Money Income and Poverty Status of Families and Persons in the United States: 1986 (Advance Report)

INTRODUCTION

This report presents data on the income and poverty status of families and persons in the United States for the calendar year 1986. These data were compiled from information collected in the March 1987 Current Population Survey (CPS) conducted by the Bureau of the Census. The survey consisted of 60,500 households nationwide and was designed mainly to produce reliable national estimates, though some data by region and metropolitan residence were also compiled and appear in this report. The estimates in this report represent the government's official annual poverty estimates.

HIGHLIGHTS

- For the fourth consecutive year, median family income moved ahead of inflation. In 1986, the median income for families was $29,460, 4.2 percent higher than the 1985 median after adjusting for a 1.9 percent increase in consumer prices between 1985 and 1986.[1]
- Since 1982, when the last economic recession ended, real median family income rose a total of 10.7 percent.
- The median earnings of both men and women working year-round, full-time increased significantly in real terms between 1985 and 1986.
- The number of persons below the poverty level was 32.4 million in 1986.[2] The difference between the 1986 figure and the 1985 estimate of 33.1 million was not statistically significant.
- The poverty rate was 13.6 percent in 1986, compared with 14.0 in 1985. The percent change was significant at the 90-percent level of confidence but not at the 95-percent level.
- The number and percentage of persons in poverty have declined since the recent peak level of 1983, when the number of persons in poverty was 35.3 million and the poverty rate was 15.2 percent.

FAMILY INCOME

In 1986, median family income was $29,460, 4.2 percent higher than the 1985 median of $27,740 after adjusting for inflation. The increase in 1986 was preceded by annual increases of 1.3 percent in 1985, 2.8 percent in 1984, and 1.6 percent in 1983[3] and was one of the largest increases since 1972. The increase of 1.6 percent in real family income for 1983 marked the first rise in income following the most recent recessionary period lasting from mid-1981 thru the latter part of 1982. Since 1982, real median family income increased by 10.7 percent. These recent increases have brought real median family income to a level comparable to that of 1978.

Examining changes in median family income during the 1960's and 1970's provides some perspective on the changes experienced thus far in the 1980's. During the 1960-70, period median family income rose an average of 3.0 percent per year. Statistically significant real annual increases occurred in 8 of the 10 years during this period. Between 1970 and 1980, median family income registered four real annual increases and three real annual declines, resulting in an average annual growth rate not statistically different from zero. Since 1980, median family income has risen an average of 0.8 percent per year. This rate reflects the average annual decline of 2.4 percent per year during the 1980-82 period and the 2.5 percent per year increase since 1982. (See figure 1.)

Real median income of married-couple families rose 3.5 percent between 1985 and 1986 to a level of $32,810, while the income of families with a female householder, no husband present ($13,650) showed no statistically significant change. Since 1982, the median income of married-couple families rose 11.0 percent and female householder families with no husband present experienced an increase in median income of 4.6 percent. (See table A.)

Median income of White married-couple families increased by 3.8 percent between 1985 and 1986, Hispanic married-couple families by 5.4 percent, and Black married-couple families by 6.2 percent.[4] White, Hispanic, and Black married-couple families have all shown a significant increase in real income since 1982—gains of 11.3 percent, 8.9 percent, and

