Census of Population and Housing, 1980:
Summary Tape File 4, Puerto Rico

User Note No. 1

Subject: Information Pertaining to Using the Data from STF 4, Puerto Rico

Negative Numbers in Aggregate Income Fields. Negative numbers may appear in some of the aggregate income fields. They appear most frequently in the aggregate household nonfarm and farm self-employment income fields in tables PA147 and PA148, and in the aggregate household income fields in tables PB77 and PB80.

Negative Numbers in Table PB101. When a cell in this table contains a negative number, the minus sign is not located in the cell's left-most character. Rather, the minus sign is preceded by zero fill. For example, "-100" is presented as "00000-100."

Median Income. Median income figures were calculated exclusively by linear interpolation. In the corresponding reports, PC80-1-C, General Social and Economic Characteristics, and PHC80-2, census tracts, median income figures less than $30,000 were generally computed using linear interpolation; all other income amounts were derived through Pareto interpolation. For a detailed description of these interpolation procedures, see Appendix B to the Current Population Reports, Series P-60, No. 129.

Median Persons Per Unit in Table HA20. If a median fell in the lowest interval, it was set to "000000010" instead of "000000100." If a median fell in the highest interval, it was set to "000000066" instead of "000000551." The error is such that the two erroneous sets are still unique and one can still determine whether the median falls in the lower or higher range.

Not Computed Category in Table HB52. The "not computed" category for "Selected Monthly Owner Costs as Percentage of Household Income in 1979" incorrectly includes "not mortgaged units with no utility, fuel, tax, or insurance costs." Equivalent data in STF 3 are correct.

Place/Part Indicator. The place/part indicator field for summary level 27 on STF 4B for Puerto Rico is not applicable. Codes appearing in that field for summary level 27 are unreliable.

GEOGRAPHIC COVERAGE:

File A provides summaries for standard metropolitan statistical areas (SMSA's) and for the following SMSA components: municipios, places[1/] of 10,000 or more inhabitants, census tracts, and totals for census tracts split by places of 10,000 or more inhabitants. A summary is also provided for the tracted remainder (Aguadilla and Peñuelas) outside of SMSA's.

File B provides summaries for Puerto Rico, urban/rural, and standard metropolitan statistical area (SMSA) components; the standard consolidated statistical area (SCSA) and the urban, rural, and rural farm portions of the SCSA; SMSA's and the urban, rural, and rural farm portions of the SMSA; urbanized areas (UA's); municipios and the rural and rural farm portions of the municipio; minor civil divisions (MCD's)[2/]; ciudades and pueblos and places of 2,500 or more inhabitants.

TECHNICAL DESCRIPTION:

FILE SIZE:

STF 4A and STF 4B comprise one file each. Because of their large size, the files are divided into segments comprising 1,956 characters as follows: 3 segments in the population A record, 14 segments in the population B record, 18 segments in the housing A record, and 9 segments in the housing B record.

1/ Places in Puerto Rico are referred to as zonas urbanas and aldeas.
2/ Minor civil divisions (MCD's) in Puerto Rico are referred to as barrios and pueblos. The two ciudades in Ponce and San Juan also are regarded as MCD's but, since they are comprised entirely of barrios, data are tabulated only for the barrios in listings of MCD's.

A printout listing the number of logical records and the block size will accompany each file.

FILE SIZE SEQUENCE:

The file is sorted by level of geographic hierarchy.

A and B Records on STF 4

STF 4 data are presented in two types of records, A and B, each record type containing different tables. For each geographic area meeting suppression criteria, population record A is followed by population record B; housing record A is followed by housing record B. Both record A and record B summarize data for the total population.

To facilitate use of STF 4, tables that deal primarily with population data are prefixed with a "P," for example "PA12;" tables that deal primarily with housing data are prefixed with an "H," for example, "HB62." Some questions that were included on questionnaires used in the 50 States and the District of Columbia were not asked on the forms used in Puerto Rico. Tables referring to these items were omitted from the Puerto Rico summary tape files and the corresponding documentation. However, to retain comparability, the Puerto Rico documentation maintains the same table numbering scheme used in the documentation for the 50 States and the District of Columbia. The following tables were omitted from STF 4, Puerto Rico:

PA4-PA6	PA51-PA53	HA5	HA82-HA84	HB12
PA11-PA13	PA87	HA7-HA9	HA89	HB14
PA15	PA88	HA14	HA90	HB27
PA16	PA96	HA16	HA101	HB28
PA18	PA97	HA32	HA103-HA108	HB33
PA20	PA153-PA190	HA48	HA111-HA116	HB34
PA31	PB1-PB4	HA58		HB60
PA32	PB23	HA61		HB76
PA37	PB123	HA67		HB77
PA45	PB124	HA68		

File Segmentation

Because of its large census logical record size, STF 4 is divided into several record segments. Files A and B consist of 3 segments for the population A record, 14 segments for the population B record, 18 segments for the housing A record, and 9 segments for the housing B record. Each segment contains 1,956 characters with each cell occupying 9 characters except in the tables listed below. Fifteen characters were allocated for cells in the following tables:

PA142-PA152	PB80	HA25
PA191	PB84	HA65
PB14	PB87	HB7
PB42	PB90	HB19
PB61	PB91	HB22
PB63	PB95	HB41
PB73	PB98	HB44
PB75	PB100	HB55
PB77	PB102-PB105	HB80
PB79	PB118	HB82

Segment arrangement for each record is shown on the following two pages. If a table is divided between two segments, the final cell of the table in the first segment and the first cell of the table in the second segment are shown in parentheses.

The first segment in population record A and in housing record A begins with 252 characters of geographic information, suppression flags, and a record B indicator, while each subsequent segment begins with 102 characters of geographic information identical to the first 102 characters of the record.

The first segment in population record B and in housing record B begins with geographic information identical to the first 204 characters in each record A, followed by suppression indicators. Each subsequent segment begins with 102 characters of geographic information identical to the first 102 characters of the record.

Geographic Coverage

STF 4A

STF 4A provides data for census tracts within SMSA's in Puerto Rico, as well as the non-SMSA tracted remainder. The chart below shows the geographic hierarchy of the file.

Geographic Hierarchy of STF 4A

SMSA
- Municipio
  - Place of 10,000+[1/]
    - Census tract
  - Total for split census tracts

The standard metropolitan statistical area (SMSA) record (summary level 08) contains a summary for each SMSA within Puerto Rico in FIPS SMSA code sequence. A record for the tracted area outside of the SMSA's has a pseudo SMSA code of 9999.

The municipio record (summary level 17) contains a summary for each municipio within the SMSA. These summaries are in FIPS municipio code sequence. Municipios in the tracted area outside the SMSA have a pseudo SMSA code of 9999.

