Series P-60, No. 2

FAMILY AND INDIVIDUAL MONEY INCOME IN THE UNITED STATES: 1945

This report is the second publication of data on the distributions of the population by income level in 1945. The data are based on an inquiry conducted by the Bureau of the Census in April, 1946, as part of the Current Population Survey. Summary tables based on the same inquiry, and some comparative data for 1944 and 1939, were included in an earlier report, "Family and Individual Money Income in the United States: 1945 and 1944," Series P-S, No. 22, issued May 8, 1947.¹ Since the estimates are based on a sample, they are subject to sampling variability. The smaller figures, as well as small differences between figures, should be used with particular care, as explained in the section on reliability of estimates. Nevertheless, the relationships revealed by the data should be useful for analytical purposes. The nature of some of these relationships is indicated by the following paragraphs which give brief comments relating to the several tables.

About 1 out of 4 families and individuals² had total money income above \$3,500 in 1945. The median for all families and individuals was \$2,379. (See table 1.)

¹ Data relating to wage and salary income in 1939 have been presented in the following Sixteenth Census Reports on Population: Families: Size of Family and Age of Head; Families: Family Wage or Salary Income in 1939; Families: General Characteristics; Families: Characteristics of Rural-Farm Families; Families: Tenure and Rent; Families: Income and Rent; The Labor Force (Sample Statistics): Wage or Salary Income in 1939; and Vol. III, The Labor Force. In addition, special reports have been published: Per Capita Income in Wage-Earner Families, by Size of Family: 1939, Series P-44, No. 19, September 8, 1944; and Educational Attainment by Wage or Salary Income: 1940, Series P-46, No. 5, June 18, 1946.

² The definition of family used in this report is different from that used in other Census Bureau publications. A family is defined here as a group of two or more related persons residing in the same household. The term individual is used to refer to a person living alone or with persons not related to him. See section entitled "Definitions of terms and explanations."

The median money income of nonwhite families and individuals (\$1,294) was about one-half that of white families and individuals (\$2,491). (See table 1.)

The median total money income of families and individuals living in large places was appreciably higher than that of families and individuals in small towns and rural areas. The median declined from about \$3,100 for families and individuals in places of 1,000,000 or more population to about \$2,400 in urban places of under 25,000 population. (See table 2.)

Civilian money wages or salaries constituted only about one-third of total money income for families and individuals receiving from \$1 to \$499. On the other hand, they formed about four-fifths of total money income at the \$3,000-\$3,999 level, and seven-tenths of total money income at the \$6,000-\$9,999 level. (See table 4.)

The median total money income of families having 4 or more children under 18 years of age was about \$2,100, as compared with \$2,800 for those with 1 or 2 children. (See table 5.)

The median total money income of families with female heads was only about \$1,700, whereas that of families with male heads was about \$2,700. (See table 7.)

In "normal" families (male head, married, wife present) median total money income ranged from about \$2,000 if the head was under 25 years of age to about \$3,200 if the head was in the 45-to-54-age group, and then declined sharply to about \$1,500 in the 65-and-over-age group. (See table 8.)

Among nonfarm families and individuals the median total money income of those owning their homes (\$2,911) was appreciably higher than that of those renting their homes (\$2,513). (See table 9.)

Nonfarm families and individuals renting their homes and receiving from \$2,000 to \$2,999 paid

\$29 per month rent on the average, whereas those receiving twice as much, \$5,000 to \$9,999, paid only one and one-half times as much rent on the average (\$41). (See table 10.)

Among families and individuals receiving wages and salaries, median money income from this source was about \$2,300. This is considerably higher than the family and individual median money income from nonfarm self-employment, \$1,400, or from farm self-employment, \$600. If nonmoney receipts had been included in the definition of income, however, the median income from farm self-employment would have been raised by the value of home consumption of farm products. (See tables 11-13.)

The civilian money earnings of males were at their lowest level for those under 20 years of age (median, \$400). The median was about \$2,500 for males in the 35-to-39-age group, and was about \$1,200 for males in the 65-and-over-age group. (See table 15.)

The median civilian money earnings of males who were heads of "normal" families were about \$2,300, as compared with approximately \$700 for males who were not heads of such families. (See table 16.)

