

CHAPTER IV. AGE DISTRIBUTION.

INTRODUCTION.

At every census some attempt has been made to distribute the population by age, but at the early censuses the age grouping was not elaborate. In the census of 1790 the only age distribution was that of free white males, those 16 years of age and over being distinguished from those under 16. In 1800 and 1810 the free white males and females were distributed in five age groups. In 1820 the free white males were distributed in six age groups, the free white females in five groups, and the slaves and free colored in four groups. In 1830 and 1840 the free whites were distributed by age groups of 5 or 10 years, the slaves and free colored into six broader age groups. In 1850 and 1860 the whites, slaves, and free colored were distributed according to sex by 5-year groups up to and including 19 years and by 10-year groups from 20 to 100 years; under 1 year was also distinguished. In 1860 the Chinese and civilized Indians were distributed in the same way. In 1870 the native born, foreign born, native whites, colored, foreign-born whites, Chinese, and civilized Indians were distributed by single years to and including 4 years of age and thereafter by 5-year age periods; 18 to 19, 20, and 21 to 24 years were also distinguished. In 1880 and in each subsequent census the total population classified by nativity and color has been tabulated according to single years of age, and beginning with 1890 the native whites classified according to parentage have been similarly tabulated by single years.

For various uses to which census material is put statistics with regard to age are of great importance. The incidence of mortality can be so determined as to be of value only when the population can be distributed according to sex and age. Satisfactory birth rates and marriage rates can be computed only when statistics with regard to sex, age, and marital condition are available. The voting and military strength of the population depends on factors of sex and age. The differences in the age distribution of native and foreign born are important in their bearing on the economic, social, and political effects of immigration. Statistics of school attendance and illiteracy have value only when age is taken into account. In fact there are very few questions in vital statistics or sociology which can be studied with intelligence until

the age distribution of the population has been determined.

The statistics of age distribution for the United States proper are given in detail in the pages which follow. The data for Alaska, Hawaii, and Porto Rico are presented in detail in the sections on those territories in Vol. III of the Thirteenth Census Reports.

The age diagram.—The returns of the Thirteenth Census showing the distribution of the population by single years of age are given in Table 29, pages 310 to 313.