The place record (summary level 23) contains a summary for each place or portion of a place (if the place crosses municipio boundaries) within each component municipio. In this summary, places are defined as 1) central cities of SMSA's, 2) other places of 10,000 or more inhabitants, and/or 3) remainder of municipio. The places are in census place code sequence. The "remainder of municipio" record has a pseudo place code of 9999.

The census tract record (summary level 24) contains a summary for each tract or portion of a tract within a place of 10,000 or more inhabitants, place segment, and/or remainder of the tracted municipio. These summaries are in census tract number sequence. For the portion of an SMSA that is not tracted, the summary has a pseudo tract number of 999999.

The split census tract total record (summary level 32) contains a summary for each tract that is split by one or more places of 10,000 or more inhabitants.

STF 4B

STF 4B presents data for Puerto Rico as well as smaller geographic levels. The following chart shows geographic summary levels on this file.

1/ Places in Puerto Rico are referred to as zonas urbanas and aldeas.

Geographic Hierarchy of STF 4B

The State equivalent record (summary level 04) contains a summary for Puerto Rico. It is followed by a summary for each of the component parts listed below. If there are no data for a specific component, the summary contains zeroes in the data cells. These components are further identified by the urban/rural code (positions 12-13) or the SMSA component code (positions 14-15).

      - Central cities
      - Not in central cities
    - Rural
  - Outside SMSA's
    - Urban
    - Rural

1/ MCD's in Puerto Rico are referred to as pueblos and barrios; ciudades also are regarded as MCD's, but since they are comprised entirely of barrios, data are tabulated for the barrios in listings of MCD's.

2/ Places in Puerto Rico are referred to as zonas urbanas and aldeas.

The standard consolidated statistical area (SCSA) record (summary level 06) contains a summary for the SCSA in Puerto Rico. Following this summary is a summary for the urban part of the SCSA, followed by a summary for the rural part of the SCSA, followed by a summary for the rural farm part of the SCSA.

The standard metropolitan statistical area (SMSA) record (summary level 08) contains a summary for each SMSA in Puerto Rico. These records are in FIPS SMSA code sequence. When this summary is present, there also is a summary for the urban part of the SMSA, followed by a summary for the rural part of the SMSA, followed by a summary for the rural farm part of the SMSA.

The urbanized area (UA) record (summary level 10) contains a summary for each UA in Puerto Rico. These records are in census UA code sequence.

The municipio record (summary level 11) contains a summary for each municipio in FIPS municipio code sequence. Each summary is followed, if applicable, by a summary for the rural portion of the municipio and, if applicable, by a summary for the rural farm portion of the municipio.

The MCD record (summary level 12) contains a summary for each MCD within the municipio in census MCD code sequence.

SUPPRESSION

To maintain the confidentiality promised respondents and required by law, the Census Bureau takes precautions to make sure that its public data, in print or on tape, do not disclose information about particular individuals or housing units; therefore, the Bureau suppresses tabulations of characteristics for very small groups of people or housing units. On summary tape files, zeroes are entered in suppressed cells. However, a zero in a cell does not automatically mean suppression. Only by checking the suppression flag field can it be determined if the zero in a specific table is suppressed data or an actual count.

The following discussion outlines the rules for suppression in STF 4, Puerto Rico.

No Suppression

The following counts will never be suppressed:

Total population
Total housing units
Seasonal housing units
Year-round housing units
Occupied housing units
Vacant year-round housing units

Primary Suppression

Suppression of Population Characteristics. Characteristics of persons are shown only if there are 30 or more persons in the geographic area. For example, on a record for a census tract with a population of 1 to 29 persons, population characteristics such as age and relationship are suppressed.

Suppression of Year-round Housing Characteristics. Characteristics of year-round housing units which are not classified by occupancy status (e.g., number of rooms, plumbing facilities, etc.) are shown when there are 10 or more year-round housing units in the geographic area being tabulated regardless of the number of occupied housing units or the number of persons.

Suppression of Family, Household, or Occupied Housing Characteristics. Characteristics of families, households, or occupied housing units are shown if there are ten or more occupied housing units within the geographic area tabulated.

Suppression of Owner or Renter Characteristics. Distributions of data for owners or renters are shown only when the number of owners is ten or more and the number of renters is also ten or more.

Complementary Suppression

In some cases, complementary suppression is applied to prevent the derivation of suppressed data by substraction. For instance, when a table shows the number of persons in unit for all households and also for renters, there must be 10 or more owners and 10 or more renters for the renter data to be shown; otherwise, the characteristics of the owners could be derived by substracting renter data from data for all households.

Programming with Suppression

Suppressed data cells contain zeroes. To distinguish between zeroes as suppression and zeroes as valid data, occurrences of suppression are identified by a series of flag fields in the geographic identification portion of each logical record. Programmers developing software should include procedures to check these fields for the presence of suppression and, if necessary, to flag the output of any cumulation which includes one or more suppressed fields.

In reviewing the data dictionary, the programmer can determine which suppression flags indicate suppression for particular tables by checking either the table description or the flag description.

Evaluating the Effect of Suppression

In most cases, suppressed data values are small (fewer than 10 or 30) except where a large population is affected by complementary suppression. Therefore, in certain noncritical applications, users may simplify programming operations by ignoring suppression and treating suppressed cells as zero cells. However, when geographic entities are being summed to higher levels or new geographic areas are being created, suppression will usually result in a downward bias in the totals.

STF 4, PUERTO RICO
TECHNICAL INFORMATION

Introduction

The data available on STF 4, Puerto Rico are based on the 1980 census sample. The data are estimates of the actual figures that would have resulted from a complete count. Estimates can be expected to vary from the complete count result, because they are subject to two basic types of error---sampling and nonsampling. The sampling error in the data arises from the selection of persons and housing units to be included in the sample. The nonsampling error, which affects both sample and complete count data, is the result of all other errors that may occur during the collection and processing phases of the census. A more detailed discussion of both sampling and nonsampling error and a description of the estimation procedure are provided below.

Sample Design

While every person and housing unit in Puerto Rico was enumerated on a questionnaire that requested certain basic demographic information (e.g., age, marital status, relationship), a sample of persons and housing units was enumerated on a questionnaire that requested additional information. The basic sampling unit for the 1980 census was the housing unit, including all occupants. For persons living in group quarters, the sampling unit was the person. One-sixth of the housing units or persons in group quarters were sampled.

The census of Puerto Rico was conducted through a combination of self-enumeration and personal interview. In areas with postal delivery service, an advance census questionnaire, which contained explanatory information and the same questions as the short-form questionnaire, was delivered to every housing unit by postal carrier on his or her route several days before Census Day. In areas without carrier delivery service, questionnaires were available where people picked up their mail. A blank listing book with designated sample lines (every sixth line) was prepared for the enumerator. The enumerator systematically canvassed the area and listed in the listing book all housing units in the order they were encountered. Beginning on Census Day, questionnaires, including sample information for any housing unit listed on a designated sample line, were completed and collected.

