INTRODUCTION
This report presents data on property value at the national level and for metropolitan statistical areas (metro areas) based on the 2008 and 2009 American Community Surveys (ACS). The value of property is an important component in measuring neighborhood quality, housing affordability, and wealth. These data provide socioeconomic information not captured by household income and comparative information about metro housing markets.

The change in property values provides insight into the many countervailing pressures evident in metro housing markets throughout the nation. Record number of foreclosures, high levels of unemployment, and borrowers owing more on their mortgages than their homes are worth continued to depress housing markets while federal initiatives such as the first-time homebuyer tax credit and low mortgage interest rates attempted to provide some much needed stability. The maps and table that accompany this report identify median property values in 2009 and percentage changes of property values between 2008 and 2009 for metro areas.

In the ACS, value is the owner’s estimate of how much the property (house and lot, mobile home and lot, or condominium unit) would sell for if it were for sale.

Median value means that one-half of all homes were worth more and one-half were worth less. Median value estimates for 2008 were inflation-adjusted to 2009 dollars.

PROPERTY VALUE
In 2009, the median property value for owner-occupied homes in the United States was $185,200. Of all 366 metro areas, the median property values ranged from $76,100 in McAllen-Edinburg-Mission, TX, to $638,300 in San Jose-Sunnyvale-Santa Clara, CA. Median property values were significantly below the national median in 247 metro areas while 107 had median property values significantly higher than the national median. Twelve metro areas were not significantly different from the national median.

Among the 50 most populous metro areas, 20 metro areas had lower median property values and 29 had higher median property values than the national median. One metro area (Jacksonville, FL) was not significantly different from the national median.

Five of the ten highest median property values among the fifty most populous metro areas were located in California: San Jose-Sunnyvale-Santa Clara ($638,300), San Francisco-Oakland-Fremont ($591,600), Los Angeles-Long Beach-Santa Ana ($463,600), San Diego-Carlsbad-San Marcos ($417,700), and Sacramento–Arden-Arcade–Roseville ($298,000). The remaining five Metro Areas with the highest median property values

1 For more information on metro areas, please see <www.whitehouse.gov/omb/assets/omb/bulletins/fy2009/09-01.pdf>.
2 For a more in-depth discussion of this and related issues see Joint Center for Housing Studies of Harvard University, State of the Nation’s Housing 2010, <www.jchs.harvard.edu/son/index.htm>.
3 For more information on property value, please see <www.census.gov/acs/www/UseData/Def.htm>.
values were New York-Northern New Jersey-Long Island, NY-NJ-PA ($439,500); Washington-Arlington-Alexandria, DC-VA-MD-WV ($387,900); Boston-Cambridge-Quincy, MA-NH ($369,200); Seattle-Tacoma-Bellevue, WA ($355,400); and Baltimore-Towson, MD ($299,200).4

The lowest median property value of the 50 most populous metro areas was Buffalo-Niagara Falls, NY ($116,000). Pittsburgh, PA, had the second lowest median property value at $120,600. Oklahoma City, OK ($123,400) and San Antonio, TX ($125,800) followed, though they were not significantly different from one another. Rounding out the bottom five with a median property value of $135,800 was Memphis, TN-MS-AR.

CHANGE IN PROPERTY VALUE

Between 2008 and 2009, median property value decreased in the United States by 5.8 percent. The percentage change in the 366 metro areas ranged from a decline of 34.0 percent in Merced, CA, to an increase of 19.7 percent in Hattiesburg, MS. One hundred thirty-three metro areas experienced a decrease in median property value. Of these 133 metro areas, 54 had a percentage decrease that was lower than the national percentage decline of −5.8 percent. Only 13 of the metro areas experienced an increase in median property value between 2008 and 2009.

Among the 50 most populous metro areas, none experienced a significant percentage increase in median property value. However, 15 had a percentage decrease in median property value significantly lower than the national percentage decline of −5.8 percent.

Of the 50 most populous metro areas with a percentage change in median property value of −9 percent or lower, 6 metro areas were located in California and 4 metro areas were located in Florida. Riverside-San Bernardino-Ontario, CA (−25.8 percent) and Las Vegas-Paradise, NV (−25.7 percent) had the largest percentage decreases in median property value between 2008 and 2009, though they were not significantly different from one another.

WHAT IS THE AMERICAN COMMUNITY SURVEY?

The American Community Survey (ACS) is a nationwide survey designed to provide communities with reliable and timely demographic, social, economic, and housing data for the nation, states, congressional districts, counties, places, and other localities every year. It has an annual sample size of about 3 million addresses across the United States and Puerto Rico and includes both housing units and group quarters (e.g., nursing facilities and prisons). The ACS is conducted in every county throughout the nation, and every municipio in Puerto Rico, where it is called the Puerto Rico Community Survey. Beginning in 2006, ACS data for 2005 were released for geographic areas with populations of 65,000 and greater. For information on the ACS sample design and other topics, visit <www.census.gov/acs/www>.

SOURCE AND ACCURACY

Data presented in this report are based on people and households that responded to the ACS in 2008 and 2009. The resulting estimates are representative of the entire population. All comparisons presented in this report have taken sampling error into account and are significant at the 90 percent confidence level unless otherwise noted. Due to rounding, some details may not sum to totals. For information on sampling and estimation methods, confidentiality protection, and sampling and nonsampling errors, please see the “2009 ACS Accuracy of the Data” document located at <www.census.gov/acs/www/Downloads/data_documentation/Accuracy/ACS_Accuracy_of_Data_2009.pdf>.

4 The median property values of Sacramento–Arden-Arcade–Roseville, CA Metro Area and Baltimore-Towson, MD Metro Area are not significantly different from one another.
Figure 1.
Median Property Value by Metropolitan Statistical Area: 2009

Median property value in dollars:
- 300,000 or more
- 200,000 to 299,999
- 150,000 to 199,999
- 100,000 to 149,999
- Less than 100,000

U.S. median property value = 185,200

*Statistically different at the 90 percent confidence level.*

**Notes:**
- Fifty most populous metropolitan statistical areas based on population estimates as of July 1, 2009. Metropolitan statistical areas defined by the Office of Management and Budget as of November 2008.
- Data are based on a sample and are subject to sampling variability. A margin of error is a measure of an estimate's variability. The larger the margin of error in relation to the size of the estimate, the less reliable the estimate. When added to and subtracted from the estimate, the margin of error forms the 90 percent confidence interval.