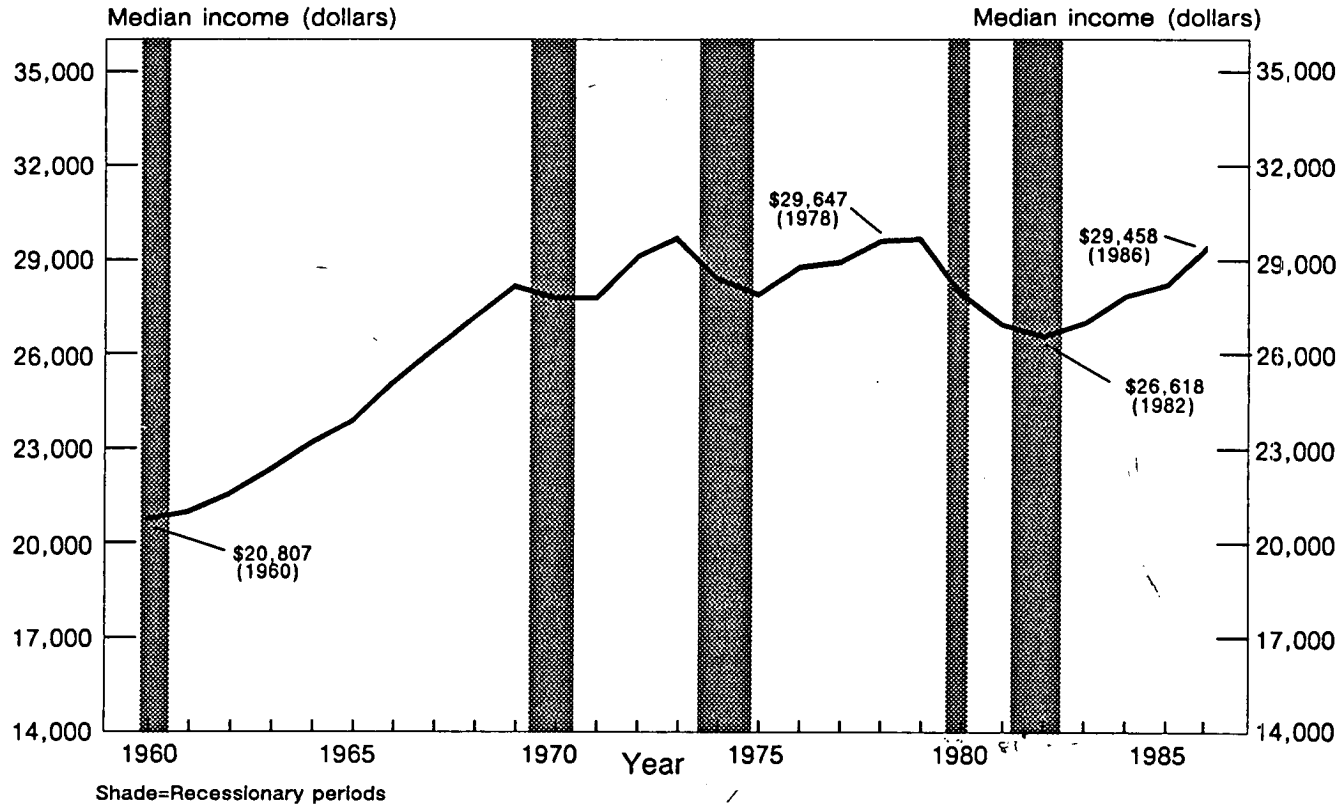
[1]Changes in real income refer to comparisons after adjusting for inflation. The percentage change in prices between 1985 and 1986 was computed by dividing the annual average Consumer Price Index for all urban consumers (CPI-U) for 1986 by the annual average for 1985. See table A-2 of appendix A for the CPI's from 1947 to 1986.

[2]Poverty statistics exclude inmates of institutions, Armed Forces members in barracks, college students living in dormitories and unrelated individuals under 15 years of age. Such persons are also excluded from the denominator when calculating poverty rates.

[3]The percent change in median income between 1984 and 1985 was not significantly different from the 1982-83 or the 1983-84 change.

[4]The differences between the percentage increases for White, Black, and Hispanic family incomes were not statistically significant.

Figure 1.
Median Family Income: 1960 to 1986
(In 1986 dollars)



13.7 percent, respectively.[4] For families with a female householder, no husband present, only Blacks showed a statistically significant change (+9.8 percent) in real median income, since 1982.

Regionally, real median income increased for families in the Northeast (3.3 percent), Midwest (3.9 percent), and the South (4.5 percent) between 1985 and 1986.[5] The West showed no statistically significant change. All four regions have shown a real income gain since 1982 ranging from 7.5 percent in the Midwest to 13.6 percent in the Northeast.

EARNINGS OF YEAR-ROUND, FULL-TIME WORKERS

Both men and women posted gains in real median earnings between 1985 and 1986. For men, 1986 median earnings were $25,260, up 2.4 percent. For women, real median earnings rose 1.9 percent to a level of $16,230.[6] (See table 7.) Since 1982, the gain in real earnings for women has been larger than for men. Between 1982 and 1986 women's median earnings rose by 9.8 percent. This increase compares with a 5.5 percent increase in men's earnings.