Female full-time civilian earners received only about \$1,500 on the average, as compared with a \$2,400 median for male full-time civilian earners. (See table 17.)

The median income from civilian money earnings of males who were supplementary earners in their families was about \$700, as compared with \$2,300 for principal earners. The median for female supplementary earners was about \$800, but the median for females who were principal civilian earners was only about \$1,200. (See table 18.) (The figures cited here are lower than those given in the previous paragraph because these figures relate to all earners, while those cited above relate to full-time earners.)

About four-fifths of all civilian earners received money wages or salaries as their sole source of earnings. (See table 19.)

The median civilian money earnings received in the mining (\$2,388), and the transportation, communication, and utilities (\$2,200) industries were among the highest. The lowest were in agriculture, forestry, and fishery (\$558) and in domestic and other personal services (\$497). In both of these latter industry groups, however, nonmoney income is important. (See table 21.)

CAUTIONS TO BE NOTED IN USING THE DATA

Because of differences in the definitions of income and the income-receiving units, as well

as differences in the universe to which the information pertains and in the sources of the data, the figures from this survey are not directly comparable with those derived from other sources. This point is discussed more fully in the section entitled "Comparability of census data with other income data." In addition, in comparing the data for farm units with those for nonfarm units, consideration should be given to the fact that the income figures presented in this report do not include nonmoney income, which is an important part of farm receipts.

DEFINITIONS OF TERMS AND EXPLANATIONS

Dates.--In the present report "1945" refers to the income data covering the calendar year 1945. (The survey was conducted in April, 1946.)

Dwelling unit and household.--A dwelling unit is defined, in general, as a room or group of rooms occupied or intended for occupancy as separate living quarters by a family or other group of persons living together or a person living alone. A household consists of a group of persons living together in a dwelling unit, usually with common housekeeping arrangements, though a household may include lodgers who get their meals elsewhere, or may consist of one person living alone. One schedule including all members of the household as of the date of interview was obtained for each household in the sample. Subgroups within the household were differentiated later on the basis of relationship:

The only persons included in the survey were those in households. Persons residing in quasi households (institutions, hotels, large rooming houses, etc.) were excluded. (See section entitled "Nature and size of the universe.")

Family.--The term "family" is not used here with the same meaning as in the 1940 census. The term "individual not in family" was not used in the 1940 census. The meaning adopted here is tentative and subject to revision. Comment is invited on any of the "family" and "individual" concepts used in this report.

The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing in the same household. All persons in a household who are related to each other are considered to belong to the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife who are not related to the head of

the household or an unrelated servant and his wife are considered as additional families, and not as part of the head's family. A household may therefore contain more than one family.

Individuals not in families.--The term "individuals not in families," as used in this report, refers to persons who are not related to any other person in the household. An individual not in a family may constitute a 1-person household by himself, or he may be part of a household including one or more other families or individuals. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household, and a servant living in an employer's household are examples of individuals not in families.

Primary or secondary families and individuals.--The term "primary family" refers to the head of a household plus any person in the household related to the head by blood, marriage, or adoption. If there is no person in the household related to the head, then the head of the household himself constitutes a primary individual not in a family. A household can contain only one primary family or primary individual not in a family. The term "primary families and individuals" is used in this report with the same meaning as the term "families" in the 1940 census.³

All persons who are not related to the head, such as lodgers or servants, are members of secondary families or are secondary individuals not in families. A group of persons who are related to each other but are not related to the head is a secondary family. Also, each individual in the household other than the head who is not related to any person in the household is a secondary individual not in a family.

Urban and rural classification.--For this report, the urban and rural areas are those that were so classified in 1940 on the basis of the results of the 1940 census. In the 1940 census, all incorporated places having 2,500 inhabitants or more were classified as urban, together with certain other areas declared urban by special rule. All other areas were classified as rural.

The classification of rural population as farm and nonfarm is based on residence at the time of enumeration. Thus, the population classified as rural-farm in this report is the population living on farms at the time of enu-

meration in areas that were classified as rural in 1940. The population classified as rural-nonfarm in this report is the population not living on farms at the time of enumeration in areas that were classified as rural in 1940.