An enumerator was responsible for a small geographic area known as an enumeration district, or ED. An ED usually represented the average workload area for one enumerator.

Errors in the Data

Since the data in this file are based on a sample, they may differ somewhat from complete-count figures that would have been obtained if all housing units, persons within those housing units, and persons living in group quarters had been enumerated using the same questionnaires, instructions, enumerators, etc. The deviation of a sample estimate from the average of all possible samples is called the sampling error. The standard error of a survey estimate is a measure of the variation among the estimates from the possible samples and thus is a measure of the precision with which an estimate from a particular sample approximates the average result of all possible samples. The sample estimate

and its estimated standard error permit the construction of interval estimates with prescribed confidence that the interval includes the average result of all possible samples. The method of calculating standard errors and confidence intervals for the data on STF 4 Puerto Rico is given below. In addition to the variability which arises from the sampling procedures, both sample data and complete-count data are subject to nonsampling error. Nonsampling error may be introduced during each of the many extensive and complex operations used to collect and process census data. For example, operations such as editing, reviewing, or handling questionnaires may introduce error into the data. A more detailed discussion of the sources of nonsampling error is given in the section on "Control of Nonsampling Errors."

Nonsampling error may affect the data in two ways. Errors that are introduced randomly will increase the variability of the data, and should therefore be reflected in the standard error. Errors that tend to be consistent in one direction will make both sample and complete-count data biased in that direction. For example, if respondents consistently tend to underreport their income, then the resulting counts of households or families by income category will be skewed toward the lower income categories. Such biases are not reflected in the standard error.

Calculation of Standard Errors

1. Totals and Percentages. Tables A through C contain the information necessary to calculate the standard errors of sample estimates in this file. In order to perform this calculation, it is necessary to know the unadjusted standard error for the characteristic, given in table A or B, that would result under a simple random sample design (of persons, families, or housing units) and estimation technique; and the adjustment factor for the particular characteristic estimated shown in table C. The adjustment factors reflect the effects of the actual sample design and complex ratio estimation procedure used for the 1980 census.

   To calculate the approximate standard error of an estimate, follow the steps given below.

   a. Obtain the unadjusted standard error from table A or B (or from the formula given below the table) for the estimated total or percentage, respectively;

   b. Use table C to obtain the factor for the characteristic (e.g. occupation, years of school completed, age). Multiply the unadjusted standard error by this factor. If the estimate is a crosstabulation of more than one characteristic, use the largest factor.

   As is evident from the formulas below tables A and B, the unadjusted standard errors of zero estimates or of very small estimated totals or percentages approach zero. This is also the case for very large percentages or estimated totals that are close to the size of the tabulation areas to which they correspond. These estimated totals and percentages are, nevertheless, still subject to sampling and nonsampling variability, and an estimated standard error of zero (or a very small standard error) is not appropriate.

For estimated percentages that are less than 2 or greater than 98, use the unadjusted standard errors in table B that appear in the 2 or 98 row. For an estimated total that is less than 50 or within 50 of the total size of the tabulation area, use an unadjusted standard error of 16.

An illustration using the tables to compute standard errors begins on page 23.

Differences. The standard errors estimated from these tables are not directly applicable to differences between two sample estimates. In order to estimate the standard error of a difference, the tables are to be used somewhat differently in the following three situations.

a. For the difference between a sample estimate and a complete-count value, use the standard error of the sample estimate.

b. For the difference between (or sum of) two sample estimates, the appropriate standard error is approximately the square root of the sum of the two individual standard errors squared; that is, for standard errors Se_x and Se_y of estimates x and y:

$$Se_{(x+y)} \doteq Se_{(x-y)} = \sqrt{(Se_x)^2 + (Se_y)^2}$$

This method, however, will underestimate (overestimate) the standard error if the two items in a sum are highly positively (negatively) correlated or if the two items in a difference are highly negatively (positively) correlated. This method may also be used for the difference between (or sum of) sample estimates from two censuses or between a census sample and another survey.

c. For the difference between two estimates, one of which is a subclass of the other, use the tables directly where the calculated difference is the estimate of interest.

3. Means. The standard error of a mean depends upon the variability of the distribution on which the mean is based, the size of the sample, the sample design (for example, the use of households as a sampling unit), and the estimation procedure used.

An approximation to the standard error of the mean may be obtained as follows: compute the variance of the distribution on which the mean is based; multiply this value by five and divide the product by the total count of units in the distribution; obtain the square root of this quotient and multiply the result by the adjustment factor from table C that is appropriate for the characteristic on which the mean is based.

4. Medians. For the standard error of a median of a characteristic, it is necessary to examine the distribution from which the median is derived, as the size of the base and the distribution itself affect the standard error. An approximate method is given here. As the first step, compute one-half of the number on which the median is based (refer to this result as N/2). Treat N/2 based (refer to this result as N/2). Treat N/2 as if it were an ordinary estimate and obtain its standard error as instructed above using

tables A, B, and C. Compute the desired confidence interval about N/2. Starting with the lowest value of the characteristic, cumulate the frequencies in each category of the characteristic until the sum equals or first exceeds the lower limit of the confidence interval about N/2. By linear interpolation, obtain a value of the characteristic corresponding to this sum. This is the lower limit of the confidence interval of the median. In a similar manner, cumulate frequencies starting from the highest value of the characteristic until the sum equals or exceeds the count in excess of the upper limit of the interval about N/2. Interpolate as before to obtain the upper limit of the confidence interval for the estimated median.

Confidence Intervals

A sample estimate and its estimated standard error may be used to construct confidence intervals about the estimate. These intervals are ranges that will contain the average value of the estimated characteristic that results over all possible samples, with a known probability. For example, if all possible samples that could result under the 1980 census sample design were independently selected and surveyed under the same conditions, and if the estimate and its estimated standard error were calculated for each of these samples, then:

(1) Approximately 68 percent of the intervals from one estimated standard error below the estimate to one estimated standard error above the estimate would contain the average result from all possible samples; and

(2) Approximately 95 percent of the intervals from two estimated standard errors below the estimate to two estimated standard errors above the estimate would contain the average result from all possible samples.

The intervals are referred to as 68 percent and 95 percent confidence intervals, respectively.

The average value of the estimated characteristic that could be derived from all possible samples is or is not contained in any particular computed interval. Thus, we cannot make the statement that the average value has a certain probability of falling between the limits of the calculated confidence interval. Rather, one can say with a specified probability or confidence that the calculated confidence interval includes the average estimate from all possible samples (approximately the complete-count value).

Confidence intervals may also be constructed for the difference between two sample figures. This is done by computing the difference between these figures, obtaining the standard error of the difference (using the formula given earlier) and then forming a confidence interval for this estimated difference as above. One can then say with specified confidence that this interval includes the difference that would have been obtained by averaging the results from all possible samples.

