUMBERS AND PERCENTAGES

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic. Since this is an advance report, standard error parameters are provided in table B-1 for estimated numbers and estimated percentages of households, families, unrelated individuals, and persons for only certain characteristics which are considered the most important among the data in the report.

Standard errors of estimated numbers and estimated percentages can be computed directly with formulas (1) and (2), respectively. The formulas are

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (1)$$

Here, x is the size of the estimate and a and b are the parameters associated with the characteristic.

$$\sigma(x,p) = \sqrt{\frac{b}{x} \cdot p \cdot (100 - p)} \qquad (2)$$

Here, x is the size of the subclass of the population which is the base of the percentage, p is the percentage ($0 < p < 100$), and b is the parameter associated with the characteristic.

Standard error of a difference. The formula for the standard error of the difference between two estimates x and y, is given by

$$\sigma(x-y) = \sqrt{\sigma_x^2 + \sigma_y^2 - 2\varrho\, \sigma_x\, \sigma_y} \qquad (3)$$

where σ_x and σ_y are the standard errors of the estimates x and y, and ϱ represents the correlation between the two estimates.

For the year-to-year comparisons of income and poverty estimates the correlation coefficients, ϱ, are contained in the detailed reports in this series, (Current Population Reports, Series P-60, Nos. 146 and 147). For other comparisons, assume ϱ equals zero. Making this assumption will result in accurate estimates of the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Appendix C. Underreporting of Income

This appendix discusses some important aspects of income underreporting and its measurement, and presents some estimates of underreporting for the base year 1983. The general survey phenomenon that is commonly termed underreporting actually refers to the tendency of household surveys to underestimate the number of income recipients and/or the amount of income received. There are three main aspects of underreporting. These are failure to report receipt of the income type, underreporting of the amount received, and misclassification of the income type received.

Accurately measuring the extent of underreporting of cash income is difficult for many of the income types. There are two main components of measuring underreporting: the number of income recipients and the total amount of income received. Measuring the survey undercount of recipients for the March CPS is extremely difficult because independent estimates (benchmarks or controls) for the CPS noninstitutional, "ever-received during the year" recipient concept are difficult to validate. In addition, some of the administrative sources required for the derivation of independent estimates have significant errors themselves.

The derivation of accurate underreporting estimates for amounts of income is easier but still not without similar problems. In general, better administrative data are available for the annual amount of income received, than for the number of recipients. Some of the more important problems associated with development of the independent controls for amounts are adjusting independent estimates to the CPS income concept, significant differences between alternate sources of independent estimates for the same income type, especially for self-employment income, interest, dividends, and rents, and periodic revisions to the sources of independent estimates that delay availability of data and significantly alter estimates of underreporting. Table C-1 shows estimates of underreporting for amounts of aggregate income in 1983 by income type.

Table C-1. Comparisons of CPS Aggregate Money Income in 1983 With Independently Derived Estimates, by Income Type

(Billions of dollars)

Source of income	Independent estimate	CPS estimate	CPS as a percent of independent
Total	2,402.5	2,164.9	90.1
Wages and salaries	1,632.3	1,616.3	99.0
Self-employment	112.6	130.1	115.5
Social Security[1]	155.2	142.3	91.7
Supplemental Security Income	9.0	7.6	84.9
Aid to Families with Dependent Children	13.8	10.5	76.0
Interest, dividends, and rental income	315.4	143.2	45.4
Veterans' payments	14.0	8.8	63.3
Unemployment compensation	26.1	19.7	75.5
Workers' compensation	14.1	6.6	47.0
Private, government, and military pensions	110.1	79.7	72.4
