TABLES.

UNITED STATES.

1. Distribution by age periods for the total population, by sex, for the United States: 1850–1920	154
2. Distribution by broad age groups for population classes, by sex, for the United States: 1920 and 1910	155
3. Distribution by age periods for population classes, by sex, for the United States: 1920	156
4. Per cent distribution by age periods for principal population classes, by sex, for the United States: 1920	157
5. Distribution by age periods for Indian, Chinese, Japanese, and "all other" population, by sex, for the United States: 1920	157
6. Distribution by age periods for population classes, by sex, for the United States: 1920, 1910, and 1900	158
7. Per cent distribution by age periods for principal population classes, by sex, for the United States: 1920, 1910, and 1900	160
8. Males to 100 females, by age periods, for population classes, for the United States: 1920 and 1910	161
9. Distribution by single years of age for population classes, by sex, for the United States: 1920	162
10. Distribution by single years of age for Indian, Chinese, Japanese, and "all other" population, by sex, for the United States: 1920	166
11. Per cent distribution by single years of age for principal population classes, by sex, for the United States: 1920	168

DIVISIONS AND STATES.

12. Per cent distribution by broad age groups for the total population, by divisions and states: 1920, 1910, and 1900	169
13. Distribution by age periods for the total population and by single years of age for persons under 25, for population classes, both sexes, 1920 and 1910, and each sex, 1920, by divisions and states	170
14. Distribution by age periods for Indian, Chinese, and Japanese population, by sex, for certain states: 1920	286

PRINCIPAL CITIES.

15. Distribution by age periods for the total population and by single years of age for persons under 25, for population classes, by sex, for cities having 500,000 inhabitants or more: 1920	288
16. Distribution by age periods for population classes, by sex, for cities having from 25,000 to 500,000 inhabitants: 1920	305
17. Distribution by broad age groups for the total population, for cities having 25,000 inhabitants or more: 1920	362

URBAN AND RURAL.

18. Distribution by broad age groups for principal population classes, by sex, in urban and rural communities, by divisions: 1920 and 1910	371

CHAPTER III.—AGE DISTRIBUTION.

INTRODUCTION.

At every census some attempt has been made to distribute the population by age, but at the early censuses the age grouping was not elaborate. In 1790 the only age distribution was that for white males, those 16 years of age and over being distinguished from those under 16. In 1800 and 1810 the white males and females were distributed into five age groups. In 1820 the white males were distributed into six age groups, the white females into five, and the slaves and free colored into four. In 1830 and 1840 the whites were distributed into age groups of 5 or 10 years, and the slaves and free colored into six broader age groups. In 1850 and 1860 the whites, slaves, and free colored were distributed according to sex into 5-year groups up to and including 19 years and into 10-year groups from 20 to 100 years, and those under 1 year of age were separately classified. In 1860 the Chinese and civilized Indians were distributed in the same way. In 1870 the native, foreign born, native white, colored, foreign-born white, Chinese, and civilized Indians were distributed by single years to and including 4 years of age, and thereafter by 5-year age periods; 18 and 19 (one period), 20, and 21–24 years were also classified separately. In 1880 and at each subsequent census the total population classified by nativity and color has been tabulated according to single years of age; and, beginning with 1890, the native whites classified according to parentage have been similarly tabulated by single years.

For various uses to which census material is put, statistics in regard to age are of great importance. Mortality rates attain their full value only when the population can be distributed according to sex and age. Satisfactory birth rates and marriage rates can be computed only when statistics with regard to sex, age, and marital condition are available. The voting strength depends upon the age distribution, and the military strength on the distribution according to sex and age. The differences in the age distribution of the native and foreign-born population are important in their bearing on the economic, social, and political effects of immigration. Statistics of school attendance and illiteracy would have much less value if age were not taken into account. In fact, there are very few questions in vital statistics or sociology which can be studied with intelligence until the age distribution of the population has been determined.

The statistics of age distribution for continental United States are here given in detail. Those for the outlying possessions enumerated at the Fourteenth Census are presented in the sections pertaining to those possessions in Volume III of the Fourteenth Census Reports.