The estimated standard errors given on STF 4 Puerto Rico do not include all portions of the variability due to nonsampling error that may be present in the data. The standard errors reflect the effect of simple response variance, but not the effect of correlated errors introduced by enumerators, coders, or other field or processing personnel. Thus, the standard errors calculated represent a lower bound of the total error. As a result, confidence intervals formed using

these estimated standard errors may not meet the stated levels of confidence (i.e., 68 or 95 percent). Thus, some care must be exercised in the interpretation of the data on STF 4 Puerto Rico based on the estimated standard errors.

For more information on confidence intervals and nonsampling error, see any standard sampling theory text.

Use of Tables to Compute Standard Errors

1. A table shows that for [zona urbana A] out of all [55,672] persons 18 years of age and over, [8,536] have completed 1 to 3 years of college. The procedure for obtaining the standard error of [8,536] will be demonstrated.

   The unadjusted standard error for the estimated total is obtained from table A or from the formula below table A. In order to avoid interpolation, the use of the formula will be demonstrated here. By the formula, the unadjusted standard error, Se, is given by

$$Se = \left[\sqrt{5\ (8{,}536)\ \left(1 - \frac{8{,}536}{82{,}968}\right)}\right] = 196 \text{ persons.}$$

Note: The total count of persons for [zona urbana A] is [82,968].

   The standard error of the estimated [8,536] persons who are 18 years of age and over who have completed 1 to 3 years of college is found by multiplying the unadjusted standard error, [196], by the appropriate adjustment factor. Table C lists the adjustment factor for the characteristic "Years of school completed" as [1.2]. The estimated standard error is [196] x [1.2] or [235].

   The estimated percent of persons 18 years of age and over who have completed 1 to 3 years of college is [15.3]. From table B, the unadjusted standard error is found to be [0.4]. Thus, the standard error for the estimated percent of persons 18 years of age and over who have completed 1 to 3 years of college is seen to be [1.2] x [0.4] = [0.48].

   A note of caution concerning numerical values is necessary. Standard errors of percentages derived in this manner are approximate. Calculations can be expressed to several decimal places, but to do so would indicate more precision in the data than is justifiable. Final results should contain no more than one decimal place when the estimated standard error is one percentage point (i.e., 1.0) or more.

2. In the previous example, the standard error of the [8,536] persons 18 years of age and over who have completed 1 to 3 years of college in [zona urbana A] is found to be [235]. Thus, a 95-percent confidence interval for this estimated total is

   [8,536] - 2 ([235]) to [8,536] + 2 ([235])

   or

One can say with about 95-percent confidence that this interval includes the value that would have been obtained by averaging the results from all possible samples.

3. The calculation of standard errors and confidence intervals will be illustrated when a difference of two sample estimates is obtained. For example, suppose the number of persons in [another zona urbana] 18 years of age and over who have completed 1 to 3 years of college is [48,922] and the total number of persons 18 years of age and over is [294,443]. Thus, the percentage of persons 18 year of age and over who have completed 1 to 3 years of college is [16.6] percent. The unadjusted standard error from table B is [0.2] percent. From table C, the adjustment factor for "Years of school completed" is [1.2]. The approximate standard error of the percentage (16.6 percent) is [0.2] x [1.2] = [0.24].

   Suppose that one wishes to obtain the standard error of the difference between the two zonas urbanas for the percentages of persons 18 years of age and over who have completed 1 to 3 years of college.

   The difference in the percentages of interest for the two zonas urbanas is

$$[16.6] - [15.3] = [1.3] \text{ percent}$$

   Using the results of the previous example

$$\begin{aligned} Se([1.3] &= \sqrt{(Se[16.6])^2 + (Se[15.3])^2} \\ &= \sqrt{([0.24])^2 + ([0.48])^2} \\ &= [0.54] \text{ percent} \end{aligned}$$

   The 95-percent confidence interval for the difference is formed as before:

$$[1.3] - 2\,[0.54] \quad \text{to} \quad [1.3] + 2\,[0.54]$$

or

$$[0.2] \text{ to } [2.4]$$

   One can say with 95-percent confidence that the interval includes the difference that would have been obtained by averaging the results from all possible samples.

Estimation Procedure

The estimates which appear on STF 4 Puerto Rico were obtained from an iterative ratio estimation procedure which resulted in the assignment of a weight to each sample person or housing unit record. For any given tabulation area, a characteristic total was estimated by summing the weights assigned to the persons or housing units in the tabulation area which possessed the characteristic. Estimates of family characteristics were based on the weights assigned to the family members designated as householders. Each sample person or housing unit record was assigned exactly one weight to be used to produce estimates of all characteristics. For example, if the weight given to a sample person or housing unit had the value five, all characteristics of that person or housing unit would be tabulated with a weight of five. The estimation procedure, however, did assign weights which vary from person to person or housing unit to housing unit.

The estimation procedure used to assign the weights was performed in geographically defined "weighting areas." Weighting areas were generally formed of adjoining portions of geography, which closely agreed with census tabulation areas within municipios. Weighting areas were required to have a minimum sample of 400 persons. Weighting areas were never allowed to cross municipio boundaries. In small municipios with a sample count of less than 400 persons, the minimum required sample condition was relaxed to permit the entire municipio to become a weighting area.

Within a weighting area, the ratio estimation procedure for persons was performed in three stages. For persons, the first stage employed seventeen household-type groups.

The second stage used two groups: householders and non-householders. The third stage could potentially use 16 age-sex groups. The stages were as follows:

Persons

Stage I - Type of Household

Group	
	Persons in Housing Units With a Family With Own Children Under 18.
1	2 persons in housing unit
	3 persons in housing unit
3	4 persons in housing unit
4	5 to 7 persons in housing unit
5	8-or-more persons in housing unit
	Persons in Housing Units With a Family Without Own Children Under 18.
6-10	2 persons in housing unit through 8-or-more persons in housing unit
	Persons in All Other Housing Units
11	1 person in housing unit
12-16	2 persons in housing unit through 8-or-more persons in housing unit
17	Persons in group quarters

Stage II - Householder/Non-householder

Group	
1	Householder
2	Non-householder (including persons in group quarters)

Stage III - Age/Sex

Group	
	Male
1	0 to 4 years of age
3	5 to 14 years of age
3	15 to 19 years of age
4	20 to 24 years of age
5	25 to 34 years of age
6	35 to 44 years of age
7	45 to 64 years of age
8	65 years of age or older
	Female
9-16	Same age categories as groups 1 to 8

Within a weighting area, the first step in the estimation procedure was to assign each sample person record an initial weight. This weight was approximately equal to the inverse of the probability of selecting a person for the census sample.

The next step in the estimation procedure was to combine, if necessary, the groups in each of the three stages prior to the repeated ratio estimation in order to increase the reliability of the ratio estimation procedure. For each stage, any group that did not meet certain criteria concerning the unweighted sample count or the ratio of the complete count to the initially weighted sample count, was combined, or collapsed, with another group in the same stage according to a specified collapsing pattern.

