Estimates of the Population of the United States and Components of Change: 1970 to 1985

(The estimates for the 1980's shown in this report supersede those shown in Current Population Reports, Series P-25, No. 971. Estimates are consistent with both the revised 1970 resident population count of 203,302,031 and the 1980 tabulated resident population count of 226,545,805.)

INTRODUCTION

This report provides estimates of the population of the United States for each month from January 1, 1950, to January 1, 1986. It also shows estimates of the components of change for the total population by race for each calendar year and for each year ending June 30 from 1970 to 1985.

These estimates contain estimated emigration of 160,000 per year since 1980 and net undocumented immigration of 200,000 per year. Prior to this, the time series had no allowance for undocumented immigration and an allowance of only 36,000 for emigration. For further information on these changes, see the "Trends in net civilian immigration" and "Methods and sources of data" sections.

HIGHLIGHTS

- The total population including Armed Forces overseas increased by 0.9 percent from 238,222,000 on January 1, 1985, to 240,468,000 on January 1, 1986.
- There were 15.7 births per 1,000 population in 1985, up from 15.6 in 1984 and 15.5 in 1983, but slightly below the birth rates of the early 1980's and far below the highest postwar birth rate of 26.5 in 1947. The 3.7 million births in 1985 were the most since 1965 but still considerably below the 4.3 million in 1957.
- There were 8.7 deaths per 1,000 population in 1985. The death rate has fluctuated in the 8.5 to 8.7 range since 1977 after declining from 9.4 in 1972. The number of deaths recorded in 1985 (2.1 million) was the largest in the Nation's history. Deaths have increased each year since 1982 and for the third year in a row exceeded 2 million. The increases are due to the larger size and continued aging of the population.
- There were 2.4 net immigrants per 1,000 population in 1985, down from 2.6 in 1984 and 3.7 in 1980, which was the highest rate of net civilian immigration since the Great Depression.

- The Black population grew by 1.5 percent in 1985, more than twice as rapidly as the White population (0.7 percent). Rates of growth for both these groups have declined dramatically since 1960, Blacks by one-third (from 2.2 percent) and Whites by more than half (from 1.5 percent).
- The other-races population grew far more rapidly than Whites or Blacks (5 percent in 1985), mainly because of the high level of Asian immigration.

TRENDS IN POPULATION GROWTH

On January 1, 1986, the total population including Armed Forces overseas was estimated to be 240,468,000, an increase of 2,246,000 over the population on January 1, 1985 (table 1). This was a slightly smaller increase than the 2,262,000 increase in 1984. The amount of growth during 1985 was the result of a natural increase of 1,667,000 and net civilian immigration of 577,000. During 1984, the amount of natural increase was 1,645,000 and net civilian immigration was 615,000. Thus, while natural increase rose slightly in 1985, net civilian immigration fell.

The average annual rate of growth between April 1, 1980 and January 1, 1986, was 10.0 per 1,000 population (table A). This was a little lower than the 10.5 per 1,000 average annual growth rate experienced during the 1970's.¹ The Black-and-other-races population continued to grow at a faster rate than the White population because of the higher fertility level of both Blacks and other races and the high volume of immigration of other races.² During 1985, the growth rate was 7.2 per 1,000 for Whites, 21.5 for Blacks and other races combined, and 14.6 for Blacks alone (table 2).

TRENDS IN FERTILITY

There were 3,750,000 births in 1985, compared with 3,690,000 births in 1984, and 3,639,000 births in 1983. For the last 10 years, there has been a strong upsurge in the number of births occurring in the United States. This followed a 15-year period of decline in births between 1960 and 1975. The 1985 level is far below the 4,332,000 births occurring in 1957, the peak year of the baby boom. This increase in the number of births since 1975 reflects larger numbers of women in the childbearing ages rather than an increase in fertility rates (table B).

¹It should be noted that the large error of closure for the 1970-80 period (4.6 million persons) contributed significantly to the 10.5 per 1,000 average annual growth rate for the 1970's. See the "Methods and sources of data" section for the definition of error of closure.