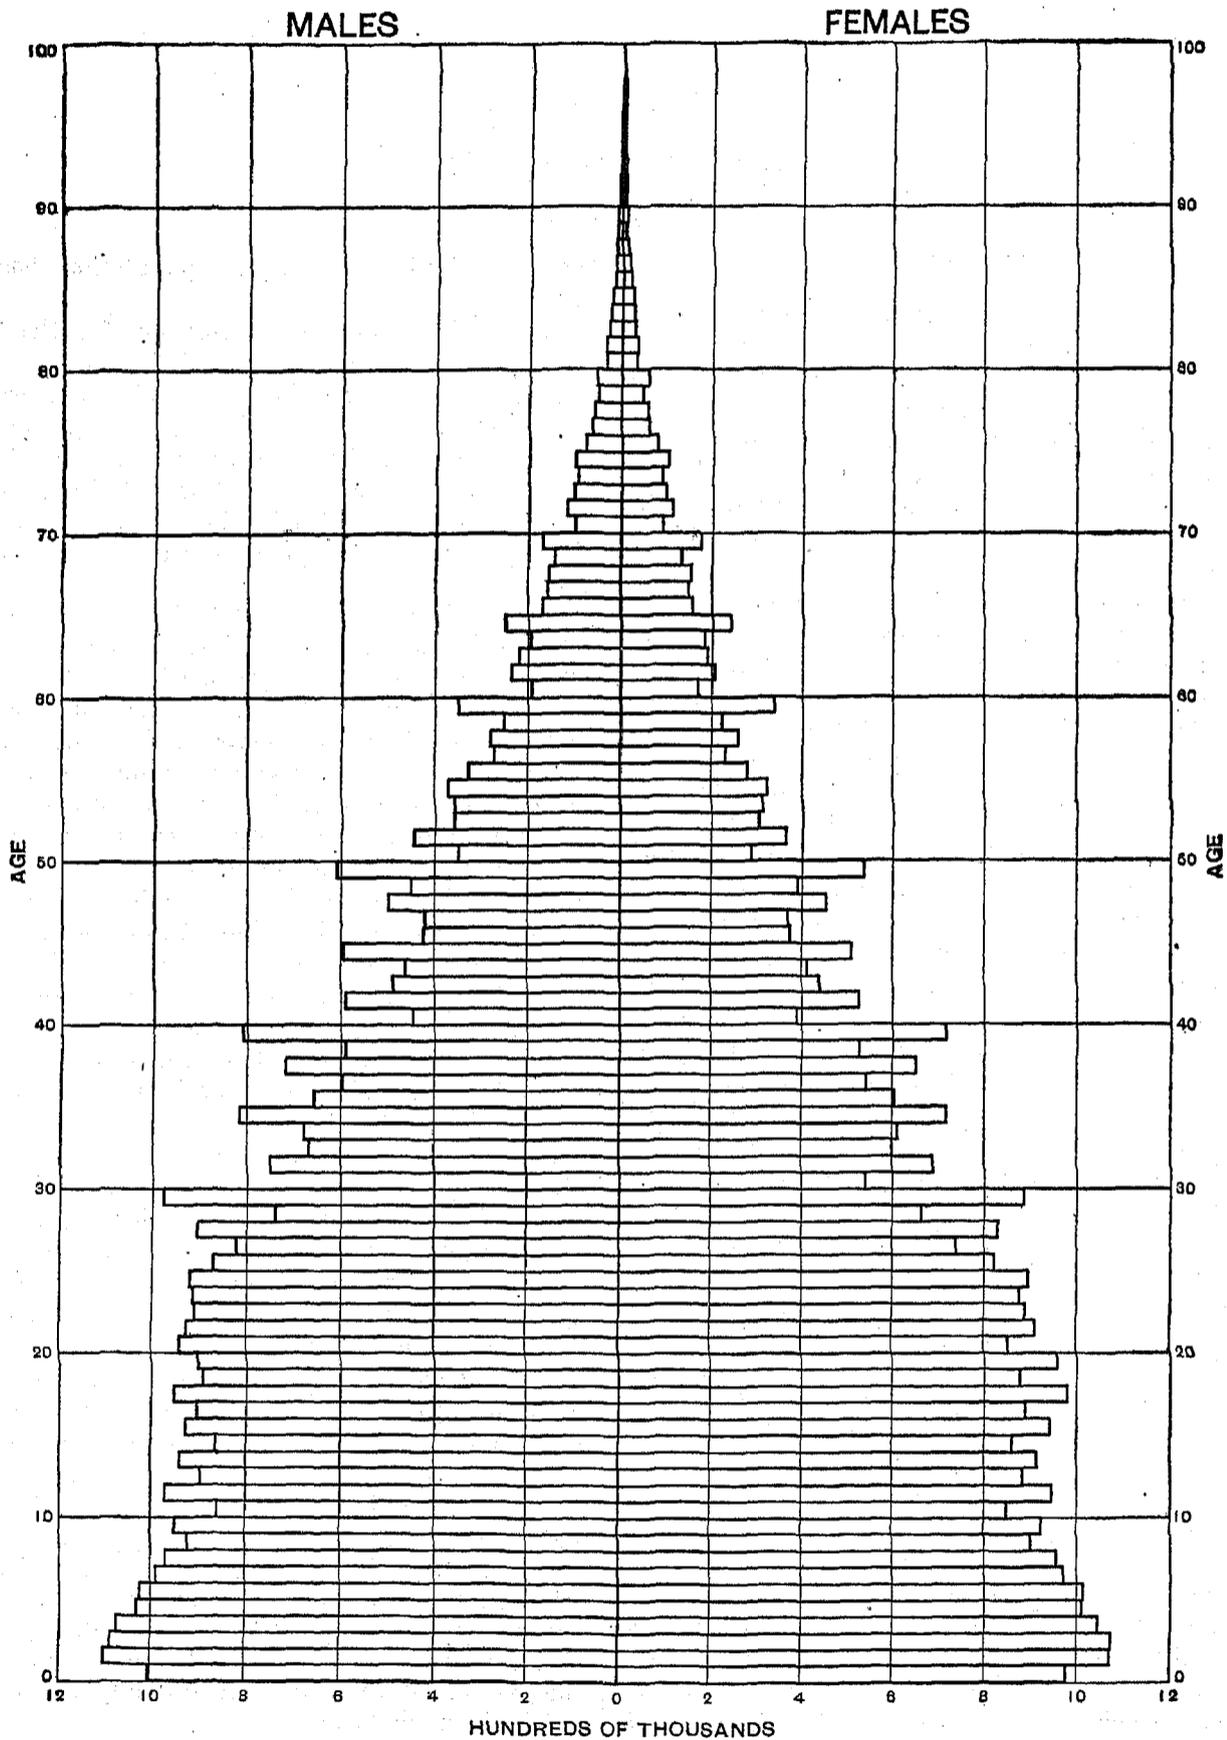

In the diagram on page 290 is shown the age and sex distribution in 1910 of the population of the United States by single years of age. The vertical line through the center divides the population into males and females, and the rectangles upon either side of this vertical line represent the number of males and of females, respectively, in each year of age.

If a country were entirely removed from communication with the rest of the world the age distribution of the population would be determined by births and deaths. Since death is continually depleting the population, the number of survivors at any given age is normally less than the number at any younger age, and therefore the rectangles constituting the age pyramid normally decrease in length from the base to the apex of the pyramid. Irregularities might, of course, be occasioned by any decided diminution in the number of births for any year or by an excessive rate of mortality among those born in some particular year or group of years. The irregularities apparent in the age pyramid for the United States are, however, obviously not to any considerable extent occasioned by irregularities in the birth rate or by any peculiar incidence of mortality.