As the final step, the initial weights underwent three stages of ratio adjustment which used the groups listed above. At the first stage, the ratio of the complete census count to the sum of the initial weights for each sample person was computed for each stage I group. The initial weight assigned to each person in a group was then multiplied by the stage I group ratio to produce an adjusted weight. In stage II, the stage I adjusted weights were again adjusted by the ratio of the complete census count to the sum of the stage I weights for sample persons in each stage II group. Finally, the stage II weights were adjusted at stage III by the ratio of the complete census count to the sum of the stage II weights for sample persons in each stage III group. The three stages of adjustment were performed twice (two iterations) in the order given above. The weights obtained from the second iteration for stage III were assigned to the sample person records. However, to avoid complications in rounding for tabulated data, only whole number weights were assigned. For example, if the final weight for the persons in a particular group was 7.2, then one-fifth of the sample persons in this group were randomly assigned a weight of 8 and the remaining four-fifths received a weight of 7.

Separate weights were derived for tabulating the place of work and migration data items. The weights were obtained by adjusting the weight derived above for persons on questionnaires selected for coding by the reciprocal of the ED coding rate and a ratio adjustment to ensure that the sum of the weights and the complete count total population figure would agree.

The ratio estimation procedure for housing units was essentially the same as that for persons. The major difference was that the occupied housing unit ratio estimation procedure was done in two stages and the vacant housing unit ratio estimation procedure was done in one stage. The first stage for occupied housing units employed sixteen household type categories and the second stage could potentially use 19 tenure-value/rent groups. For vacant housing units three groups were utilized. The stages for the ratio estimation for housing units were as follows:

Occupied Housing Units

Stage I - Type of Household

Group	
	Housing Units With A Family With Own Children Under 18
1	2 persons in housing unit

The estimates produced by this procedure realize some of the gains in sampling efficiency that would have resulted if the population had been stratified into the ratio estimation groups before sampling, and the sampling rate had been applied independently to each group. The net effect is a reduction in both the standard error and the possible bias of most estimated characteristics to levels below what would have resulted from simply using the initial (unadjusted) weight. A by-product of this estimation procedure is that the estimates from the sample will, for the most part, be consistent with the complete count figures for the population and housing unit groups used in the estimation procedure.

Control of Nonsampling Error

As mentioned above, nonsampling error is present in both sample and complete count data. If left unchecked, this error could introduce serious bias into the data, the variability of which could increase dramatically over that which would

result purely from sampling. While it is impossible to completely eliminate nonsampling error from an operation as large and complex as the 1980 census, the Bureau of the Census attempted to control the sources of such error during the collection and processing operations. The primary sources of nonsampling error and the programs instituted for control of this error are described below. The success of these programs, however, was contingent upon how well the instructions were actually carried out during the census. To the extent possible, both the effects of these programs and the amount of error remaining after their application will be evaluated.

Undercoverage. It is possible for some housing units or persons to be entirely missed by the census. This undercoverage of persons and housing units can introduce biases into the data. Two extensive programs that were developed to focus on this important problem are explained below:

- Enumerators filled an address card for each housing unit they listed. The cards were delivered to the post offices where carriers reviewed the cards and noted instances where there were addresses to which mail was delivered but for which there was no card. Missing addresses were added to the census list of housing units and were later enumerated.

- A recheck of housing units initially classified as vacant or nonexistent was utilized to further reduce the undercoverage of persons.

More extensive discussions of programs developed to reduce undercoverage will be published as the analyses of those programs are completed.

Respondent and Enumerator Error. The person answering the questionnaire or responding to the questions posed by an enumerator could serve as a source of error by offering incorrect or incomplete information. To reduce this source of error, questions were phrased as clearly as possible based on precensus tests and detailed instructions for completing the questionnaire were provided to each household. In addition, respondents' answers were edited for completeness and consistency and followed up as necessary. For example, if labor force items were incomplete for a person 15 years or older, long form field edit procedures would recognize the situation and a followup attempt to obtain the information would be made.

The enumerator may misinterpret or otherwise incorrectly record information given by a respondent; may fail to collect some of the information for a person or housing unit; or may collect data for housing units that were not designated as part of the sample. To control these problems, the work of enumerators was carefully monitored. Field staff were prepared for their tasks by using standardized training packages which included experience in using census materials. Also, the estimation procedure was designed to control for biases that would result from the collection of data from housing units not designated for the sample.

Processing Error. The many phases involved in processing the census data represent potential sources for the introduction of nonsampling error. The processing of the census questionnaires includes the field editing, followup, and transmittal of completed questionnaires; the manual coding of write-in responses; and the electronic data processing. The various field, coding and computer operations undergo a number of quality control checks to ensure their accurate application.

Nonresponse. Nonresponse to particular questions on the census questionnaire allows for the introduction of bias into the data, since the characteristics of the nonrespondents have not been observed and may differ from those reported by respondents. As a result, any allocation procedure using respondent data may not reflect this difference completely, either at the element level (individual person or housing unit) or on the average. Some protection against the introduction of large biases is afforded by minimizing nonresponse. In the census, nonresponse was substantially reduced during the field operations by the various edit and followup operations aimed at obtaining a response for every question. Characteristics for the nonresponses remaining after this operation were allocated by the computer using reported data for a person or housing unit with similar characteristics.

Editing of Unacceptable Data

The objective of the processing operation is to produce a set of statistics that describes the housing unit inventory and population as accurately and clearly as possible. To meet this objective, certain unacceptable entries were edited.

In the field, questionnaires were reviewed for omissions and certain inconsistencies by a census clerk or an enumerator and, if necessary, a followup was made to obtain missing information. In addition, a similar review of questionnaires was done in the central processing office. As a rule, however, editing was performed by hand, but only when it could not be done effectively by machine.

As one of the first steps in editing, the configuration of marks on the questionnaire column was scanned electronically to determine whether it contained information for a person or a housing unit or merely spurious marks.

If the column contained entries for at least two of the basic characteristics (relationship, sex, age, marital status), the inference was made that the marks represented a person. In cases in which two or more basic characteristics were available for only a portion of the people in the unit, other information on the questionnaire provided by an enumerator was used to determine the total number of persons. Names were not used as a criterion of the presence of a person because the electronic scanning did not distinguish any entry in the name space.

If any characteristic for a person or a housing unit was still missing when the questionnaire reached a central processing office, it was supplied by allocation. Allocations, or assignments of acceptable codes in place of unacceptable entries, were needed most often when an entry for a given item was lacking or when the information reported for a person or a housing unit on that item was inconsistent with other information for the person or unit. As in previous censuses, the general procedure for changing unacceptable entries was to assign an entry for a person or housing unit that was consistent with entries for other persons or units with similar characteristics. Thus, a person who was reported as a 20-year-old son of the householder, but for whom marital status was not reported, was assigned the same marital status as that of the last son processed in the same age group. The assignment of acceptable codes in place of blanks or unacceptable entries, it is believed, enhances the usefulness of the data.