Size of place.--The classification by size of place, like that by urban and rural residence, is based on the size of the place in 1940.

Total money income.--Total money income is the algebraic sum of the net money earnings from civilian employment (including wages and salaries and the net income from farm and nonfarm business and professional self-employment), armed forces pay, and net money income other than earnings. It does not include income received in kind, such as the value of home-produced food, meals, or rent-free living quarters. Nor does it include the value of farm inventory changes or farm depreciation charges. Furthermore, it does not include capital gains or losses or imputed income from the use of owned durable consumer goods (such as dwellings, automobiles, and furniture). And, finally, it does not include depletion of assets (such as withdrawals from savings accounts) or increases in liabilities (such as money borrowed).

The informant was asked to report the amount of money income of each of the following specified types received during the calendar year 1945 by each person 14 years of age and over residing in the dwelling unit at the time of interview, and the amount of each type of income was entered separately for each person:

1. Civilian wages or salaries.
2. Net income from nonfarm self-employment.
3. Net income from farm self-employment.
4. Armed forces pay, excluding dependency allotments.
5. Dependency allotments and contributions from members of the armed forces.
6. Veterans' payments.
7. Old-age and survivors insurance, non-veteran unemployment compensation, and workmen's compensation.
8. Net rental income.
9. Net income from roomers and boarders.
10. Interest and cash dividends.
11. Net other income.

A more complete description of the 11 specific types of income is given below:

1. Civilian wages or salaries. These are defined as the money earnings received for work performed as a civilian employee during the calendar year 1945. They include wages, salaries, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for

³ See Families: Family Wage or Salary Income in 1939, p.3.

taxes, bonds, pensions, union dues, etc. Payments made in kind rather than in money, such as living quarters, meals, and clothes, are excluded, primarily because of the difficulty of evaluating them.

2. Net income from nonfarm self-employment. This item is defined as net money income (gross receipts minus expenses) from a business or professional enterprise in which the person was engaged on his own account or as an unincorporated employer. Gross receipts include the value of all goods sold and services rendered and the value of any net inventory increase. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, value of any net inventory decrease, wages and salaries paid, business taxes, etc.

3. Net income from farm self-employment. Net earnings of a farm or ranch operator are computed as the total money receipts from the enterprise, less all money expenses incurred in operating it. In general, living expenses have not been deducted. Certain expenses, however, such as taxes, interest, and insurance (which were in part incurred by the farm living quarters, and not solely by the farm business) have been deducted in their entirety, thus exaggerating the farm expenses in some instances. Neither depreciation charges nor inventory changes are included among the items considered in arriving at net income. The value of food produced and consumed at home is also excluded. The basic reasons for excluding depreciation, inventory changes, and home-produced food are the inherent difficulties of obtaining and of evaluating them.

4. Armed forces pay, excluding dependency allotments. This includes the total armed forces pay earned during the calendar year after deductions for class "F" or dependency allotments, but before soldiers' deposits, class "E" or voluntary allotments, or other deductions for expenses are made. Officers' terminal leave pay and cash allowances for subsistence are included in armed forces pay.

5. Dependency allotments and contributions from members of the armed forces. Both dependency and other allotments or contributions received from members of the armed forces are included here unless the member of the armed forces who made the allotments or contributions was residing in the household at the time of interview. In the latter case, all except the dependency allotments are excluded, because the inclusion of the class "E" allotments or other contributions would involve double-counting.

6. Veterans' payments. These include mustering-out, unemployment, disability, and other similar payments.

7. Old-age and survivors insurance, non-veteran unemployment compensation, and workmen's compensation.

8. Net rental income. Rental income is defined as the cash rents received, less the costs incurred by the landlord in connection with the property. Costs include depreciation charges.

9. Net income from roomers and boarders. This is defined as the gross receipts, less all expenses, such as food served to boarders, laundry, a share of the wages paid to a servant for cleaning, cooking, etc., and a share of the rent paid for the house (or of the taxes, depreciation, interest, and other costs, if the house is owned).

10. Interest and cash dividends. All interest and dividends which were paid or were drawable in cash are included here. Interest on Series E war bonds is not included unless the bonds had been redeemed.

