COTTON PRODUCTION IN THE UNITED STATES

INTRODUCTION

The statistics given in this bulletin are published in order to make available final figures for cotton ginning and production for the crop of 1969. The statistics given in this publication are based upon reports collected from all cotton gins in the United States. These reports were collected during the cotton-ginning season and preliminary releases were issued within 8 days after the end of the reporting period for cotton ginned prior to August 1, August 16, September 1, September 16, October 1, October 18, November 1, November 14, December 1, December 13, January 16, and at the end of the season. The data for cotton ginned prior to August 1, September 1, October 1, November 1, December 1, January 16, and the total for the season are based upon reports obtained from all gins. The figures for cotton ginned prior to August 16, September 16, October 18, November 14, and December 13, represent estimates based upon reports received from 94.5 to 97.2 percent of the active gins. The percentages of the active gins for which estimates were made were as follows for each of the 5 reporting periods—August 16, 2.8 percent; September 16, 3.0 percent; October 18, 3.6 percent; November 14, 4.7 percent; and December 13, 5.5 percent.

Since 1939, each ginner has been required to keep a record of the county in which cotton ginned by him was grown. On the basis of the reports obtained from these records, data on cotton production have been obtained by allocating all cotton ginned to the county and State in which the cotton was grown. Therefore, the production of cotton in a county may differ from the ginnings because not all the cotton ginned in the county may have been grown in that county. Data are shown for most counties with a production of 100 or more bales, provided the cotton was ginned by at least three gins. Figures on cotton ginned are given when the ginning was performed by three or more gins. Where there were less than three gins active in a county, the figures for the county have been combined with all other counties in order to avoid disclosure of information for individual gins.

In order to measure accurately the size of the cotton crop, it is necessary to convert running bales, which vary in weight, into bales of uniform weight. For this purpose, data on bale weights have been collected from all gins. Generally, two reports on bale weights are collected during the season. The first report related to cotton ginned prior to November 1, and the second, to that ginned November 1 and later. The weight of bales was collected for a sample of the cotton ginned. For gins in counties in which usually less than 20,000 bales are ginned each season, the weight of every 10th bale was secured; for counties in which usually 20,000 to 40,000 bales are ginned, the weight was secured for every 20th bale; and for counties in which more than 40,000 bales are ginned, the weight of every 50th bale was obtained. On the basis of these reports, the weighted average gross weight of running bales and the number of equivalent 500-pound bales were computed for each county and State.

TABLE 1.—*Comparative summary—Cotton production; number of active cotton gins and average number of bales ginned per gin: Crops of 1899–1969*

Year of growth	Cotton (exclusive of linters)							Number of active gins	Average number of bales per gin
	Running bales, counting round as half bales	Equivalent 500-pound bales	Running bales						
			Total	Upland		American-Egyptian	Sea Island		
				Square	Round

*Revised.
[1] Included are 37,587 bales American-Egyptian grown in Arizona and California; 11,982 in New Mexico; and 27,269 in Texas.
[2] Based on equivalent 500-pound bales (gross weight).
[3] Tons of cottonseed included in Virginia.
[4] Bales ginned in Illinois included with Kentucky.
[5] Less than 0.05 percent.
[6] Bales ginned in Kentucky and Illinois included with Virginia.

TABLE 5.—*Cotton ginned prior to specified dates during the season, by States: 1966–69*