The editing process also includes another type of correction; namely, the assignment of a full set of characteristics for a person or a housing unit. When there was an indication that a housing unit was occupied but the questionnaire contained no information for all or most of the people (although persons were known to be present) or when there was no information on the housing unit, a previously processed household was selected as a substitute and the full set of characteristics for each substitute person or unit was duplicated. These duplications fall into two classes: (1) "substitution for mechanical failure," e.g., when the questionnaire page was not properly microfilmed, and (2) "substitution for noninterview," e.g., when a housing unit was indicated as occupied but the occupants or housing unit characteristics were not listed on the questionnaire.

Specific tolerances were established for the number of computer allocations and substitutions that would be permitted. If the number of corrections was beyond tolerance, the questionnaires in which the errors occurred were clerically reviewed. If it was found that the errors resulted from damaged questionnaires, from improper microfilming, from faulty reading by FOSDIC of undamaged questionnaires, or from other types of machine failure, the questionnaires were reprocessed.

HOW TO USE THE DATA DICTIONARY

The data dictionary contains complete information regarding geographic codes, table information, and a detailed table layout. Information provided in both the geographic and table identification portions of the file is discussed below.

Geographic Identification

The first line of each geographic identification variable gives the name, size/scale, begin position, relative begin position, and the variable label. Following those items, on subsequent lines, are any applicable notes and value codes. Each of these items is defined below.

1. Name. This is an arbitrarily assigned 8-character identifier. It may be a mnemonic such as "STATE" or "EDNUMBER", or a sequential identifier such as "TAB1", "TAB2", etc.

2. Size/Scale. The size of a data item is given in characters.

3. Begin. This is the location in the data record of the first character of the data item.

4. Relative Begin. This value indicates the beginning location of a data item within a specified segment of files with segmented records.

5. Data Type. The data type (A) indicates that the data item is represented by an alphabetic or numeric code.

6. Description. Following the Data Type is a description of the data item. This heading is not labeled on the data dictionary. This section also provides any relevant notes or footnote references. In addition, any value codes necessary for the data item are listed and labeled here.

Table Identification

The documentation of tables begins with the name, size/scale, begin position, relative begin position, data type, and the number of cells. This information is followed by the table title, applicable suppression flags, universe definition, applicable footnotes, stratifier identification, and a listing of the cells. These items are defined on the following page.

The size/scale information is the same as defined above for geographic identification. Any scale value identified here applies to all cells of the table.

This item identifies the location of each cell in the table.

The symbol "N" denotes that an actual figure is provided. Data can be summarized or aggregated.

NAME	SIZE/ SCALE	BEGIN	RELATIVE BEGIN	DATA TYPE	NUMBER OF CELLS
TABLE HA4 (TABHA4)	9	280	280	N	28

This is an 8-character identifier of the table number. The convention used here, shown in parentheses, is to follow "TAB" with the table number, which identifies the data item as a table for CENSPAC. The "TABLE HA4" is generated by the CENSPAC Documentor program.

This item identifies the location of the first cell in the table relative to the beginning of the current segment.

This item gives the total number of data items, or cells, in the table. The number of cells is the product of the number of categories in each stratifier in the table.

Table Title. The title of the table identifies the stratifiers used in the table, and the number of categories in each stratifier. For example, this title indicates that there are four categories of tenure and vacancy status and seven categories of year structure built identified in the table.

TABHA4
TENURE AND VACANCY STATUS (4)
BY YEAR STRUCTURE BUILT (7)

Suppression Flags. This section of the documentation identifies applicable suppression flags and the cells to which they apply.

SUPFHA02 APPLIES TO CELLS 1-7
SUPFHA04 APPLIES TO CELLS 8-14
SUPFHA03 APPLIES TO CELLS 15-28

Universe. The universe identifies the unit of observation for the table. For example, the unit of observation in this table is condominium housing units.

UNIVERSE: CONDOMINIUM HOUSING UNITS

Footnotes. This section refers to footnotes listed at the end of the data dictionary which apply to the table.

SEE FOOTNOTE 40 43

Stratifiers. This section lists the stratifiers used in the table, in the order in which they appear on the data tape. For example, this table begins with the first category of tenure and vacancy status cross-classified by the seven categories of year structure built. This is followed by the three remaining categories of tenure and vacancy status, each of which is cross classified by the seven categories of year structure built. Headers representing stratifiers are followed by a colon and are not counted as cells.

OTHER THAN ONE OF THOSE INCLUDED IN ITEMS 1 THROUGH 20. ITEM 22, "PLACE OF WORK NOT REPORTED," IS A TALLY OF WORKERS CODED TO "PUERTO RICO, MUNICIPIO NOT REPORTED," OR "NOT REPORTED."

DATA ITEMS 1 THROUGH 21 ARE DEFINED CONSISTENTLY FOR ANY SUMMARY AREA OF RESIDENCE WITHIN A PARTICULAR MUNICIPIO SUCH AS BARRIOS/PUEBLOS, (WITHIN THESE AREAS), BUT ARE NOT NECESSARILY DEFINED CONSISTENTLY FROM ONE SUCH AREA TO ANOTHER. THEREFORE, THESE DATA ARE NOT NORMALLY MEANINGFUL FOR SUMMARY AREAS OF RESIDENCE LARGER THAN THE MUNICIPIO. ONE EXCEPTION IS SMSA'S WHERE THE 1ST "N" DATA ITEMS WITHIN THE SMSA ARE CONSISTENTLY DEFINED. ITEM 22 IS MEANINGFUL FOR ALL SUMMARY AREAS OF RESIDENCE. THE 20 SPECIFIC WORK PLACES DEFINED FOR A MUNICIPIO ARE DOCUMENTED IN CENSUS OF POPULATION AND HOUSING, 1980: SUMMARY TAPE FILE 4 TECHNICAL DOCUMENTATION SUPPLEMENT 1--TABULATION PB34, PLACE OF WORK. IN THE TABULATIONS, "N" WILL VARY FROM SMSA TO SMSA AND WILL BE DOCUMENTED ALONG WITH THE REFERENCE LIST. (SEE SUPPLEMENT 1.)

FOOTNOTE SECTION

01 THE COUNT OF HOUSEHOLDS IN SAMPLE TABULATIONS MAY DIFFER FROM THE NUMBER OF OCCUPIED HOUSING UNITS. THIS IS A RESULT OF THE WEIGHTING PROCESS USED TO MINIMIZE DIFFERENCES BETWEEN COMPLETE COUNTS AND SAMPLE ESTIMATES. AN INDICATION OF THE TYPE OF WEIGHT (POPULATION OR HOUSING) FOR EACH MATRIX IS LISTED IN FOOTNOTE 40.