11. Net other income. The following miscellaneous types of receipts are included here:

a. Income of children under 14 years of age. Such income is arbitrarily allocated to the head of the unit, and is classified under "Net other income."

b. Cash amounts received from public and private relief agencies, aid to the blind and other handicapped, old-age assistance, and aid to dependent children.

c. Periodic payments from paid-up endowment insurance policies, annuities, trust funds, or inheritances, or from life insurance policies of deceased persons (including payments received from war insurance). Lump-sum payments are excluded.

d. Receipts representing interest on insurance and trust funds.

e. Royalties from copyrights, patents, and mineral and oil rights.

f. Alimony.

g. Net receipts from a business owned but not operated by the person.

h. Contributions for support received from persons (other than members of the armed forces) not in the household at the time of interview.

Civilian earnings.--Civilian earnings are the sum of civilian wages and salaries, net income from nonfarm self-employment, and net income from farm self-employment. The presence of large numbers of veterans in the sample, some of whom could have had no civilian employment and some of whom could have had civilian employment for only part of 1945, requires exercise of caution in interpreting the civilian earnings distributions.

Total money income.--The total money income of a person represents the algebraic sum of the amounts of all types of income received by the person. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

With a few exceptions, if the amount of any type of income was \$10,000 or more, it was recorded as "\$10,000 or more" rather than as a specific amount.

Age.--The age classification is based on the age of the person at his last birthday before April 1, 1946, that is, age in completed years.

Children under 18 years of age.--The count of children under 18 years of age does not include a head or wife under 18.

Color.--Families are classified as white or nonwhite in accordance with the color of the head. Persons of Mexican birth or ancestry not definitely Indian or of other nonwhite race are counted as white.

Extent of civilian employment.--Civilian employment is defined here as work for pay or profit excluding (1) unpaid work on the family farm or in the family business, (2) work for payment "in kind," and (3) service in the armed forces. Full-time civilian earners are persons who worked a full year. In general, "full" is what the respondent considered a full-time job throughout the year. Time spent on vacation was to be considered as time worked, as well as short periods away from work on account of illness, labor dispute, or plant shut-down. School teachers who completed their contract for the school year are classified as full-time civilian earners even though they did not work during the summer vacation.

Head of family.--One person in each family, usually a married man and the chief breadwinner, was designated as the head, being usually the person regarded as head by the members of the household. Females were not designated as heads of family if their husbands were members of the household at the time the inquiry was made.

Major occupation group and major industry group.--The major occupation group and the major industry group by which an earner is classified are based on the occupation and industry which the earner reported as his major source of civilian earnings in 1945. The groupings used here are the same as those used in the 1940 census. The occupational and industrial com-

position of each major group is shown in Volume III of the 1940 Census Reports on Population and in the third series State bulletins on Population.

Principal and supplementary civilian earners.--The principal civilian earner in a family is the person who received the most civilian earnings during 1945. All other civilian earners in the family are supplementary civilian earners.

Rent.--The rent data represent the reported monthly contract rent of tenant-occupied dwelling units at the time of interview.

Marital status of head.--The marital status of the head of the family refers to the marital status at the time of interview.

Tenure.--Families and individuals are classified by tenure into two groups: Owner and renter. All secondary families and individuals are classified as renters. Primary families and individuals are classified as owners if the dwelling unit occupied was owned wholly or in part by the head of the primary family (or by a primary individual not in a family) or by some related member of his family. All other primary families and individuals are classified as renters whether or not cash rent was actually paid for the living quarters. Families and individuals residing in rent-free quarters or in living accommodations which were received in payment for services performed are thus included with the renter families and individuals.

Nonreporting of income.--Approximately 19.6 percent of the families and individuals lacked data on one or more component income items. These families and individuals are classified as "not reporting" and are shown by various characteristics in tables 26-29. For a discussion of the probable effects of nonreporting, see the section entitled "Reliability of estimates."

Medians.--The median income is the amount which divides the families and individuals into two equal groups, one having incomes above the median, and the other having incomes below the median. In the case of the total income of families and individuals the median computation was based on all cases. In the other tables of this report the median computation excludes the families or individuals who did not have earnings of the specified type, because in each of these cases the principal interest is usually in the medians for the families or individuals reported as engaged in that type of remunerative activity.

