ESTIMATES OF THE POPULATION OF STATES, BY AGE, 1960 TO 1966

With Provisional Estimates for July 1, 1967

(Estimates shown here supersede corresponding estimates published in report No. 354 of this series)

This report presents estimates of the total resident population by age groups for 1960 to 1967. The age groups shown for 1960 to 1966 are: under 5 years, 5 to 17 years, 18 to 44 years, 45 to 64 years and 65 years and over, plus the cumulative age groups 14 years and over, 18 years and over, and 21 years and over. For 1967, the age groups shown are: under 18 years, 18 to 64 years, and 65 years and over, plus the cumulative age groups 18 years and over and 21 years and over.

METHODOLOGY

Estimates for 1966.—The estimates for all States were obtained by carrying forward the 1960 Census data (after subtracting the estimated size of the Armed Forces) for each of the age groups for each State, and allowing for births, deaths, net civilian international and interstate migration, the net movement of civilians into the Armed Forces between April 1, 1960, and the estimate date, and the number of Armed Forces stationed in each State on the estimate date. As a final step, the estimates were so adjusted that the sum of the estimates of the five broad age groups for each State equaled the estimate of the total resident population of that State published in Current Population Reports, Series P-25, No. 380. In addition, the sum of the State estimates for each age group was adjusted to equal the latest national population estimates in that age group.¹

¹National population estimates, by age, for 1966 are published in Series P-25, No. 385.

To estimate net civilian migration for a State, rates of migration were derived for each age group except age 65 years and over from the State's estimated migration rate for school-age children for the period April 1960 to July 1966. Specifically, the net civilian migration rate, 1960 to 1966, for each age group in a given State was derived by (1) obtaining the ratio of the national gross interstate migration rate for that age group to the national rate for the age group 7.50 to 15.49, and (2) applying this ratio to the State's net migration rate for the age group 7.50 to 15.49.

Net migration rates for ages 7.50 to 15.49 by States had previously been estimated in the course of preparing the estimates of the total population of States for 1966 shown in Current Population Reports, Series P-25, No. 380. (The method used in estimating migration rates for children of school age is described in that report. It employs data on elementary school enrollment and data on age from the 1960 Census.)

The national interstate migration rates are based on estimates of interstate migration by age obtained annually from the Current Population Survey, the Bureau's continuing national sample survey of population.² The ratios of the national migration

²U.S. Bureau of the Census, Current Population Reports, Series P-20, No. 156, "Mobility of the Population of the United States: March 1965 to 1966," December 9, 1966, and the corresponding reports for earlier years of the decade.

rates for broad age groups to the rates for the school-age population 7.50 to 15.49 for the period April 1960 to July 1966 are as follows:

<u>Age group on estimated date</u>	<u>Ratio</u>
Under 5 years.	0.686
5 to 17 years	1.022
18 to 44 years.	1.503
45 to 64 years.	0.491

These are relationships among gross interstate migrants for the United States as a whole. Obviously, migration ratios for individual States may vary from the National ratios; however, annual migration figures for States are not available. Moreover, the net ratios by age could well differ from the ratios of gross rates. Nonetheless, it is assumed here that these same ratios apply equally to all States, and also for a given State, that the direction of the net migration is the same for all of the broad age groups under 65.

Examination of the Current Population Survey material on annual interstate migration has indicated that given the specific age pattern of migration rates shown by the Current Population Survey for the last several years, the ratio of the net migration rate of a particular age group to the net migration rate of the "school-age" population (7.50 to 15.49) will vary with the length of the estimating period. Thus, the ratio of a 6-year period is different from the corresponding ratio for a 1-year period. The procedure developed to derive the ratios shown above is as follows: Annual migration rates by single years of age for each year 1960 to 1966 were derived by graphic interpolation of the data for broad-age groups for each year provided by the Current Population Survey. The interpolated migration rates were then applied to annual estimates of population by single years of age, and the resulting estimates of the number of migrants in each year of age were cumulated by cohort as required for the estimating period. For example, the number of persons 45 to 64 years of age on July 1, 1966 who had migrated during the period April 1, 1960 to July 1, 1966, was derived by summing the number of persons 45 to 64 years old on July 1, 1966 who had migrated between July 1, 1965 and July 1, 1966; the number 44 to 63 years old on July 1, 1965, who had migrated between July 1, 1964, and July 1, 1965; and so on to April 1, 1960. The number of migrants was then converted into a migration rate by dividing by the appropriate population in 1960. In a similar manner, migration rates for the period April 1, 1960, to July 1, 1966, were computed for the "school-age" group. The migration rate for the "school-age" children was then divided into the migration rates for these age groups to derive the ratios shown above.