UNITED STATES AS A WHOLE.

Distribution by single years of age.—If a country were entirely removed from communication with the rest of the world the age distribution of the population would be determined wholly by births and deaths, and, since death is continually depleting the population, the number of survivors at any given age would normally be less than the number at any younger age, although irregularities might result from any decided diminution in the number of births in any year or group of years or by an excessive rate of mortality among those born in some particular year or group of years. (See Table 9, p. 162, and diagram, p. 151.) Where a country is receiving or losing a large number of migrants every year, however, the age distribution undergoes a change. Since a large proportion of migrants are in the more active years of life, a country which had been losing considerable numbers by emigration would show abnormally small proportions in the adult ages, while a country, like the United States, which had been receiving large numbers of immigrants would show abnormally large proportions of adults. Migration, however, while affecting the age distribution in general, would not lead to any decided irregularities for single years, such as are shown by Table 9 and by the diagram on page 151.

Irregularities of this character are due in large part to errors in the census returns. These errors result from three causes: (1) Some persons do not know their exact age. (2) The enumerators are obliged in many cases to obtain information relating to the person enumerated from a third person, either some member of the family found at home or a person in charge of a hotel or boarding house, who can give the age only approximately. (3) In certain instances, apparently more frequent among women than among men, the age is intentionally misstated. Where the age is not accurately known there is a tendency to report it as a multiple of 2 or of 5, and especially, in the case of ages above 20, as a multiple of 10. There is also a tendency to concentrate on age 21 for men. In gen-

eral, the degree of inaccuracy is greater for adults than for children and youth, and is greatest for those classes of the population in which the proportion of illiterates is greatest. The returns also undoubtedly exaggerate the number of centenarians, particularly among the Negroes and Indians.

Distribution by 5-year periods and broad groups.—In order to neutralize the effect of concentration upon multiples of 2 and 5, the age statistics presented in most of the tables are given by 5-year periods or for broader age groups. Tables 9, 10, and 11, which relate to the United States as a whole, are the only ones in which the distribution by single years is given for all ages; but in Tables 13 and 15 the single-year distribution for persons under 25 is given for states and for cities of 500,000 or more, respectively. In general, the distribution by single years is unquestionably more nearly accurate for the younger than for the older ages; and it is only for the younger ages that variations from year to year are of great importance. In the older periods of life the changes that come with advancing years are more gradual, so that the differences between individual years are slight, and it is sufficient for most purposes if the figures can be presented with approximate accuracy by 5-year or broader age groups.

Effect of immigration on age distribution.—The abnormal constitution of the foreign-born white class affects materially the age distribution of the population as a whole. Were it not for immigration, the total population of the United States would show a somewhat smaller proportion of adults and a somewhat larger proportion of children and youth. (See Tables 3 and 4, pp. 156 and 157, and diagram, p. 151.)

Of the eight diagrams presented on pages 152 and 153, no two are identical in form, and the only one whose shape has not been perceptibly influenced by immigration, either directly or indirectly, is that representing the Negro population, although the diagram for the native whites of native parentage has not been greatly affected by this factor. The extraordinary character of the age distribution of the foreign-born whites, which is also brought out in the age-period tables, is clearly apparent in the diagram for that class.

Since the native white group includes the American-born children of foreign-born parents, the age distribution of this group is itself affected indirectly by immigration. The extent to which it has been so affected is not, however, easy to determine, depending largely upon variations in the volume of immigration. A great wave of immigration would normally be followed by a very material increase in the proportion of children in the native population; but if the immigration continued in undiminished volume the effect would become less marked as time went by. On the other hand, a sudden cessation or decline in immigration would be followed by an immediate falling off in the proportion of children in the native population, but here again the effect would tend to disappear with the passage of time if immigration were not resumed on its earlier scale.

