

CURRENT POPULATION REPORTS

POPULATION ESTIMATES

FOR RELEASE

December 28, 1953

Washington 25, D. C.

Series P-25, No. 87

ESTIMATES OF THE CIVILIAN POPULATION OF STATES, BY BROAD AGE GROUPS JULY 1, 1950, 1951, AND 1952

(The estimates given in this report for 1950 and 1951 supersede the corresponding estimates published in Current Population Reports, Series P-25, Nos. 64, 66, and 68)

Estimates of the civilian population of States in four broad age groups are presented in this report: Under 5 years old (preschool-age children), 5 to 17 years old (school-age children), 18 to 64 years old (adults of working age), and 65 years old and over (the elderly). These estimates are based on age data from the 1950 Census; statistics of births and deaths provided by the National Office of Vital Statistics, United States Public Health Service; statistics on the movement of persons into and out of the United States provided by the Immigration and Naturalization Service, Department of Justice; statistics relating to the Armed Forces provided by the Department of Defense; and estimates of net interstate migration, developed in part from official records of school enrollment obtained from State and Diocesan Departments of Education throughout the country.

The estimates were obtained by adjusting the 1950 Census data on each of the age groups for the United States, and for each State for births (only the age group under 5 years old is involved here), civilian deaths, net civilian international and interstate migration between April 1, 1950, and the estimate dates, and net movement of civilians into the Armed Forces for the same periods. Finally, the estimates of the population of the four age groups for each State were adjusted proportionately to add to the total population of the State.

The data on births available for preparing these population estimates include final figures classified on a residence basis for 1950 and provisional figures classified on an occurrence basis for 1951 and 1952. The 1951 and 1952 "occurrence" figures were estimated to a residence basis. All figures were corrected for underregistration on the basis of the preliminary results of the 1950 Birth Registration Test conducted by the National Office of Vital Statistics in conjunction with the 1950 Census of Population. The estimates of deaths used in preparing these population estimates were developed from estimates of deaths classified by age, for the United States as a whole for 1950 to 1952, and from tabulations of resident deaths classified by age, for each State for 1949. The adjustment of the death statistics for underregistration was confined to infants under one year of age. The final figures on births and deaths are expected to differ only slightly from those used.

The net movement of civilians into the Armed Forces for each State was estimated by (1) taking the difference between (a) the number of persons serving in the Armed Forces on the estimate date who reported the State as their preservice residence and (b) the number serving in the Armed Forces on April 1, 1950, who reported the State as their preservice residence, and (2) adding an allowance for former residents

of the State who died during this period while serving in the Armed Forces.

The estimates of net migration were developed basically by the method described as "Method II" in Population--Special Reports, Series P-47, No. 4, and illustrated in Current Population Reports, Series P-25, No. 20. This method involves first the estimation of net migration rates for children 6 to 13 years old on the basis of data from the 1950 Census and statistics of elementary school enrollment. Net migration rates for children 6 to 13 years of age had already been developed for use in preparing the estimates of the total population of States presented in Current Population Reports, Series P-25, No. 84. It was uniformly assumed in preparing the estimates of the population of each of the age groups shown in this report that the rate of net migration for the population in each of these groups between April 1, 1950, and the estimate dates for a given State bore the following relationships to the rate for school-age children of the same State 6 to 13 years of age:

Age group	Ratio of migration rate for age group to that for group 6 to 13 years old
Under 5 years.....	1.7
5 to 17 years.....	1.0
18 to 64 years.....	1.3
65 years and over....	0.3

The estimates of net civilian migration for each age group for States were adjusted by a ratio method to add algebraically to the national estimate of net immigration in the particular age group for the same period. Evidence for the above assumptions concerning migration by age was found in annual interstate migration data classified by age for the United States as a whole for recent years obtained in the Current Population Survey.

The estimates of the population 5 to 17 years old presented in this report are believed to have relatively high accuracy, because they are based on direct, or symptomatic, data for all the components of population change for the age group under consideration. The estimates

of net migration, in particular, are based on school enrollment data relating to very nearly the same age group as is being estimated. The general method used to estimate net migration does not involve, therefore, for the age group 5 to 17 years old, such broad assumptions as to the relation between the migration rate of elementary-school-age children and the migration rate of persons in the age group, as it does for the total population or the age groups outside the school ages.

All the States with the exception of Arkansas showed increases in the number of school-age children between 1950 and 1952. Arkansas was the State with the largest percentage loss in total population (4.4 percent) in this period. The five States with increases of 15 percent or more in the number of school-age children were Nevada (21.0 percent), Arizona (17.4 percent), Florida (17.1 percent), California (15.5 percent), and Delaware (14.8 percent). All these States were also among the leaders in increases percentage-wise in total population because of the high migration rates to these States between 1950 and 1952.

The assumptions made as to net interstate migration for the other three age groups are so broad that only relatively large differences in percentage change among States for these age groups can be relied upon. The estimates of the population of these age groups are valuable mainly as indicators of population levels and of broad patterns of change. Because of the nature of the migration assumption, changes by States in each of the four broad age groups are fairly highly correlated with changes in the population of all ages over the same period.

Nearly all of the States had gains in the number of children of preschool age and in the number of elderly persons. Some of these States had losses in total population. Only about one-third of the States had population gains for the age range 18 through 64. Some of the States that had a gain in total population lost population in these ages of prime economic activity. The changes in this age group were affected by losses to the Armed Forces over the period.

LIST OF TABLES

Table	Page
1.--Estimates of the civilian population of regions, divisions, and States, by broad age groups: July 1, 1952.....	3
2.--Estimates of the civilian population of regions, divisions, and States, by broad age groups: July 1, 1951.....	4
3.--Estimates of the civilian population of regions, divisions, and States, by broad age groups: July 1, 1950.....	5
4.--Estimates of the civilian population of regions, divisions, and States, by broad age groups: April 1, 1950.....	6
5.--Estimates of the percent of change in the civilian population of regions, divisions, and States, by broad age groups: April 1, 1950, to July 1, 1952.....	7

Table 1.--ESTIMATES OF THE CIVILIAN POPULATION OF REGIONS, DIVISIONS, AND STATES, BY BROAD AGE GROUPS: JULY 1, 1952
 (Each estimate has been independently rounded to the nearest thousand from figures computed to the last digit; hence, the sums of parts shown may differ slightly from the totals shown)