Estimates of the migration between States of the group 65 years old and over were based on data on the interstate migration of "aged beneficiaries" for each State for the fiscal years 1959-60, 1964-65 and 1965-66 obtained from the Social Security Administration. (Since data on interstate migration of aged beneficiaries were not available for the intervening years, it was assumed that the average annual migration of these three years prevailed throughout the 1960-66 period.) The reported numbers of beneficiaries who migrated were adjusted for differences between States in insurance coverage, and the State estimates were adjusted to tie in with the level of interstate migration of persons aged 65 and over for the United States for the period from April 1960 to July 1966, as estimated from the Current Population Survey.

The initial migration estimates derived for the age groups in each State were adjusted to be consistent with independent State migration totals for all ages implied in the State estimates published in Current Population Reports, Series P-25, No. 380. The effect of this adjustment on the age estimates is discussed in the section "Accuracy of estimates" below.

The net movement of civilians into the Armed Forces for each State was estimated for each age group by subtracting (1) the number of persons in that age cohort serving in the Armed Forces on April 1, 1960, who reported the State as their preservice residence from (2) the number of persons in the age group serving in the Armed Forces on the estimate date who reported the State as their preservice residence. To this was added an allowance for former residents of the State in the age cohort who died during this period while serving in the Armed Forces.

Estimates for 1961 to 1965.--Estimates for July 1, 1961 to 1965, were derived in the same manner as those for July 1, 1966.

Provisional estimates for 1967.--The estimates for July 1, 1967, were also derived by a component approach similar to that used for preparing the estimates for 1966. Here, however, data by age for the components of population change were not available for the period beyond July 1, 1966. Provisional estimates of the total population of States for July 1, 1967, and of the components of change (i.e., births, deaths, net civilian migration, and movement of civilians into the Armed Forces) for the period April 1, 1960, to July 1, 1967 had already been developed in connection with 1967 State totals published in Series P-25, No. 380. Consequently, each of these components was then distributed to appropriate age cohorts, using as a basis for

distribution the data by cohort developed in connection with the July 1, 1966, estimates described above. The estimates were also adjusted so that the total population of each State agreed with the provisional State total and the sum of each age group for States agreed with the latest national population estimates for these groups.

POPULATION BASE

This report makes use of the 1960 population, by age, published in table 16, Volume I of the 1960 Census of Population, for each State. In the use of the census numbers in the preparation of current estimates, by age, there has been no adjustment for net undercounts, either in the national or State data, although it is recognized that there were both underenumeration and misreporting in the census.³ The evaluation studies relating to the 1960 Census are still under way, and as yet there is no definitive measure of net underenumeration for the total population nor of net undercounts for most age groups. The results of the 1960 Census Evaluation and Research Programs are being published in Series ER-60 and in various special papers; some initial results have been published and additional results will be published as they become available.⁴

SOURCES OF DATA

The estimates given in this report are based on age data from the 1960 Census; statistics on births and deaths provided by the National Center for

Health Statistics, U.S. Public Health Service; statistics relating to the Armed Forces provided by the Department of Defense; and estimates of net interstate migration, developed in part from official records of school enrollment obtained from the U.S. Office of Education, State Departments of Education, Catholic school systems throughout the country, and The Official Catholic Directory, and in part from statistics provided by the Social Security Administration on the movement of aged beneficiaries covered by old age and survivors insurance. Data on school enrollment for selected States were also obtained from the Bureau of Indian Affairs and the Jewish Education Committee of New York, Inc.