²"Other races" is a category consisting principally of American Indians, Alaskan Natives, Asians, and Pacific Islanders.

¹Estimates of deaths differ according to type of population as a result of inclusion or exclusion of deaths of Armed Forces at home and overseas.²See text for definition of error of closure.³Census counts: April 1, 1980—226,545,805; April 1, 1970—203,302,031.

The three basic period measures of fertility all rose slightly for the second straight year. The crude birth rate (births per 1,000 population) was 15.7 in 1985, 1 percent higher than in 1984 (15.6), but 14 percent lower than in 1970 (18.2), and 38 percent lower than in 1957 (25.2). The general fertility rate (births per 1,000 women 15 to 44 years old) registered a small increase in 1985 to 66.1 from the 1984 figure of 66.0. The 1985 rate was still 25 percent below the 1970 rate of 87.9 and 46 percent below the 1957 rate of 122.7. The total fertility rate (annual births expressed in terms of the *implied* completed fertility of 1,000 women) was about 1,837 in 1985, an increase of 1 percent from the 1984 level of 1,814.³ This

was less than half of the 1957 rate of 3,760. Between 1970 and 1985, the total fertility rate dropped by 26 percent.

Although the total fertility rate has been below 2,100 (the level at which persons in their childbearing years are just replacing themselves) for 13 years, natural increase (births minus deaths) is still more than 1 million persons per year. Because of variations in age structure, replacement level fertility does not necessarily mean zero growth. Currently, in the United States, for example, a relatively large proportion of women are in the childbearing ages because of the baby boom extending from 1946 to the early 1960's. In the absence of immigration from abroad, prolonged fertility at replacement level would eventually stabilize the proportion of women of childbearing age, and the annual number of births would equal the number of deaths. However, even with the assumption of ultimate completed cohort fertility of 1.9 births per woman (well below the replacement level), it would take about 40 years for the population to stop growing. (See Current Population Reports, Series P-25, No. 952, table 10, projection series 29 for projections of the population assuming no net immigration.)

³More specifically, the total fertility rate is the number of births that 1,000 women would have in their lifetime if, at each year of age, they experienced the birth rates occurring in the specified calendar year. It should be stressed that the total fertility rate is an annual (or period) measure of fertility, even though it is expressed as a hypothetical lifetime (or cohort) measure. The total fertility rate is affected by the timing as well as the level of childbearing. The following example illustrates this point. The total fertility rate peaked in 1957 at 3,760. However, it now appears that the highest cohort fertility rate among women who were then in the childbearing ages will be about 3,200 for women born in the early 1930's.

Table B. Annual Measures of Fertility: 1930 to 1985¹

Calendar year	Crude birth rate ¹	General fertility rate ²	Total fertility rate ²	Calendar year	Crude birth rate ¹	General fertility rate ²	Total fertility rate ²
1985	15.7	66.1	³ 1,837	1954	25.2	117.9	3,537

1955	24.9	118.3	3,574				

¹Including Alaska, Hawaii, and Armed Forces overseas. Births corrected for underregistration through March 1970.

²Resident population including Alaska since 1959 and Hawaii since 1960. Births corrected for underregistration through 1959. For 1930 to 1985: National Center for Health Statistics, *Vital Statistics of the United States, 1980*, Vol. 1, Natality, DHHS Pub. No. (PHS) 85-1100. Public Health Service, Hyattsville, Md., 1984, tables 1-1 and 1-6; "Advance Report of Final Natality Statistics, 1983." *Monthly Vital Statistics Report*, Vol. 34, No. 6 Supplement DHHS Pub. No. (PHS) 85-1120. Public Health Service, Hyattsville, Md., 1985, tables 1 and 4; "Births, Marriages, Divorces, and Deaths for 1985." *Monthly Vital Statistics Report*, Vol. 34, No. 12, DHHS Pub. No. (PHS) 86-1120. Public Health Service, Hyattsville, Md., 1985, p. 1; and unpublished data.

³Estimated total fertility rates for 1984 and 1985 are based on indirect standardization and 1983 final age-specific birth rates.