02 SEE FOOTNOTE 85.

03 SEE FOOTNOTE 85.

04 VACANT SEASONAL UNITS ARE EXCLUDED FROM ALL MATRICES EXCEPT AS NOTED SPECIFICALLY IN THE DOCUMENTATION.

05 SEE FOOTNOTE 68.

06 PERSONS MAY BE COUNTED MORE THAN ONCE IN THIS TABULATION.

07 A "CHILD OF HOUSEHOLDER" INCLUDES ANY SON, DAUGHTER, STEPCHILD, OR ADOPTED CHILD OF THE HOUSEHOLDER. AN "OWN CHILD OF HOUSEHOLDER" IS A NEVER-MARRIED CHILD UNDER 18 YEARS OF AGE WHO IS A SON, DAUGHTER, STEPCHILD, OR ADOPTED CHILD OF THE HOUSEHOLDER. "RELATED CHILDREN" INCLUDE NOT ONLY OWN CHILDREN BUT ALSO ALL OTHER FAMILY MEMBERS, REGARDLESS OF MARITAL STATUS, WHO ARE UNDER 18 YEARS OLD, EXCEPT THE HOUSEHOLDER OR SPOUSE. FOSTER CHILDREN ARE INCLUDED IN THE "NONRELATIVE" CATEGORY.

IN SUBFAMILIES AN "OWN CHILD" IS A NEVER-MARRIED CHILD UNDER 18 YEARS OF AGE WHO IS A SON, DAUGHTER, STEPCHILD, OR ADOPTED CHILD OF A MOTHER IN A MOTHER-CHILD SUBFAMILY, A FATHER IN A FATHER-CHILD SUBFAMILY, OR EITHER SPOUSE IN A MARRIED-COUPLE SUBFAMILY.

08 RELATIVES INCLUDE HOUSEHOLDER, SPOUSE, AND THE QUESTIONNAIRE CATEGORIES: "SON/DAUGHTER," "BROTHER/SISTER," "FATHER/MOTHER," AND "OTHER RELATIVE." TABULATIONS OF "OTHER RELATIVES" INCLUDE ALL CATEGORIES NOT SHOWN SEPARATELY IN THE MATRIX.

09 "NONRELATIVES" INCLUDE THE QUESTIONNAIRE CATEGORIES: "ROOMER, BOARDER," "ROOMMATE," "PAID EMPLOYEE," AND "OTHER NONRELATIVE." TABULATIONS OF "NON-RELATIVES" INCLUDE ALL CATEGORIES NOT SHOWN SEPARATELY IN THE MATRIX.

10 SEE APPENDIX 4 FOR DEFINITION OF LABOR FORCE STATUS CATEGORIES.

11 TABULATIONS OF POVERTY STATUS EXCLUDE INMATES OF INSTITUTIONS, PERSONS IN MILITARY GROUP QUARTERS AND IN COLLEGE DORMITORIES AND UNRELATED INDIVIDUALS UNDER 15 YEARS. (SEE ALSO FOOTNOTES

59 AND 71.)

12 THIS AGGREGATE, ALONG WITH THE RELEVANT COUNT, WILL PERMIT THE COMPUTATION OF A MEAN. FOR EXAMPLE, THE AGGREGATE VALUE FOR SPECIFIED OWNER-OCCUPIED NONCONDOMINIUM UNITS WILL YIELD THE MEAN VALUE WHEN DIVIDED BY THE COUNT OF SPECIFIED OWNER-OCCUPIED NONCONDOMINIUM UNITS, AND THE AGGREGATE ROOMS FOR OCCUPIED AND VACANT YEAR-ROUND UNITS DIVIDED BY THE COUNT OF OCCUPIED AND VACANT YEAR-ROUND UNITS YIELDS MEAN ROOMS. (SEE FOOTNOTE 52 PRIOR TO COMPUTING MEAN VALUE OR PRICE ASKED.)

13 THE FARM POPULATION IS DEFINED AS PERSONS LIVING IN RURAL TERRITORY ON PLACES OF 3 OR MORE CUERDAS FROM WHICH ANY FARM PRODUCTS WERE SOLD IN 1979 AND ON PLACES OF LESS THAN 3 CUERDAS FROM WHICH AT LEAST $100 WORTH OF FARM PRODUCTS WERE SOLD. FARM STATUS IS NOT APPLICABLE TO PERSONS IN GROUP QUARTERS. IF PERSONS IN GROUP QUARTERS ARE INCLUDED IN A MATRIX, THEY ARE TREATED AS NONFARM IF IN A RURAL AREA.

14 "LIVING WITH TWO PARENTS" IS DEFINED AS AN OWN CHILD IN A MARRIED-COUPLE FAMILY OR SUBFAMILY.

15 TABULATIONS OF "PERSONS IN HOUSEHOLD" BASED ON 100-PERCENT DATA BY DEFINITION ARE THE SAME AS TABULATIONS OF "PERSONS IN UNIT." THE PHRASE "PERSONS IN HOUSEHOLD" IS USED UNLESS THE MATRIX IS STRATIFIED BY A HOUSING ITEM SUCH AS TENURE, PLUMBING FACILITIES, ETC., IN WHICH CASE, THE PHRASE "PERSONS IN UNIT" IS USED. TABULATIONS OF "PERSONS IN HOUSEHOLD" AND "PERSONS IN UNIT" BASED ON SAMPLE DATA ARE NOT NECESSARILY THE SAME BECAUSE OF DIFFERENCES IN THE PROCEDURES USED TO INFLATE SAMPLE POPULATION AND HOUSING DATA.

16 "EVER MARRIED" INCLUDES THE QUESTIONNAIRE CATEGORIES: "NOW MARRIED," "CONSENSUALLY MARRIED," "SEPARATED," "WIDOWED," AND "DIVORCED."

17 SEE FOOTNOTE 85.

18 INCLUDES PERSONS 5 TO 20 YEARS OLD, NOT IN UNIVERSE FOR ACTIVITY 5 YEARS AGO.

19 "NOT REPORTED" MEANS PLACE OF WORK WAS NOT REPORTED AT ALL OR WAS NOT REPORTED AT LEAST TO THE MUNICIPIO LEVEL. IN TABULATIONS, "REPORTED CASES" THAT ARE NOT REPORTED TO THE AREA REQUIRED FOR A SPECIFIC TABULATION ARE TREATED AS REPORTED BUT AS WORKING OUTSIDE OF THAT AREA. FOR EXAMPLE, FOR PLACE OF WORK TABULATIONS AT THE PLACE LEVEL, IN A CASE WHERE THE PLACE OF WORK WAS REPORTED ONLY TO THE MUNICIPIO LEVEL, THE RESPONSE IS TALLIED

AS WORKING OUTSIDE OF THE PLACE.