In 1986, 66.8 percent of civilian male workers and 49.2 percent of civilian female workers worked year-round, full-time. Both of these percentages were unchanged from 1985. Since 1982, these proportions have risen significantly from levels of 61.9 percent for men and 45.6 percent for women.

PER CAPITA INCOME

In 1986, per capita income was $11,670, up 4.0 percent from 1985 in real terms. Per capita incomes in 1986 for Whites, Blacks, and Hispanics were $12,350, $7,210, and $7,000, respectively, all higher than in 1985 in real terms.[7]

The 1982 to 1986 period following the last recession saw per capita income increase by 14.4 percent overall. This rise is somewhat greater than the rise in median family income for the same period. Between 1970 and 1980, real per capita income rose 15.5 percent while real median family income showed no significant change.

Per capita income is computed by dividing the total aggregate money income by the total population. Basically, it is the amount of income per person, for every man, woman, and child in the CPS noninstitutional population. Per capita

[5]The differences between the percentage increases in income by region were not statistically significant.

[6]The difference between the percentage increases in men's and women's earnings was not statistically significant.

[7]The difference between the per capita incomes of Blacks and Hispanics was not statistically significant. The percent increase in per capita income of Blacks and Hispanics was significant at the 90-percent confidence interval.

*Significant at the 95-percent confidence level.

[1]Persons of Hispanic origin may be of any race.

income differs from family income in that it includes the income of all persons whereas family income is restricted to the income of related persons living in households. Changes in family income do not, therefore, reflect the changes in income for other segments of the population, such as unrelated individuals, or the fact that the characteristics of families are changing. Changes in living arrangements, such as declines in average family size or decreases in the proportion of families maintained by married couples, can affect the measurement of family income. Use of per capita income provides a measure that includes all population segments and that is less affected by changes in living arrangements.

POVERTY STATUS

The number of persons in poverty was 32.4 million in 1986 and the poverty rate was 13.6 percent. The number of poor in 1986 was not statistically different from the 1985 figure, but was below the recent peak of 35.3 million recorded in 1983.[8] The 1986 poverty rate of 13.6 percent was lower than the 1985 rate of 14.0 percent at the 90-percent confidence level but not at the 95-percent level. The poverty rate was 15.2 percent in 1983.[8]

Poverty data using the official government definition were first tabulated for 1959. The poverty rate fell dramatically in the 1960's, decreasing from 22 percent to 12 percent in 1969. (See figure 2.) During the same period, the number of poor declined from 39.9 million to 24.1 million. (See figure 3.) During the period 1970 to 1977, the size of the poverty population fluctuated between 23 and 26 million, and the poverty rate was in the 11 to 13 percent range. From 1978 to 1983, the number of persons in poverty increased by 44 percent, from 24.5 to 35.3 million, and the poverty rate rose from 11 to 15 percent.

The poverty definition used here is that adopted for official government use by the Office of Management and Budget and consists of a set of money income thresholds that vary by family size and composition. Families or individuals with income below their appropriate thresholds are classified as below the poverty level. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index. For example, the average poverty threshold for a family of four was $11,203 in 1986, $10,989 in 1985 and $10,609 in 1984.

[8]Although the last recession ended in the latter part of 1982, the number of poor did not peak until the following year. There was no significant difference between the poverty rates for 1982 and 1983.

[1]Persons of Hispanic origin may be of any race.

The estimates of poverty in this report are based solely on money income. The value of noncash benefits such as food stamps, Medicare, Medicaid, public housing, and employer-provided fringe benefits are not included as income in the government's poverty concept.[9] For a further discussion of valuing noncash benefits and poverty, see the section discussing experimental estimates of poverty.

Whites represented 69 percent of the poor in 1986, Blacks represented 28 percent, and the remainder were persons of other races (principally Asians and American Indians). The poverty rate in 1986 was 11 percent for Whites, 31 percent for Blacks, and 16 percent for persons of other races. The poverty rate for persons of Hispanic origin (who may be of any race) was 27 percent in 1986. Neither the number of poor nor the poverty rate changed significantly for Whites, Blacks, or persons of other races between 1985 and 1986. Among Hispanics, the number in poverty did not change between 1985 and 1986, but their poverty rate declined from 29 percent to 27 percent.