⁴Total fertility rates for 1930-39 based on births adjusted for underregistration from National Center for Health Statistics (unpublished data consistent with birth rates published in National Center for Health Statistics, *Fertility Tables for Birth Cohorts by Color: United States, 1917-73*, April 1976) and female resident population from Current Population Reports, Series P-25, No. 311.

The *crude birth rate* can be misleading as an indicator of trends in fertility because it is affected by the age-sex structure of the population. The *general fertility rate* is a more satisfactory indicator because its denominator is restricted to women in the childbearing ages. However, it is affected by age structure within the 15-to-44 age span. As a result, the *total fertility rate*, which is the sum of female age-specific birth rates and thus is not affected by age structure, is the most satisfactory of the three rates as an indicator of fertility trends.

TRENDS IN MORTALITY

There were 2,083,000 deaths in 1985 including deaths of Armed Forces personnel overseas. This was up from 2,046,000 deaths during 1984. The crude death rate was 8.7 per 1,000, also up slightly from its 1984 level of 8.6 (table

1). Deaths surpassed 2 million (2,020,000) for the first time in 1983. The recent increase in the total number of deaths was due to both the growth in the size of the U.S. population and its continued aging, and not to the deterioration of mortality conditions which have improved over time. Between 1970 and 1985, the crude death rate declined by over 7 percent, from 9.4 per 1,000 to 8.7 per 1,000.

Another measure of mortality conditions is life expectancy at birth. In 1984, the latest year for which data are available, the expectation of life at birth was 74.7 years for the resident population.⁴ This matched the record high set in 1983. For males the expectation of life at birth was 71.0 years and

⁴National Center for Health Statistics, "Annual Summary of Births, Deaths, Marriages, and Divorces: United States, 1984." *Monthly Vital Statistics Report*, Vol. 33, No. 13, DHHS Pub. No. (PHS) 85-1120. Public Health Service, Hyattsville, Md., 1985.

Annual Levels of Net Growth, Births, Deaths, and Net Immigration: 1930 to 1985

for females it was 78.3 years. The expectation of life at birth in 1984 was 75.3 years for Whites, 71.3 years for Blacks and other races combined, and 69.7 years for Blacks alone. The trend toward longer life expectancy at birth remains the same for all races.

In 1984, the two leading causes of death were heart disease (37.4 percent) and cancer (22.1 percent), together accounting for almost 60 percent of all resident deaths. Other leading causes were cerebrovascular diseases or strokes (7.6 percent) and accidents (4.6 percent). These four causes of death all had similar importance in 1973, when heart disease accounted for 38.4 percent of all deaths, cancer for 17.8 percent, cerebrovascular diseases for 10.9 percent, and accidents for 5.9 percent.⁵

TRENDS IN NET CIVILIAN IMMIGRATION

During 1985, net civilian immigration to the United States was estimated to be 577,000 or 2.4 per 1,000 population. This was a slight decrease from 1984, when net civilian immigration was 615,000, or 2.6 per 1,000 population, and far less than in 1980, probably the peak year for immigration since World War I. Net civilian immigration was especially high in

1980 (845,000 or 3.7 per 1,000) because of the large number of Cuban and Haitian entrants who came into the United States during that year.

Almost 26 percent of the population change in 1985 was due to immigration as compared with approximately 33 percent in 1980. In 1970, only 17 percent of the net change was accounted for by net civilian immigration.

By far the largest component of net civilian immigration is alien immigration. The Immigration Act of 1965 has resulted in a shift in the geographical origin and the racial composition of alien immigrants to the United States. In the past, immigrants have been predominantly White and European. Gradually, however, the proportion of immigrants from Europe has declined from 41.8 percent of all alien immigrants in the year ending June 30, 1964, to 31.1 percent in the year ending June 30, 1970, to just 10.5 percent in the year ending September 30, 1983 (the latest year for which data are available).⁶ Immigrants from Asia increased from 7.5 percent of the total in 1964, to 25.4 percent in 1970, and to 49.6 percent in 1983. As a result, the proportion of immigrants of races other than White or Black has grown substantially.