Percentages.--Percentages are shown to the nearest tenth, as calculated; therefore they do not always add up to exactly 100.0 percent. The totals, however, are always shown as 100.0 percent.

Dashes and asterisks.--A dash (-) in a table either means "zero" or indicates that the classification does not apply. An asterisk (*) in a table is used to indicate that no figure is shown because the number of inflated cases in the base was considered to be too small to be stable (less than 500,000).

Comparison with earlier release.--There are minor differences between the figures in this report and in the earlier release, Series P-S, No. 22. The figures in the present report are final.

NATURE AND SIZE OF THE UNIVERSE

The universe from which the sample was selected for the study of 1945 income was the population of the United States residing⁴ in private households on the date of interview, i.e., in April, 1946. Persons in the following categories were not included:

1. Persons living in large lodging houses, i.e., in places having 10 or more rooms or suites of rooms rented or available for rent to roomers.
2. Residents of hotels, YMCA's, YWCA's, YMHA's, fraternity and sorority houses, and similar places.
3. Residents of trailer camps, labor camps, logging camps, houseboats, ships, etc. (Residents of tourist camps and individual trailers were included.)

⁴ Persons were considered to be residing at a given address if they were: (1) Persons who usually slept in the dwelling unit and were (a) present at the time of enumeration, (b) absent but intended to return within 60 days, or (c) absent for any period because they were travelling on business or were attending school; (2) others who did not usually sleep in the unit but were present at the time of enumeration and intended to remain for 60 days or more, provided these persons were not away from their usual residence while travelling on business or attending school.

4. Members of the armed forces and civilian personnel living on military reservations. (Members of the armed forces living in private households were included.)

5. Inmates and noninmate residents of institutions (hospitals, sanatoriums, rest homes, religious establishments, penal institutions, etc.).

The total number of persons not included in the universe from which the income sample was drawn represents roughly 1 to 2 percent of the total civilian population of the United States.

An independent Bureau of the Census estimate indicates that the number of private households in the United States on April 15, 1946, was 38,025,000.⁵ The number of schedules obtained in the 1945 study (each schedule representing one private household) was inflated to this figure.

A summary of the coverage of families and persons is shown in tables A and B.

The composition of families was taken as found at the time of interview. Thus, a family would not include a person who had been a member of the family in 1945 but who was not a member at the time of interview. On the other hand, it would include a person who had not been a member in 1945 but who was a member at the time of interview. The exclusion of persons who were not members of the family at the time of interview understates both the number of persons and the amount of income for the families affected. The inclusion of persons who were not members of the family in 1945 overstates the family size and amount of income.

In April, 1946, when the 1945 income data were collected, a very large number of veterans were included in the sample who were either not members of any family in 1945 or were members for only part of 1945. Their entire 1945 income, however, was included.

⁵ This estimate was made in terms of the 1940 census definition of private households. This definition was sufficiently similar to that used in the 1945 study to justify the use of the 1940 definition in the determination of the control figure to which the 1945 sample data were inflated.

Table A.--PRIMARY AND SECONDARY FAMILIES AND INDIVIDUALS IN PRIVATE HOUSEHOLDS BY TYPE OF UNIT, FOR THE UNITED STATES, URBAN AND RURAL: 1945

(Numbers in thousands)

RESIDENCE	FAMILIES AND INDIVIDUALS			FAMILIES			INDIVIDUALS NOT IN FAMILIES

*Less than 500.

Table B.--PERSONS 14 YEARS OF AGE AND OVER IN PRIVATE HOUSEHOLDS BY SEX, FOR THE UNITED STATES, URBAN AND RURAL: 1945

(Numbers in thousands)

RESIDENCE	Both sexes	Male	Female
United States.....	98,524	46,075	52,449
Urban.....	61,327	27,808	33,519
Rural-nonfarm.....	19,565	9,307	10,258
Rural-farm.....	17,632	8,960	8,672

NATURE AND SIZE OF THE SAMPLE

Income schedules were collected from a cross section of the Nation's private households in 68 areas comprising 125 counties in 42 States and the District of Columbia. The income sample was a systematic subsample of the Current Population Survey sample which is used to obtain figures for the Monthly Report on the Labor Force.⁶ The income sample comprised 8,685 households in which there were 9,295 families and individuals. These included 22,580 persons 14 years of age and over.