The poverty rate for Whites has declined since 1983 (the rate in that year was 12 percent), but the 1986 rate was higher than the 1978 rate of 9 percent (1978 was a recent low-point in the poverty rate).[10] Among Blacks, the 1986 poverty rate was lower than the 1983 figure of 36 percent and was at about the same level as the 1978 rate. The 1986 rate among persons of Hispanic origin was not statistically different from the 1983 rate but was well above the 1978 rate of 22 percent.

The number of poor and the poverty rates in the Northeast and Midwest regions declined between 1985 and 1986,[11] but there were no significant changes in the South or West. Each of the four regions had a 1986 poverty rate that was lower than the 1983 rate.[12]

[9]The Census Bureau's income concept does not assign a value to any noncash benefit, regardless of the person's or family's income level. Benefits such as employer-provided health and life insurance, pension plans, stock options, paid vacations, and use of company automobiles are not valued and not included as income.

[10]The poverty rate in 1978 was not statistically different from the rates of the surrounding years 1977 and 1979.

[11]The change in the poverty rate for the Midwest was significant at the 90-percent but not the 95-percent confidence level.

[12]The change in the poverty rates for the South and West were significant at the 90-percent but not the 95-percent confidence level.

*Significant at the 95-percent confidence level.
**Significant at the 90-percent confidence level.
[1]Persons of Hispanic origin may be of any race.

The number of poor families in 1986 was about 7 million, not significantly different from the 1985 figure. About 44 percent of poor families were composed of married-couple families and 51 percent were composed of families with a female householder, no husband present. The number of poor married-couple families decreased from 3.4 to 3.1 million between 1985 and 1986, but the number of poor families maintained by a woman with no husband present did not change significantly.

The number of poor families has decreased since 1983, when there were about 7.6 million, as has their poverty rate (12 percent in 1983; 11 percent in 1986). Similarly the number of married-couple families below the poverty level decreased during the 1983-86 period, from 3.8 to 3.1 million and their poverty rate dropped from 8 to 6 percent. The number of poor families with a female householder and no spouse present was about 3.6 million in both 1983 and 1986, and their poverty rate was about 35 percent in both years.

Persons in families represented 76 percent of the poor in 1986 and persons living alone or with nonrelatives represented 21 percent (persons in unrelated subfamilies made up the remainder of the poverty population). Between 1985 and 1986, the number of family members in poverty declined by about 1 million but the number of poor unrelated individuals did not change significantly. Between 1983 and 1986, the number of poor family members declined by 3.2 million, but the number of poor unrelated individuals showed no statistically significant change.

The poverty rate in 1986 was about 20 percent for related children under 18 years old in families and 12 percent for persons 65 years and over. These rates were not statistically different from the 1985 rates, but were lower than the 1983 rates (22 percent and 14 percent, respectively).

The 1986 poverty rate was higher in central cities of metropolitan areas and in nonmetropolitan areas (both about 18 percent) than in suburban areas (about 8 percent). The poverty rate in central cities declined from 19 percent in 1985, while the rates for suburban and nonmetropolitan areas did not change significantly. The number of poor in central cities declined by about 900,000 between 1985 and 1986.

One-half of poor family householders worked at some time during 1986, and 17 percent worked year-round, full-time. Neither of these proportions changed between 1985 and 1986.

In 1986, the average amount of additional money needed to raise the incomes of poor families above their respective poverty threshold was about $4,400. For unrelated individuals the comparable figure was about $2,500.

EXPERIMENTAL ESTIMATES OF POVERTY

For the past several years the Bureau of the Census has provided experimental estimates of poverty based on income definitions that include the value of selected noncash benefits, using different methods of valuing such benefits. Since the same poverty thresholds were used as in the official definition, the resulting poverty estimates, which are exploratory in nature, are all lower than the official estimates. The latest series of these estimates are published in Technical Paper 57, *Estimates of Poverty Including the Value of Noncash Benefits: 1986.*

Table 1. Median Income of Families by Selected Characteristics, Race, and Hispanic Origin of Householder: 1986 and 1985

(Families as of March of the following year. An asterisk (*) preceding percent change indicates statistically significant change at the 95-percent confidence level; two asterisks (**) indicates significance between the 90- and 95-percent confidence level. For meaning of symbols, see text)

Table 15. Number, Poverty Rate, and Standard Errors for Persons, Families, and Unrelated Individuals Below the Poverty Level in 1986 and 1985

(Numbers in thousands. Persons, families, and unrelated individuals as of March of the following year. An asterisk (*) preceding number and poverty rate difference indicates statistically significant change at the 95-percent confidence level; two asterisks (**) indicates significance between the 90- and 95-percent confidence level. For meaning of symbols, see text)

[1]Beginning with 1979, includes members of unrelated subfamilies not shown separately. For earlier years, unrelated subfamily members are included in the 'in families' catagories.
[2]Persons of Hispanic origin may be of any race.
[3]Includes female unrelated individuals.
[4]Includes male unrelated individuals.