The birth and death statistics used in preparing the estimates for States include final reports on births and deaths for 1960 through 1965, classified on a residence basis, and provisional reports on births and deaths for 1966 and 1967 classified on an occurrence basis. All provisional figures were adjusted to a residence basis. The data on births were corrected for underregistration using factors extrapolated from the results of the 1950 Birth Registration Test conducted by the National Office of Vital Statistics (part of the National Center for Health Statistics), U.S. Public Health Service, in conjunction with the 1950 Census of Population. It was assumed that the percent completeness of birth registration in hospitals and out of hospitals has remained unchanged since 1950. Registered births in hospitals and out of hospitals were corrected separately by those factors to allow for an expected improvement in registration due to the increased concentration of births in hospitals, where registration has been more complete. In 1965, the estimated completeness of birth registration for the Nation as a whole was 98.9 percent.⁵

ACCURACY OF ESTIMATES

The technique used to develop estimates by age has been employed by the Bureau of the Census for a number of years. The estimates are considered to be fairly accurate, but they are subject to substantially larger error on the average than are estimates for the total population of States.⁶

The estimates of population in ages 5 to 17 and 65 and over presented in this report are believed to have relatively higher accuracy than those of other

⁵White 99.3 percent; nonwhite 96.9 percent.

⁶A rough evaluation of the results of this method for selected age groups for the 1950 decade is presented in: Meyer Zitter and Henry S. Shryock, Jr., "Accuracy of Methods of Preparing Postcensal Population Estimates for States and Local Areas," Demography, Vol. 1, No. 1, 1964, table 7.

³U.S. Bureau of the Census, 1960 Census of Population, Vol. I, Characteristics of the Population, Part 1, United States Summary, pp. XVI-XVII, XXXVIII-XL.

⁴See, for example: Conrad Taeuber and Morris H. Hansen, "A Preliminary Evaluation of the 1960 Census of Population," Demography, Vol. I, June 1964. U.S. Bureau of the Census, Evaluation and Research Program of the U.S. Censuses of Population and Housing, 1960, Series ER-60, No. 2, "Record Check Studies of Population Coverage;" No. 4, "Accuracy of Data on Population Characteristics as Measured by Reinterviews;" and No. 5, "Accuracy of Data on Population Characteristics as Measured by CPS-Census Match." Jacob S. Siegel and Melvin Zelnik, "An Evaluation of Coverage in the 1960 Census of Population by Techniques of Demographic Analysis and by Composite Methods," Proceedings of the Social Statistics Section 1966 (American Statistical Association). Jacob S. Siegel, "Completeness of Coverage of the Nonwhite Population in the 1960 Census and Current Estimates, and Some Implications," paper to be published in the Proceedings of the Conference on Social Statistics and the City (ed. David M. Heer), June 22-23, 1967, Joint Center for Urban Studies of the Massachusetts Institute of Technology and Harvard University.

age groups. In both these instances, the estimates of migration are based on State data relating directly to the specific age group (school enrollment for the former and beneficiary data for the latter). Furthermore, for the population 65 years old and over, migration is low in most cases, and thus even large errors in this component have comparatively little effect on the final estimate of population at these ages. The assumptions made as to net interstate migration for the other age groups are so broad that small or even moderate changes by age over the estimating period may not be very accurate. Accuracy tests made for the 1950-60 decade, however, suggest that most of the estimates reflect the true level fairly well (see footnote 6).

A special caution is needed relative to the estimates for the District of Columbia. In general, it is believed that the age estimates presented in this report for this area are subject to substantially larger errors than those for the States. The relatively mechanical means employed for distributing migration estimates, by age, for States may be inappropriate for use in urban areas like the District of Columbia. Gross patterns of interstate migration, by age, used here are not likely to be consistent with patterns of migration exchange, by age, occurring between the central city of a metropolitan area (which the District of Columbia constitutes) and its suburbs. This may affect particularly the distribution of migrants between the District and its suburbs in the States of Maryland and Virginia for the population under 5 years of age. It was considered prudent to merge the estimates for the population in this age group for the District of Columbia with those for Maryland and Virginia. The tables in this report show only a single figure representing the three areas in combination for the age group under 5.

The age estimates for 1967 for all States are necessarily much less reliable than the comparable estimates for 1966, since they depend heavily on extrapolation of the components of change. The provisional nature of the net migration component is particularly significant, and subsequent revision of this component will have important impact on the estimates.