The influence of immigration upon the age composition of the native population is, of course, most direct and obvious for those classes which are composed of persons one or both of whose parents were immigrants; that is, the native whites of foreign parentage and the native whites of mixed parentage. Even the age distribution of the native white population of native parentage is, however, indirectly affected by immigration, since the children of the native whites of foreign or mixed parentage are included in the class of native whites of native parentage. The Negroes, of course, are not affected by immigration to any appreciable extent.

A very considerable change has taken place since 1900 in the age distribution of the native whites of foreign or mixed parentage. Probably the chief cause of this change is to be found in the increase in the volume of immigration, which was much greater in proportion to the total population during the later than during the earlier half of the nineteenth century. It is but natural, therefore, that in 1900 there should be relatively few natives 50 years of age and over whose parents were born abroad, and that the proportion of such persons should increase from census to census. (See Table 7.)

Changes in the age distribution of the foreign-born whites from one census to another are materially affected both by the volume of immigration and by differences in the age distribution of the immigrants arriving at different periods.

Among the Chinese and Japanese the age distribution is abnormal to a still greater extent than among the foreign-born whites. The great bulk of both these races are immigrants, most of whom are unmarried men or men who have left their families in their native countries.

Age distribution of Negroes and Indians.—The age distribution of the Negroes and Indians, which is practically unaffected by immigration, is roughly similar to that of the native whites. Among the Negroes, however, the proportion of children under 5 is considerably smaller than in any of the native white classes, while the proportions in the age periods from 10 to 29 years are larger than the corresponding ones for either the native whites of native parentage or those of foreign parentage. The proportion of Negro children under 5 decreased to a marked extent between 1910 and 1920. (See Tables 4 and 7.)

Among the Indians the proportion of children is larger, and that of persons in the age groups from 15 to 44 is smaller, than in the case of either the native

whites or the Negroes. The chief, and perhaps the sole, explanation of this fact is to be found in the effect of intermixture of white and Indian blood. The children born of marriages between whites and Indians are all classified as Indians, while only one of the parents in each such marriage is thus classified. Since these intermarriages are becoming increasingly frequent, the number of persons of Indian-white mixed blood is increasing and is relatively greater among children than among older persons. The inclusion of these children with the Indian population, together with the exclusion of one parent in each case, increases the proportion of children and diminishes the proportion of adults in the Indian population. (See Table 5.)

Age distribution by sex.—Separate figures are given for each sex in most of the tables in this chapter. In addition, the age distribution for each sex in the total population and in each class of the population is shown by 5-year periods, in the diagrams on pages 152 and 153. In order to permit ready comparison of the proportions of males and females in each age period, the percentages shown for the sexes in connection with each diagram are based on the total population in the group or class to which the diagram relates, and not on the totals for the sexes separately. For example, the diagram relating to the native white population of native parentage shows that men in the age period 25–29 formed 4.1 per cent of the total native white population of native parentage, of both sexes, whereas Table 7 shows that men in this age period formed 8 per cent of the total native white males of native parentage.

Differences in age distribution as between males and females in the total population of the country are to be expected, by reason of the fact that the foreign born, whose age distribution is abnormal, include many more males than females. This condition explains in part the fact that in the total population a larger proportion of the males than the females are in the ages 30 to 69, inclusive, while the proportion under 30 years of age is greater among females than among males. (See Table 4.)

This difference in age distribution as between the sexes in the total population, however, is not wholly attributable to the presence of the foreign born, there being also considerable differences among the native classes. Starting with a moderate excess of males over females in the three age periods under 15 years, the returns for the native whites of native parentage show a practical equality of the sexes in the 15–19 period, an excess of females in the 20–29 periods, an excess of males in the 30–74 periods, and an excess of females in the periods above 74. Among the native whites of foreign parentage and of mixed parentage, however, the females outnumber the males in most of the age groups, especially in the foreign-parentage class. (See Table 8.)