[1]Beginning with 1980, includes members of unrelated subfamilies not shown separately. For 1970, unrelated subfamily members are included in the 'in families' catagories.
[2]Persons of Hispanic origin may be of any race.
[3]Includes female unrelated individuals.
[4]Includes male unrelated individuals.

Note: Beginning with 1980, data are based on 1980 census population controls.

[2]Includes female unrelated individuals.
[3]Includes male unrelated individuals.
[4]Includes unrelated subfamilies.

Appendix A. Definitions and Explanations

Population coverage. This report includes the civilian noninstitutional population of the United States (the 50 States and the District of Columbia) and members of the Armed Forces living off post or with their families on post, but excludes all other members of the Armed Forces.

Money income. Income distributions and income summary measures (such as medians and means) shown in this report are limited to money income before payment of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions, such as union dues and Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income which was regularly received. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Per capita income. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

Constant dollars. Some of the income figures for previous years have been converted to 1986 constant dollars in order to discount for changes in consumer prices. These adjustments were made based on changes in the average annual Consumer Price Index for All Urban Consumers (CPI-U). These indexes are shown in table A-2.

Nonresponse. Nonresponse in household surveys has two main components. The first, often termed noninterview, consists of those occupied sample housing units for which no interview was obtained. In the March CPS, about 4-to-5 percent of all sample households are determined to be noninterviews. Noninterviews result because the household members refuse to participate in the survey or because the occupants could not be found at home at any time during the survey week. The survey weights of the interviewed households are adjusted to reflect the loss of these noninterviews. The second component of nonresponse, usually referred to as item nonresponse, represents failure to obtain answers to specific questions for households that do participate in the survey. Item nonresponse occurs because individuals may refuse to answer some questions or because the answers to some of the questions are not known and cannot be accurately estimated by the respondent. The magnitude of item nonresponse for amounts of income received varies considerably by the type of income. For example, the item nonresponse rate for wage and salary amounts was about 17 percent, compared with 19 percent for Social Security income and 28 percent for interest income. The data processing system used for the March CPS makes assignments (imputes) of values when survey responses are missing. These imputations are made on a case-by-case basis using the respondent's reported information to develop an appropriate substitute value.

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI). The average poverty threshold for a family of four was $11,203 in 1986, about 1.9 percent higher than the comparable 1985 cutoff of $10,989. Weighted average poverty thresholds by size of family are shown in table A-1.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

Table A-1. Weighted Average Poverty Thresholds in 1986

Size of family unit	Threshold
One person (unrelated individual)	$ 5,572
15 to 64 years	5,701
65 years and over	5,255
Two persons	7,138
Householder 15 to 64 years	7,372
Householder 65 years and over	6,630
Three persons	8,737
Four persons	11,203
Five persons	13,259
Six persons	14,986
Seven persons	17,049
Eight persons	18,791
Nine persons or more	22,497

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit or a group of unrelated persons sharing a housing unit as partners is also counted as a household. The count of households excludes group quarters.

Family. The term "family" refers to a group of two or more persons (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered members of the same family. Thus, if the son of the householder and the son's wife are in the household, they are treated as part of the householder's family. However, a lodger and his wife not related to the householder or an unrelated servant and his wife are considered as additional families, not a part of the householder's family. These unrelated subfamilies are not included in the count of total families.