RELIABILITY OF THE ESTIMATES

Since the estimates are based on sample data, they are subject to sampling variability. The sampling variability of an estimated percentage may be relatively large when the percentage is small or when the total on which the percentage is based is small. The sampling variability of an estimated median depends upon both the size and the form of the distribution on which it is based. The following table indicates the sampling errors of estimated percentages and medians from selected distributions.

⁶ A detailed description and explanation of the Current Population Survey sample is given in A New Sample of the Population, by Morris H. Hansen and William N. Hurwitz, Bureau of the Census, September, 1944.

Table C.--SAMPLING VARIABILITY OF SELECTED ESTIMATED PERCENTAGES AND MEDIANS

ITEM	Sample estimate	The chances are about 19 out of 20 that the figure which would have been obtained from a complete census is between:
TABLE 1		
Total, families and individuals, percent in \$1,000-\$1,499 income level.....	9.1%	8.1% - 10.1%
Urban, families, percent in \$2,000-\$2,499 income level.	12.7%	11.3% - 14.1%

Table C.--SAMPLING VARIABILITY OF SELECTED ESTIMATED PERCENTAGES AND MEDIANS--Continued

ITEM	Sample estimate	The chances are about 19 out of 20 that the figure which would have been obtained from a complete census is between:
TABLE 1--Continued		
Rural-nonfarm, families, percent in \$5,000-\$5,999 income level.....	4.0%	2.6% - 5.4%
Rural-farm, families and individuals, percent in \$500-\$999 income level.....	18.9%	15.6% - 22.2%
Rural-farm, nonwhite, families, percent in \$0-\$499 income level.....	46.5%	26.9% - 66.1%
TABLE 5		
Urban, families with 4 or more children, percent in \$2,500-\$2,999 income level.	17.4%	10.8% - 24.0%
TABLE 17		
Rural-farm, female, full-time civilian earners, percent in \$1-\$499 civilian money earnings level.....	31.1%	21.1% - 41.1%
TABLE 1		
Total, families, median income.....	\$2,621	\$2,531 - \$2,711
Rural-farm, families and individuals, median income....	\$1,291	\$1,104 - \$1,478
Rural-nonfarm, white, families, median income.....	\$2,498	\$2,350 - \$2,669
TABLE 20		
Professional and semiprofessional workers, both sexes, median civilian money earnings.....	\$2,201	\$1,976 - \$2,426
Farmers and farm managers, male, median civilian money earnings.....	\$ 809	\$ 635 - \$ 984
Service workers, except domestic and protective, female, full-time, civilian money earnings.....	\$1,385	\$1,149 - \$1,583

The sampling errors of estimates of some other major income characteristics are shown in "Sampling Variability of Estimates of Family and Individual Money Income in the United States in 1945," release Series P-S, No. 22-S (available on request).

In addition to sampling variations, the figures are subject to errors of response and to nonreporting. In most cases the schedule entries for income are based on memory rather than on records, and in the majority of instances on the memory or knowledge of some one person, usually the wife of the household head. The memory factor may result in responses that have two possible types of variation. Some responses on the amount of income may vary from the true

figure in a random manner. In a fairly large sample, this type of error tends to cancel out without producing a bias. Other responses may have a bias, either downward or upward. Such a bias would not be eliminated even with a complete enumeration. The memory factor in data derived from field surveys of income probably produces underestimates, because the tendency is to forget irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstandings as to the scope of the income concept.

Nonreporting of income, i.e., the failure to obtain any or all the income information due to the refusal, absence, or poor memory of the informant, may occur at any income level. If such nonreporting of income occurred in the same proportion in all parts of the distribution, no distortion of the income distribution would result solely from this phenomenon. However, there is considerable evidence that nonreporting is more prevalent at the upper income levels, so that the estimated proportion of cases in these levels is smaller than it should be.