The marked excess of females shown by the returns for the 20–24 age period in the class of native whites of native parentage is due in large part to understatement of ages. The native white women of native parentage enumerated as in this age period in 1920 (2,629,889) outnumbered the native white females of native parentage in the age period 10–14, as enumerated in 1910 (2,623,627). (See Table 6.) This is a manifest impossibility, since the 20–24 group in 1920, if correctly enumerated, would be made up solely of the survivors of the 10–14 group in 1910, assuming that group also to have been correctly enumerated. No similar inconsistency appears for native white males of native parentage, nor for either males or females in the class of native whites of foreign or mixed parentage. Moreover, in the age period 20–24 the women outnumbered the men in 1920, not only among the native whites of foreign or mixed parentage but even among the foreign-born whites, although in general the males predominate among the foreign born. Thus it can not be assumed that any considerable number of foreign-born white women or native white women of foreign or mixed parentage in the 20–24 age period were incorrectly returned as native white of native parentage. It is obvious, therefore, either that the number of native white females of native parentage enumerated in 1910 as in the age period 10–14 was too small, or that the native white women of native parentage enumerated in 1920 as in the 20–24 period included a considerable number who were actually 25 years of age or more. The latter supposition is by far the more probable. A similar inconsistency is disclosed by a comparison between the 1910 returns for native white women of native parentage in the 20–24 age period and the 1900 returns for the corresponding class of females in the 10–14 period.

It may be that in the age periods from 45 to 69, in which a pronounced excess of men over women is shown for the native white population of native parentage, this excess is exaggerated in some measure by the erroneous classification of foreign-born white men or native white men of foreign or mixed parentage as native white of native parentage. This seems probable, in view of the small excess of men or the excess of women in the corresponding age groups for the native whites of foreign parentage and of mixed parentage.

For the foreign-born whites the age distribution of the males is decidedly different from that of the females, the former being greatly in excess in the age periods from 25 to 69. (See Table 8.)

The age distribution of males and females among the Negroes, as reported, presents a peculiar condition. According to the returns there was in 1920 a slight

excess of females below the age of 15, a much larger excess in the age periods from 15 to 34, and a small excess in the 35–44 periods. From the ages of 45 to 69, however, there was a very great excess of men, followed by a moderate excess in the 70–79 periods and an excess of women in the ages above 79. The ratio of males to females for the Negroes in the 45–49 period (138.7 to 100) was higher than the foreign-born white ratio for any age period. The number of Negro men enumerated as in this age period in 1920 (320,506) was almost exactly the same as the number reported for the age period 35–39 in 1910 (320,450). This, of course, is an impossibility, for the reason that, disregarding the slight effect of immigration, the group of Negro men 45 to 49 years of age in 1920 would be made up solely of the survivors of those in the 35–39 age period in 1910. Inconsistencies of this character are due, wholly or in large part, to errors in estimating ages which can not be ascertained exactly by the enumerators. (See Tables 6 and 8.)

The age distribution by sex shown for the Negroes by the statistics for 1910 was somewhat similar to that indicated by the 1920 figures, but the excess of men from 45 to 69 years of age was less pronounced in the earlier than in the later year.

The remarkable excess of males over females shown in the 45–59 age periods for the Indians is doubtless due in considerable measure to inaccurate returns. (See Table 8.)

There is naturally an extraordinary difference between the two sexes in regard to age distribution in the case of the Chinese, Japanese, and "all other" population, due to the very great excess of males over females among the immigrants of these classes.

The probable errors in the statistics as to the age distribution of the two sexes are by no means confined to the census of 1920, prior censuses also having shown conspicuous inconsistencies in this respect, some of which at least can apparently be attributable only to erroneous returns.

Median age.—The median age is that age which divides the population into two equal groups, one-half being older and one-half younger than the median. The first tabular statement shows, for 1920, the median age for each important class of the population, disregarding persons of unknown ages.

The difference between the median ages of the two sexes for all classes combined is due in part to the fact that among the foreign born, whose median age is much higher than that of the natives, the males are considerably in excess of the females.