⁵National Center for Health Statistics, *Vital Statistics of the United States, 1973*, Vol. II, Mortality, Part A, (HRA) 77-1101. Public Health Service, Rockville, Md., 1977.

⁶These data include refugees in the year in which they adjusted to permanent resident alien status rather than in the year which they actually entered the United States. This is the Immigration and Naturalization Service's standard procedure. In all of the tables in this report, refugees are counted in the year in which they actually entered the United States. The sources of the data are from the Immigration and Naturalization Service, *1983 Statistical Yearbook* and *1973 Annual Report*.

Because of this high level of Asian immigration, the other-races population has grown far more rapidly than Whites or Blacks. For 1985, the other-races rate of growth was 5.0 percent, compared with 0.7 percent for Whites and 1.5 percent for Blacks. More than half of the other-races growth is attributable to immigration (table C) as compared with 20 percent or less for Whites and less than 15 percent for Blacks.

Two modifications have been made to the methodology used to derive net civilian immigration for April 1, 1980, to the present since this report was last published. First, net civilian immigration now contains an allowance of 200,000 per year for undocumented immigration. Second, estimated legal emigration has been increased to 160,000 annually from the 36,000 figure used previously. Together, these two changes increase net civilian immigration by 76,000 per year. This should be kept in mind when comparisons are made with net civilian immigration data for the period prior to April 1, 1980, because estimates for the earlier period do not contain these modifications.

COVERAGE OF POPULATION

Estimates of the total population including Armed Forces overseas, the resident population, and the civilian population are presented for each year from 1950 to 1986. The *resident population* conforms to the concept of the United States population as shown in the decennial census reports. In general, it includes residents of the 50 States and the District of Columbia but excludes residents of the Commonwealth of Puerto Rico, residents of the outlying areas under United States sovereignty or jurisdiction (principally American Samoa, Guam, Virgin Islands of the United States, Northern Mariana Islands, and the Trust Territory of the Pacific Islands excluding

the Northern Mariana Islands), and other American citizens (military and civilian) living overseas. The *total population including Armed Forces overseas* includes the resident population of the United States plus the Armed Forces stationed in foreign countries, Puerto Rico, and the outlying areas, but excludes dependents of the Armed Forces overseas. The *civilian population* represents the resident population less the Armed Forces stationed in the United States.

METHODS AND SOURCES OF DATA

The population estimates involved the following computational steps:

- (1) Last census count of resident population,
- + (2) Armed Forces overseas on the census date,
- + (3) resident births,
- (4) deaths, including deaths to Armed Forces overseas,
- + (5) net civilian immigration,
- + (6) net inductions into Armed Forces overseas,
- ± (7) error of closure for the pre-1980 intercensal periods,
- (8) Armed Forces overseas on the estimate date, to obtain the resident population,
- (9) Armed Forces in the United States on the estimate date, to obtain the civilian population.

The Armed Forces components are based on data on the size and distribution of the Armed Forces obtained from the Department of Defense and from the Army, Navy, Air Force, Marine Corps, and Coast Guard (Department of Transportation). Reserve forces on 3 and 6 months active duty for training, National Guard reserve forces on active duty for 4

Table C. Components of Population Change for Selected Periods, by Race: 1970 to 1985

(Numbers in thousands)

Period	Mid-period population	Change during period (January 1 to December 31)			Average annual percent change	Immigration as a percent of net change

Source: Tables 2 and 3.

months or more, and students at the military academies are included in the Armed Forces; reserve forces and national guardsmen on shorter tours of training and officers in the Public Health Service are not included. Crews of U.S. Naval vessels homeported in the United States and not deployed to the overseas fleets are included in the United States resident population; those deployed to the overseas fleets and those homeported outside the United States are considered overseas.

Estimates of the Armed Forces based on the Department of Defense and Department of Transportation data are used throughout for census dates, although counts of the Armed Forces are obtained in the decennial censuses.

Births and deaths for the resident population are tabulated by the National Center for Health Statistics (NCHS), Department of Health and Human Services. Final tabulations for births and deaths were used through 1983. Provisional data were provided by NCHS for all subsequent years. The provisional estimates of births for races other than White were distributed to Black and to other races using final 1983 data. The 10-percent sample of death certificates from NCHS was used to distribute provisional estimates of resident deaths by race. Data provided by the Department of Defense and the Coast Guard have been used to estimate deaths of military personnel.