The adjustment of an income distribution for biases is a difficult undertaking and one justifying an entirely independent study.⁷ All income figures presented here are, accordingly, based on replies received from the respondents interviewed, and contain no adjustments involving independent sources of data.

COMPARABILITY OF CENSUS DATA WITH
OTHER INCOME DATA

Department of Commerce income payments series.--The income payments series of the Department of Commerce is a measure of the income received by residents of the United States from business establishments and governmental agencies. Its purpose is to show aggregate income payments, whereas the purpose of the census data is to show the size distribution of income payments. As a net result of the differences outlined below, the aggregates which may be derived from the census data will be considerably smaller than the income payment aggregates.

1. The definitions of income are different. The income payments series includes the following items which are not included in the Census definition: Income in kind; net change of farm inventories; and interest received by banks and other financial intermediaries. The Census definition of income includes the follow-

ing items which are not included in the income payments series: Military pay and allowances received abroad in 1945 by persons residing in private households in the United States at the time of interview, and contributions for support received from persons who are not members of the household.

2. The income payments series includes the income of all persons who were in the continental United States during 1945. The Census excluded from its sample persons in institutions and quasi households (such as large rooming houses and hotels) and military personnel living on post. In addition, the income of those who died or emigrated prior to the date of interview was not reported in the Census inquiry.

3. The Census did not record the specific amount of income for those persons who received \$10,000 or more income of a given type.

4. The income payments series is estimated largely on the basis of such record data as Old-Age and Survivors Insurance wage records, corporation income tax returns, governmental payments, etc. The Census data, on the other hand, are based on information obtained in a field survey, and such information is largely dependent on memory.

National Survey of Liquid Assets.--The National Survey of Liquid Assets, like the Census survey, obtained data on the size distribution of income for 1945. There is one major difference between the two inquiries, namely, the definition of the income-receiving unit. The Census "family" includes all persons in a household who are related by blood, marriage, or adoption. The Liquid Assets Survey used a "spending unit" concept, those household members who had incomes which they used for their own purposes constituting separate spending units. The result was to increase the number of spending units relative to the number of families as defined in the Census survey, thereby decreasing the median income, and increasing the proportion of cases at the lower income levels. The Liquid Assets Survey data were retabulated according to the Census definition of income-receiving unit, and it was found that the median income of all families and individuals did not differ significantly from that of the Census.⁸

Bureau of Labor Statistics 1944 data on the income of city families.--The Bureau of Labor Statistics has published estimates of the dis-

⁷ Such a study is now being undertaken as a joint project by the Departments of Agriculture, Commerce, and Labor, under arrangements established by the Bureau of the Budget.

⁸ "Survey of Consumer Finances, Part II, Consumer Income and Liquid Asset Holdings," Federal Reserve Bulletin, July, 1947.

tribution of income among city (urban) families in 1944. The primary difference in method between the Census Bureau and the Bureau of Labor Statistics is that the Bureau of Labor Statistics endeavored to reconstruct families as they had been constituted during the income year while the Census Bureau enumerated families as they existed at the time of interview. In addition, the Bureau of Labor Statistics obtained expenditure data at the same time and, therefore, probably achieved more nearly complete reporting of income data.

Federal income tax data.--The Federal income tax coverage is incomplete because of the exemptions of persons receiving less than \$500; therefore, its coverage differs from the Census coverage.

Since some of the income tax returns are filed as separate returns and others as joint returns, the income reporting unit is not consistently on the basis of either families and individuals or persons.

Income as defined for tax purposes differs from the Census concept. For example, armed

forces pay of under \$1,500 is excluded from income tax data as are a number of other types of receipts such as veterans' payments, social security benefits, and relief payments, which constitute the main income sources for some families.

Old-Age and Survivors Insurance Wage record data.--Census data and the distributions made upon the basis of Old-Age and Survivors Insurance wage record data differ for the reasons listed below.

1. The Old-Age and Survivors Insurance data are available only in terms of persons, not in terms of families and individuals.

2. The wages and salaries of such groups as domestic servants, farm laborers, employees of nonprofit institutions, and governmental employees are not covered by the wage record data.

3. No wages or salaries received from any one employer in excess of \$3,000 are covered by the wage record data.

4. Income other than wages or salaries is not covered by the wage record data.