Comparison of published estimates of the population 65 years old and over with Medicare statistics.--As mentioned above, the estimates of the population 65 years old and over given here make use of the estimates of migration based on data on the movement of aged beneficiaries under the Old Age, Survivors, Disability, and Health Insurance program. The State given in the mailing address of beneficiaries is presumed to be the State of residence, and on this basis beneficiaries are tabulated by their State of residence at the beginning

and end of the fiscal years. The estimates of interstate migration of beneficiaries are used to estimate net interstate migration for all persons 65 years old and over.

New program statistics becoming available from the relatively recent "Medicare" program will provide a new source of current data relating to the population 65 years old and over.⁷ It is believed that, over the long run, the Medicare statistics should provide an improved basis for estimating the population 65 years old and over because of the very high rate of participation of the population in this age group in the program. With only minor exceptions (see below) all persons 65 years of age and over are automatically covered by the basic protection of the program against cost of hospital and post-hospital services. Thus, the number of persons enrolled under the basic provisions of the program should closely approximate the total aged population.

The Bureau of the Census is exploring the possibility of using these Medicare statistics as bases for estimates of the population 65 years old and over. A comparison was made between the published estimates of the population 65 years and over on July 1, 1966, and recently published statistics on the number of persons enrolled in the program residing in each State. In general, the differences between the two sets of data are quite small. For the United States as a whole, the Medicare figure for July 1, 1966, exceeds the independent estimate by just over 100,000, or about 0.6 percent. The differences State by State are also quite small; 21 States have differences of less than 1 percent and the overall average difference is 1.6 percent. The distribution of the differences is as follows:

<u>Percent of difference</u>	<u>Number of States</u>
Under 0.5 percent	15
0.5 to 0.9	6
1.0 to 1.9	10
2.0 to 2.9	11
3.0 to 4.9	6
5.0 percent and over	3

Some of the differences, particularly in those cases where the Medicare figure is less than the published estimate, may be accounted for by the difference in coverage in the two sets of estimates.

⁷Health Insurance Enrollment Under Social Security, July 1, 1966, Office of Research and Statistics, Social Security Administration, U.S. Department of Health, Education, and Welfare.

There are two types of categories excluded from the Medicare statistics which would lead to understatement in some of the States. Excluded from the Medicare program are persons not entitled to cash retirement benefits under Social Security who had an opportunity for protection under the Federal Employee Health Benefits Act of 1959. This exclusion would affect mainly Federal employees 65 years of age and over who had retired after the Health Benefits Act became effective. This would lead to some understatement in the population based on Medicare numbers, particularly for the District of Columbia (and surrounding counties); other States with large numbers of Federal civilian employees, such as New York and California, would also be affected.

Also excluded under the Medicare program are aliens with less than five years of consecutive residence in this country. Although this exclusion should have little general effect on the figures, Florida might be affected to the extent that significant numbers of the elderly were included among Cuban refugees to Florida after 1960. Another category excluded from the Medicare statistics, namely, those convicted of crimes against the security of the United States, is not expected to have any measurable impact on the data.

A review of the estimates from the two separate sources is continuing, with a view toward shifting the base of the estimates to the statistics from the

Medicare program as soon as practicable. When this shift occurs, the Medicare statistics will be adjusted to allow for those excluded categories mentioned above.

RELATED REPORTS

The estimates of the population of States by broad age groups contained in this report are consistent with the estimates of the total population of States published in Current Population Reports, Series P-25, No. 380.

The national totals by age for the years 1964 to 1967 agree with those shown in Series P-25, No. 385; the figures for 1961 to 1963 are consistent with national population estimates by age published in No. 321.

Revised projections of the population of States by age, 1970 to 1985, are given in Series P-25, No. 375.

ROUNDING OF ESTIMATES

Estimates presented in the tables of this report have been rounded to the nearest thousand without being adjusted to group totals, which are independently rounded. Percentages are based on unrounded numbers.

¹Based on the special census of Rhode Island taken as of October 1, 1965.

²These estimates do not reflect the results of the special census of Delaware taken as of September 20, 1967, which showed a total population of 524,000. Data by age from the special census are as follows: under 5 years, 52,000; 5 to 17 years, 143,000; 18 to 44 years, 190,000; 45 to 64 years, 100,000; and 65 years and over 41,000. Detailed results of the special census are published in Current Population Reports, Series P-23, No. 1463.

³Numbers for this age group are shown for the District of Columbia, Maryland, and Virginia combined. See "Accuracy of estimates" section of text.