The comparatively low median ages of the native whites of foreign and of mixed parentage is due to the increase in the volume of immigration up to 1914. This resulted in a relatively rapid increase from year to year in the number of families in which one or both parents were foreign born, and therefore in the number of children born in such families. In consequence, the younger element of the native whites of foreign and of mixed parentage is disproportionately large and the older element disproportionately small.

	Total.	Male.	Female.
All classes	**25.2**	**25.8**	**24.7**
White	25.6	26.1	25.1
Native white	22.4	22.4	22.3
Native parentage	22.7	22.8	22.5
Foreign parentage	21.6	21.4	21.7
Mixed parentage	21.8	21.3	22.2
Foreign-born white	40.0	40.1	39.9
Negro	22.3	22.8	22.0
Indian	19.7	20.4	19.0
Chinese	40.2	42.7	19.4
Japanese	30.2	34.1	24.0

The median ages of the total population and of the white population show uninterrupted increases since 1820. These increases have been due to two causes: First, an increase in average length of life; second, a reduction in the birth rate, which has resulted in a decrease in the proportion of young persons in the total population.

The statement below shows, for all classes combined and for the white and colored population separately, disregarding persons of unknown ages, the median ages in 1920 and earlier census years.

CENSUS YEAR.[1]	ALL CLASSES.			WHITE.			COLORED (NEGRO, INDIAN, CHINESE, JAPANESE, AND "ALL OTHER").		
	Both sexes.	Male.	Female.	Both sexes.	Male.	Female.	Both sexes.	Male.	Female.
1920	25.2	25.8	24.7	25.6	26.1	25.1	22.5	23.0	21.9
1910	24.0	24.6	23.5	24.4	24.9	23.9	21.0	21.5	20.6
1900	22.9	23.3	22.4	23.4	23.8	22.9	19.7	20.0	19.5
1890	21.4	21.8	21.0	21.9	21.3	21.6	17.8	17.9	17.8
1880	20.9	21.1	20.6	21.3	21.6	21.0	18.0	18.0	18.0
1870	20.1	20.2	20.1	20.4	20.5	20.3	18.5	18.2	18.8
1860	19.4	19.7	19.0	19.7	20.1	19.3	17.7	17.8	17.5
1850	18.8	19.1	18.6	19.1	19.5	18.8	17.3	17.3	17.4
1840	17.8	17.8	17.7	17.9	17.9	17.8	17.3	17.0	17.5
1830	17.2	17.1	17.3	17.2	17.2	17.3	16.9	16.7	17.1
1820	16.7	16.6	16.7	16.5	16.5	16.6	17.2	16.9	17.4
1810	.....	.....	.....	16.0	15.9	16.1	.....	.....	.....
1800	.....	.....	.....	16.0	15.7	16.3	.....	.....	.....
1790	.....	.....	.....	.....	15.9	.....	.....	.....	.....

[1] Before 1880 ages were not tabulated by single years. In 1790 the ages of only the white males were ascertained, and in only two groups, under 16 and over 16. At successive censuses new details were added to the age classification, and since 1830 the ages of that part of the population in which the median age falls have been tabulated in 5-year groups. For the censuses before 1880 it has been assumed for the purpose of computing the median age that the proportions at the single years of age within the groups were the same as in 1900. For the colored population, which included only the Negroes at censuses prior to 1870, the age distribution of the Negroes in 1900 has been used as the standard.

DIVISIONS AND STATES.

Statistics for divisions and states are given in Tables 12 to 14. In Table 12 the states are shown by the geographic divisions adopted by the Census Bureau, but in Table 13, for convenience of reference, the order is alphabetical.

Very considerable differences exist among the nine geographic divisions of the country and among the individual states in regard to the age distribution of the total population and of specific classes of the population. The differences in regard to the total population are in part attributable to variations in the composition according to color or race, nativity, and parentage. Thus. a large proportion foreign born tends to produce a relatively large proportion of adults in the total population.