In this report, the number of births was corrected for under-registration through March 1970. The correction was dropped after April 1, 1970, because it was estimated that the registration of births was over 99 percent complete. Estimates of net civilian immigration are final through June 1984. Subsequent data are either partly or wholly provisional. The figures were derived by combining estimates for six separate categories⁷: (1) alien immigration, (2) emigration, (3) net undocumented immigration, (4) net arrivals of civilian citizens, (5) net arrivals from Puerto Rico, and (6) refugees.

Estimates of the number of alien immigrants entering the United States are derived from statistics provided by the Immigration and Naturalization Service, Department of Justice. Estimates of the race of alien immigrants to March 1970 are based on the reported country of birth of alien immigrants and on the race of the foreign-born population enumerated in the 1960 census. Information on the race, sex, and country of origin of the foreign-born population who entered the United States in the 1965-70 period is available from a special tabulation of 1970 census data. These census figures have been used to estimate the race of alien immigrants for April 1970 to June 1979. The race of alien immigrants for July 1979 to the present has been estimated based on a special 1980 cen-

sus tabulation of the foreign born who entered the United States during the 1975-80 period.

Aliens who entered the United States on a conditional basis and later adjusted to permanent resident status were added to the population estimates in the year of entry rather than the year that they appeared in official immigration statistics.

No direct information about emigration of United States citizens or resident aliens is available for the period covered by this report. The Immigration and Naturalization Service stopped collecting data on alien emigration in 1957, and permanent departures of citizens are not recorded. The annual level of emigration for the 1970's is estimated to be 36,000, based on data on permanent arrivals from the United States published during the 1960's by various foreign countries and data provided by the Social Security Administration showing the migration of beneficiaries between the United States and foreign countries. Studies have indicated that the actual level of emigration has become much higher, however. As a result of these studies, for the period from April 1980 through the present, emigration is estimated to be 160,000 per year.⁸ The estimated level of emigration was not changed for the 1970's because, without the concomitant addition of undocumented aliens for that decade, the error of closure (see below) would have been even larger.

Estimates of net undocumented immigration to the United States have been incorporated into the population estimates for all years since April 1980. Analysis of 1980 census data in conjunction with Immigration and Naturalization Service data on legal immigration and registered aliens indicates that about 2.1 million undocumented aliens residing in the United States were counted in the 1980 census.⁹ Of the 2.1 million undocumented aliens counted, about 940,000 entered the United States during the 1975-80 period. A supplement to the April 1983 Current Population Survey was used to update the census estimates of undocumented immigration. Although subject to some limitations, this study found an annual net increase of 100,000 to 300,000 in the undocumented alien population for 1980 to 1983. On the basis of these two studies, an estimate of 200,000 net undocumented immigrants for each year since 1980 has been used for the population estimates shown in this report. The race distribution is based on the distribution by country of the same undocumented immigrants in the 1980 census and census data on the racial distribution of the foreign-born population by country.

The category of net arrivals of civilian citizens was estimated on the basis of the change in the number of civilian Federal employees overseas as reported by the Department of Defense and the Office of Personnel Management. A change in the size of the overseas population, minus its births, was assumed to indicate net movement to or from the United

⁷These statistics include certain extraneous categories which tend to cancel out as follows:

- a. Immigrants from foreign countries to Puerto Rico and to other outlying areas are counted with the immigrants to the United States in category 1.
- b. Immigrants from other outlying areas and foreign countries to Puerto Rico are counted with the emigrants from the United States in category 5.
- c. Emigrants from Puerto Rico to other outlying areas and foreign countries are counted with the immigrants to the United States in category 5.

⁹See Robert Warren and Jeffrey S. Passel, "A Count of the Uncountable: Estimates of Undocumented Aliens Counted in the 1980 United States Census," submitted for publication, Appendix II.