20 SEE FOOTNOTE 85.

21 "PUBLIC TRANSPORTATION" INCLUDES "BUS," "PUBLIC CAR," "LAUNCH," AND "TAXICAB."

22 "YEAR ROUND" MEANS 50 TO 52 WEEKS; "FULL TIME" MEANS USUALLY 35 OR MORE HOURS PER WEEK.

23 VETERANS OF THE UNITED STATES ARMED FORCES ARE CLASSIFIED BY THE MOST RECENT PERIOD OF SERVICE, EXCLUDING PEACE TIME SERVICE, IN CASES WHERE THERE ARE MULTIPLE RESPONSES TO THE QUESTIONNAIRE ITEM.

24 HOUSEHOLDS MAY BE COUNTED MORE THAN ONCE IN THIS TABULATION.

25 IN THIS MATRIX, THE AGGREGATE INCOME FIGURES REFER TO THE AMOUNT OF INCOME FOR EACH SPECIFIC TYPE SEPARATELY (E.G., THE FIRST AGGREGATE SHOWS THE TOTAL AMOUNT OF WAGE OR SALARY INCOME RECEIVED BY HOUSEHOLDS IN 1979).

26 PERSONS 15 YEARS OLD ARE, BY DEFINITION, CLASSIFIED AS "DID NOT WORK IN 1979."

27 "AGGREGATE INCOME DEFICIT" IS THE SUM OF THE INDIVIDUAL DIFFERENCES BETWEEN THE POVERTY LEVEL (OR 125 PERCENT OF THE POVERTY LEVEL) AND TOTAL INCOME FOR FAMILIES OR UNRELATED INDIVIDUALS BELOW POVERTY LEVEL (OR 125 PERCENT OF THE POVERTY LEVEL).

39 PER CAPITA INCOME IS CALCULATED BY

DIVIDING THE AGGREGATE INCOME FOR PERSONS 15 YEARS AND OVER BY THE TOTAL NUMBER OF PERSONS IN THE GROUP.

40 EACH SAMPLE PERSON AND HOUSING UNIT WAS ASSIGNED A WEIGHT AS THE RESULT OF A COMPLEX RATIO ESTIMATION PROCEDURE. SAMPLE HOUSING UNITS WERE ASSIGNED ONE WEIGHT EACH AND SAMPLE PERSONS WERE ASSIGNED TWO TYPES OF WEIGHTS. THE FIRST WEIGHT FOR PERSONS APPLIES TO SAMPLE DATA EXCEPT PLACE OF WORK, TRAVEL TIME TO WORK, AND MIGRATION (I.E., RESIDENCE IN 1975) TABULATIONS; THIS WEIGHT WAS ASSIGNED TO ALL SAMPLE PERSONS. THE SECOND WEIGHT FOR PERSONS, WHICH APPLIES TO PLACE OF WORK, TRAVEL TIME TO WORK, AND MIGRATION DATA, WAS ASSIGNED TO THOSE SAMPLE PERSONS WHO WERE INCLUDED IN THE PLACE OF WORK AND MIGRATION CODING OPERATION. THESE WEIGHTS VARY FROM PERSON TO PERSON AND FROM HOUSING UNIT TO HOUSING UNIT, BUT ON THE AVERAGE THEY ARE APPROXIMATELY EQUAL TO THE INVERSE OF EACH RECORDS SAMPLE SELECTION PROBABILITY. THE TABULATIONS IN THIS FILE ARE BASED ON SUMMING THE WEIGHTS OF THE APPROPRIATE PERSONS OR HOUSING UNITS RELATING TO THE TABULATION. FOR SPECIFIED AGGREGATES, INDICATED BELOW, THE CHARACTERISTIC DATA ARE MULTIPLIED BY THE WEIGHT; FOR EXAMPLE, IN AGGREGATE INCOME FOR PERSONS THE AMOUNT OF INCOME IS MULTIPLIED BY THE WEIGHT. IN MEDIANS, THE WEIGHTS ARE BROUGHT TO BEAR INDIRECTLY THROUGH THE DISTRIBUTION USED TO CALCULATE THE MEASURE. FOR FAMILY AND HOUSEHOLD TABULATIONS (POPULATION TYPE), ONLY THE WEIGHTS OF THE HOUSEHOLDER ARE USED. FOR SUBFAMILY TABULATIONS, THE WEIGHTS USED ARE THOSE ASSIGNED TO THE SUBFAMILY REFERENCE PERSON (I.E., THE PERSON WHO IS THE EQUIVALENT OF A HOUSEHOLDER FOR THE SUBFAMILY). THE FOLLOWING IS A LISTING OF THE WEIGHTS USED IN PRODUCING EACH TABULATION:

OCCUPIED HOUSING UNITS ARE CLASSIFIED BELOW THE POVERTY LEVEL WHEN THE TOTAL 1979 INCOME OF THE FAMILY OR OF THE NONFAMILY HOUSEHOLDER IS BELOW THE APPROPRIATE POVERTY THRESHOLD. THE INCOME OF PERSONS LIVING IN A HOUSING UNIT WHO ARE NOT RELATED TO THE HOUSEHOLDER IS NOT CONSIDERED WHEN DETERMINING THE POVERTY STATUS OF AN OCCUPIED HOUSING UNIT. 1980 Census of Puerto Rico

DO	A1	A2	A4	A5 L	A6

Your answers are confidential

By law (title 13, U.S. Code), census employees are subject to fine and/or imprisonment for any disclosure of your answers. Only after 72 years does your information become available to other government agencies or the public. The same law requires that you answer the questions to the best of your knowledge.

U.S. Department of Commerce
Bureau of the Census
Form D-2E PR

A message from the Director,
U.S. Bureau of the Census . . .

We must, from time to time, take stock of ourselves as a people if our Nation is to meet successfully the many national and local challenges we face. This is the purpose of the 1980 census.

The essential need for a population census was recognized almost 200 years ago when the Constitution of the United States was written. As provided by article 1, population censuses of the United States have been taken every 10 years. As part of the 1980 Census of Population and Housing, as required by title 13, United States Code, the U.S. Bureau of the Census is conducting the census of Puerto Rico as of April 1, 1980.

The law under which the census is taken protects the confidentiality of your answers. For the next 72 years — or until April 1, 2052 — only sworn census workers have access to the individual records, and no one else may see them.

Your answers, when combined with the answers from other people, will provide the statistical figures needed by public and private groups, schools, business and industry, and Federal, Commonwealth, and municipal governments. These figures will increase the understanding of how the Puerto Rican population and housing are changing. In this way, today's problems can be dealt with more effectively.

The census is a vitally important activity for Puerto Rico. Please do your part by filling out this census form accurately and completely. A census taker will visit your household to pick up the form; please keep it in a safe, convenient place until then.

Thank you for your cooperation.