The differences among the divisions and states with regard to specific classes of the population are due to various factors. Interstate migration has a great influence upon age distribution. Adults, particularly the younger adults, are relatively much more numerous among migrants than in the total population, and therefore a division or state which has lost extensively through interstate migration is likely to have a smaller proportion of persons in the younger and middle ages of adult life in its native population than one which has gained by such migration. The distribution of ages in the urban population is usually decidedly different from that in the rural population, partly by reason of migration from country to city, and consequently the age constitution of the total population of a given class in a state or division is much affected by the proportions urban and rural. Again, the age composition of the several native classes is affected by differences in birth rates and in death rates and by differences in the extent to which changes have taken place in these rates from one time to another. Finally, the age distribution of the foreign born and of the natives of foreign or mixed parentage in any given state or section of the country depends in considerable measure upon the period of time during which immigration to that state or section was most rapid.

PRINCIPAL CITIES.

Statistics for individual cities are presented in Tables 15 to 17. Table 15, for cities having 500,000 inhabitants or more, corresponds to Table 13, for divisions and states, except for the omission of comparative figures for 1910; Table 16 shows quinquennial age periods and single years under 5 for cities having 100,000 inhabitants or more and gives a somewhat condensed age grouping for cities having from 25,000 to 100,000 inhabitants; and Table 17 presents a broad age grouping for all cities having 25,000 inhabitants or more.

URBAN AND RURAL COMMUNITIES.

Since marked differences exist between urban and rural communities in regard to the age distribution of their population, separate statistics are given for the two classes of communities in Table 18. In drawing the distinction between urban and rural population, all incorporated places (and all towns in Massachusetts, Rhode Island, and New Hampshire) having 2,500 inhabitants or more are treated as urban and the remainder of the country as rural.

In Massachusetts and Rhode Island it is not the practice, as in practically all the other states, to incorporate, as separate municipalities, the relatively densely populated portions of "towns" (which are the primary divisions of the counties), and no town as a whole is incorporated as a municipality until it attains a population greatly in excess of 2,500; and in New Hampshire a similar condition exists, although the state contains two incorporated villages, each of which has fewer than 2,500 inhabitants. For this reason those towns having 2,500 or more inhabitants in the three states named are treated as urban, although portions of their areas are rural in character. The urban areas in the three states in question, as classified by the census, thus contain relatively small numbers of inhabitants who in other sections of the country would be segregated as rural. Nevertheless, in most of the towns having 2,500 inhabitants or more in Massachusetts, Rhode Island, and New Hampshire by far the greater part of the population resides within the more densely settled areas, so that the proportion classed as urban, considering the New England division as a whole, is not greatly exaggerated by the practice adopted.

The pronounced differences between urban and rural communities in regard to the age distribution of their population are in part attributable to differences in the color or race, nativity, and parentage composition of their population, but there are also pronounced differences between them in regard to the age composition of individual population classes. The opportunities to be found in urban communities have attracted large numbers of persons in the more active ages, and, because of the effect of this cityward migration on age distribution, it is impossible to draw directly from the statistics any trustworthy conclusions as to the relative fecundity or the relative longevity of the native whites of native parentage in the two classes of communities.

The age distribution of the foreign-born whites and of the native whites of foreign or mixed parentage in urban and in rural areas, respectively, has been influenced to a very considerable extent by the period—whether recent or remote—during which immigration into these areas has been most rapid.

A large proportion of the earlier immigration went to the rural districts, but most of the recent immigration has gone to the cities.

The age distribution of the Negroes in urban and in rural areas is affected by the very considerable country-to-city migration of persons of this race in the active-age periods, and probably also by differences in birth and death rates between the two classes of communities.

The following statement brings out the marked differences between the urban and rural communities in regard to the sex distribution of the population in the age groups given in Table 18.

It will be seen that females, particularly in the adult ages, form a materially larger proportion of the population in urban than in rural communities, notwithstanding the fact that the foreign-born whites—a class in which males are greatly in the majority—are concentrated mainly in cities.

AGE GROUP.	MALES TO 100 FEMALES: 1920	
	Urban population.	Rural population.
All ages	**100.4**	**108.0**
Under 5 years	101.9	103.0
5 to 9 years	100.5	103.0