Unrelated individuals. The term "unrelated individuals" refers to persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Table A-2. Annual Average Consumer Price Index (CPI): 1947 to 1986

(1977 = 100)

Year	CPI	Year	CPI
1947	36.9	1967	55.1
1948	39.7	1968	57.4
1949	39.3	1969	60.5
1950	39.7	1970	64.1
1951	42.9	1971	66.8
1952	43.8	1972	69.0
1953	44.1	1973	73.3
1954	44.4	1974	81.4
1955	44.2	1975	88.8
1956	44.8	1976	93.9
1957	46.4	1977	100.0
1958	47.7	1978	107.7
1959	48.1	1979	119.8
1960	48.9	1980	136.0
1961	49.4	1981	150.1
1962	49.9	1982	159.3
1963	50.5	1983	164.4
1964	51.2	1984	171.4
1965	52.1	1985	177.5
1966	53.6	1986	180.9

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

The estimates in this report are based on data obtained annually in March of 1961 through March 1987 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, supplementary questions are asked every March about money income and work experience for the previous year. In order to obtain more reliable data for the Hispanic population, the March CPS sample was enlarged to include all households from the previous November which contained at least one sample person of Hispanic origin. For this report, persons in the Armed Forces living off post or with their families on post are also included.

Current Population Survey (CPS). The present CPS sample was selected from the 1980 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 60,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

CPS estimation procedure. The estimation procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, sex, race, and Hispanic/non-Hispanic categories. These independent estimates are based on statistics from the decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. Beginning with reports containing income data for 1980, the independent population estimates used to obtain data for years 1979 and later are based on the 1980 census. Data for 1979 in earlier reports were obtained using independent population estimates based on the 1970 decennial census.

RELIABILITY OF ESTIMATES

Since the CPS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the estimate and the desired value.)

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability; that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals—ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypotheses appearing in this report is that the population parameters are different. An example of this would be

comparing the median annual income of Black families versus the median annual income of White families. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. Let the standard error on the difference x-y be S_{DIFF}. If the ratio $R = (x-y)/S_{DIFF}$ is between - 2 and + 2, no conclusion about the difference between the characteristics is justified at the 0.05 level of significance. If, on the other hand, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the characteristics are different. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 5 percent chance of concluding that they are different. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between characteristics is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between characteristics is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison is qualified, e.g., by use of the phrase "some evidence."

Comparability of data. Income and poverty estimates for 1985 are the first based entirely on households selected from the 1980 census-based sample design. Estimates by type of residence categories such as metropolitan, nonmetropolitan, farm and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and 1980 census sampling frame used for the March 1985 CPS, have been resumed. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 CPS income supplement was revised to allow the coding of larger earnings amounts on the questionnaire.

Caution should be used when comparing 1984-85 income year with the 1985—86 income year because of the change in population controls between the 1970 and 1980 designs. The combination of the phase-out of the 629 sampling areas obtained by sampling from the 1970 census materials and the phase-in of the 729 sampling areas obtained by sampling from the 1980 census materials means that the current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 130).

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs. Also, care must be taken in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

STANDARD ERRORS OF ESTIMATED NUMBERS AND PERCENTAGES

Since this is an advance report, standard error parameters are provided in table B-1 for estimated numbers and estimated percentages of households, families, unrelated individuals, and persons for only certain characteristics which are considered the most important among the data in the report.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic. Direct computation of the standard errors will give more accurate results than the use of standard error tables.

Standard errors of estimated numbers and estimated percentages can be computed directly with formulas (1) and (2), respectively. The formulas are

$$S_x = \sqrt{ax^2 + bx} \qquad (1)$$

Table B-1. Parameters for Direct Computation of Standard Errors of Estimated Numbers and Percentages of Households, Families, Unrelated Individuals, and Persons: March 1980 to 1987

(Total persons 14 years and over)

Characteristic	Parameters	
	a	b
Number of households, families, and unrelated individuals:		
Total or non-Black	-0.000008	1,896
Black	-0.000058	2,067
Hispanic origin	-0.000121	2,067
Number of persons:		
Total or non-Black	-0.000011	2,077
Black	-0.000092	2,374
Hispanic origin	-0.000189	2,374
Families below poverty level:		
Total or non-Black	0.000084	2,067
Black	0.000084	2,067
Hispanic origin	0.000084	2,067
Persons below poverty level:		
Total or non-Black	-0.000052	9,628
Black	-0.000375	9,628
Hispanic origin	-0.000768	9,628

Note: For years prior to 1980, apply these factors to the parameters to obtain the standard errors. For 1947 to 1954, multiply the standard error by 1.6; for 1955 to 1964, multiply by 1.3; for 1965, multiply by 1.1, and for 1966 to 1979 multiply by 0.9.