States.¹⁰ The net movement of civilian citizens overseas not affiliated with the Federal Government was not taken into account. Data from the Office of Personnel Management were used to distribute the estimates by race.

Estimates of the net movement of persons between Puerto Rico and the United States mainland were based on the movement of passengers as reported by the Puerto Rico Planning Board. The figures for net arrivals were smoothed by use of a centered 12-month moving average. This procedure serves to eliminate variations arising from the seasonal movement of travelers.

Data on refugees and entrants who have entered the United States were provided by the Office of Refugee Resettlement, Department of Health and Human Services.

Inductions less discharges overseas (a minor component of population change shown separately in table A) represent the difference between the number of persons inducted into the Armed Forces at overseas locations and the number of servicemen discharged from the Armed Forces overseas. Inductions less discharges overseas for each month were estimated as the net change during the month in the number of recruits from overseas who are in the Armed Forces.

The last of the components of change listed in table A is the error of closure. This is the difference between (1) the population as shown by a census count and (2) the estimate of the population on that date as derived from the previous census count and data on the various components of population change for the intercensal period. For the 1970-80 period, the estimate of the error of closure is 4,590,000. Since this difference represents the balance of errors in the estimates of the components of change and in the two census counts, the size of the error of closure should not be taken as a measure of the accuracy of either the estimates of the individual components of change or the census counts. The extremely large error of closure in the 1970's (compared with about 300,000 in the 1960's and 3,000 in the 1950's) has been attributed to (1) improvements in census coverage, (2) failure of the post-1970 estimate to allow for the 2.1 million undocumented aliens counted in 1980, and (3) duplicate counting in the 1980 census. In preparing the intercensal estimates shown in this report, the error of closure was distributed over the 10-year intercensal period in order to obtain a smooth transition between the 1970 and 1980 census counts.

The components of change from 1970 to 1980 and from 1980 to 1986 in table A are given according to three definitions—total population including Armed Forces overseas, resident population, and civilian population. These three sets of figures differ only in the treatment of the Armed Forces component. Components of change for the total population

including Armed Forces overseas take into account deaths to all members of the Armed Forces, as well as inductions and discharges overseas; those for the resident population take into account deaths to resident Armed Forces and treat the movement of Armed Forces to and from posts overseas as an additional category of migrants; those for the civilian population omit military deaths but take into account inductions and discharges in the United States.

Because of differences in the reporting of race between the 1980 census and sources of administrative data (such as births and deaths), the 1980 census counts were modified to be consistent with the Office of Management and Budget categories. The modification resulted in the addition of 6.3 million persons to the White category and 188,000 persons to the Black population. All persons added to these two groups had reported themselves to be of other races; the majority of them identified themselves as being of Spanish origin.¹¹

Symbols. In this report, a dash “—” means zero or rounds to zero, “X” means not applicable, and “NA” means not available. A minus sign preceding a figure denotes decrease.

Rounding. The estimates shown in this report have been independently rounded to the nearest thousand from figures computed to the last digit; hence, the sums of parts shown may differ from the totals shown. Percents, rates, and averages are based on unrounded numbers.

RELATED REPORTS

The table shown below lists other Current Population Reports containing estimates related to those shown in this report and specifies the years for which consistent data are provided.

Type of population estimate	Years covered	Series P-25 number
United States—		
By age, sex, and race	1980 to 1985	985
By age, sex, and race	1970 to 1979	917
By age, sex, and race	1960 to 1969	519
By age, sex, and race	1900 to 1959	311
Total, monthly, by type of population	1970 to 1986	989
Total and components of change by race	1940 to 1969	802
Total and components of change by age, sex, and color	1950 to 1960	310

¹⁰For the purposes of this estimation procedure, the few deaths to the American population overseas, the balance of U.S. citizens who leave Federal employment but remain overseas, and U.S. citizens living overseas who accept Federal employment was ignored.

¹¹This modification procedure is described in more detail in Jeffrey S. Passel, “Procedures for Producing Preliminary OMB-Consistent Modified Race Data from the 1980 Census by Age, Sex, and Hispanic Origin for States and Counties,” Bureau of the Census, unpublished.