Here, x is the size of the estimate and a and b are the parameters associated with the characteristic.

$$S_{(x,p)} = \sqrt{(b/x)\ (p)\ (100-p)} \qquad (2)$$

Here, x is the size of the subclass of the population which is the base of the percentage, p is the percentage ($0<p<100$), and b is the parameter associated with the characteristic.

Table B-1 provides the values of the a and b parameters that are used in formulas (1) and (2) to create standard errors of estimated numbers and estimated percentages of households, families, unrelated individuals, and persons.

Standard error of a difference. The formula for the standard error of the difference between two estimates x and y, is given by

$$S_{(x-y)} = \sqrt{S_x^2 + S_y^2 - 2r\ S_x\ S_y} \qquad (3)$$

where S_x and S_y are the standard errors of the estimates x and y, and r represents the correlation between the two estimates.

For the year-to-year comparisons of income and poverty estimates the correlation coefficients, r, are contained in the detailed reports in this series, (Current Population Reports, Series P-60, Nos. 151 and 152). For other comparisons, assume r equals zero. Making this assumption will result in accurate estimates of the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Appendix C. Underreporting of Income

In general, estimates of the number of income recipients and amounts derived from household surveys are somewhat less than comparable estimates derived from independent sources based on administrative records such as tax returns, W-2 forms, Social Security benefit records, etc. This underestimation is commonly referred to as "underreporting." There are three main causes for income underreporting in surveys: 1) failure to report receipt of a specific income type, 2) reporting an amount that was less than the actual amount received, and 3) reporting the source of income incorrectly.

Measuring the magnitude of underreporting in the March CPS is difficult, especially for some income types. First, to estimate underreporting of recipients an independent estimate of persons receiving the income source at any time during the calendar year must be calculated. While data on income recipients by month are available for many government benefit programs, no data are available for a calendar-year period. Since the "turnover" in some programs such as Aid to Families with Dependent Children and unemployment compensation is significant, it is difficult to derive a calendar-year recipient estimate from these monthly administrative sources. Second, estimates available from administrative sources must be adjusted to the CPS universe (noninstitutional population). Third, certain administrative sources are also subject to errors. For example, tax filers tend to underreport income on tax returns, therefore, establishing benchmarks based on tax return data would not capture the full extent of underreporting. Also, not all persons are required to file tax returns.

Because it is easier to compute independent estimates of the total amount of income received than the number of income recipients, most estimates of underreporting are based on comparisons of aggregate income amounts derived from independent sources and survey data. This method of measuring underreporting combines the effects of all underreporting causes listed earlier. This method is not without problems, however. There are, for instance, significant differences between sources of independent estimates for the same income type, especially for self-employment, interest, dividends, and rental incomes. Also, some independent estimates, such as the Bureau of Economic Analysis' personal income series, undergo revisions thereby substantially altering the measures of underreporting.

Since the derivation of independent estimates is a significant undertaking, it is only attempted periodically. The last detailed effort for the March CPS was completed for 1983. A summary of the underreporting for key income sources is shown in table C-1. Overall, the level of CPS underreporting was about 10 percent, however, the level varied widely between individual types of income. Underreporting tends to be more pronounced for public assistance, unemployment and workers' compensation, and property income. The apparent survey overestimation for self-employment income reflects the difficulty in developing comparable independent figures.

Finally, various population subgroups receive a higher proportion of their total income from certain income sources, such as interest and dividends for the elderly and public assistance for female-family householders. The differential underreporting between income types, therefore, affect the estimates of some population subgroups more than others.

Table C-1. Comparisons of CPS Aggregate Money Income in 1983 with Independently Derived Estimates, by Income Type

(Billions of dollars)

Source of income	Independent estimate	CPS estimate	CPS as a percent of independent
Total	2,402.5	2,164.9	90.1
Wages and salaries	1,632.3	1,616.3	99.0
Self-employment	112.6	130.1	115.5
Social Security[1]	155.2	142.3	91.7
Supplemental Security Income	9.0	7.6	84.9
Aid to Families with Dependent Children	13.8	10.5	76.0
Interest, dividends, and rental income	315.4	143.2	45.4
Veterans' payments	14.0	8.8	63.3
Unemployment compensation	26.1	19.7	75.5
Workers' compensation	14.1	6.6	47.0
Private, government, and military pensions	110.1	79.7	72.4

[1]Includes Railroad Retirement benefits.