Where a country is receiving or losing a large number of migrants every year the shape of the age pyramid is affected. Since a large proportion of migrants are in the more active years of life, a country which is losing considerable numbers by emigration would show a narrower pyramid after the years of childhood, and a country, like the United States, which is receiving a large number of immigrants, would show a broader pyramid above the years of childhood. Migration, however, would affect only the general shape of the pyramid and would not lead to any decided irregularities in single years.

POPULATION.

DISTRIBUTION BY AGE AND SEX OF THE TOTAL POPULATION: 1910.

Errors in age returns.—The diagram of the actual age returns for 1910 shows certain haphazard irregularities up to about the twenty-fifth year. After this age the rectangles representing the years ending in 5 and 0 project very considerably. These irregularities must be attributed to errors in the returns.

Error in the returns relating to age arises in part from the fact that a considerable number of persons do not know their exact age; in part from the fact that enumerators, in a considerable number of cases, obtain information relating to the person enumerated from a third person, either some member of the family found at home or the proprietor of a hotel or boarding house, who can give the age only approximately; and in part from the fact that in certain instances, apparently more frequent among women than among men, the age is intentionally misstated. Where the age is not accurately known there is a tendency to report it in round numbers, ending in 0 or in 5.

Many attempts have been made to reduce these errors, particularly those due to ignorance. In 1900 both "date of birth" and "age at last birthday" were called for, one as a check upon the accuracy of the other, and this double return may have reduced somewhat the margin of error. Where the answers to the two inquiries did not agree it was usually assumed that the year of birth was the more reliable, and the age given was changed accordingly. The possible gain in accuracy from this double return did not seem, however, to justify loading the population schedule—already complicated—with an additional inquiry. It was, therefore, determined to ask but one question with regard to age in 1910, and "age at last birthday" was the return indicated on the schedule. In 1910 the "Instructions to Enumerators" contained the following paragraphs:

110. *Column 7. Age at last birthday.*—This question calls for the age in completed years at last birthday. Remember, however, that the age question, like all other questions on the schedule, relates to April 15, 1910. Thus a person whose exact age on April 15, the census day, is 17 years, 11 months, and 25 days should be returned simply as 17, because that is his age at last birthday prior to April 15, although at the time of your visit he may have completed 18 years.

111. *Age in round numbers.*—In many cases persons will report the age in round numbers, like 30 or 45, or "about 30," or "about 45,"

when that is not the exact age. Therefore, when an age ending in 0 or 5 is reported, you should ascertain whether it is the exact age. If, however, it is impossible to get the exact age, enter the approximate age rather than return the age as unknown.

112. *Ages of children.*—Take particular pains to get the exact ages of children. In the case of a child not 2 years old, the age should be given in completed months, expressed as twelfths of a year. Thus the age of a child 3 months old should be entered as $\frac{3}{12}$, a child 7 months old as $\frac{7}{12}$, and a child 1 year and 3 months old as $1\frac{3}{12}$, etc. If a child is not yet a month old, enter the age as $\frac{0}{12}$. But note again that this question should be answered with reference to April 15. For instance, a child who is just a year old on the 17th of April, 1910, should nevertheless be returned as $1\frac{1}{12}$, because that is its age in completed months on April 15.

Aside from errors due to incorrect returns of ages, further errors in the age statistics for particular nativity and parentage classes of the population may result from erroneous returns as to the class to which the person enumerated belongs. For example, certain adults who are actually foreign born may be reported as native, and thereby the number in the adult ages may be exaggerated in the case of the native and understated in the case of the foreign-born population. Such errors in the return of persons according to nativity and parentage are probably more apt to occur in the case of males than in the case of females. They do not, of course, affect the age classification of the total population.

The accuracy of the age returns is tested and the results are discussed in the following pages.

Concentration on ages ending in 5 or 0.—There are several ways of testing the extent of the concentration upon ages ending in 5 or 0. Perhaps the most satisfactory is to compare the number of persons between 23 and 62 years whose ages are returned as multiples of 5 with one-fifth of the total number of persons from 23 to 62 years old, inclusive, these age limits being selected as covering the period within which the tendency to concentrate on multiples of 5 is most marked. If there were no concentration upon the years ending in 5 and 0 these two figures would be about equal. The greater the concentration, the greater will be the ratio which the first of these figures bears to the second. The ratio thus gives a measure of the inaccuracy of the replies to the age inquiry. Such a calculation is made for the age returns of the United States in 1910 in Table 1.

Table 1

CLASS OF POPULATION.	ONE-FIFTH OF TOTAL NUMBER OF PERSONS AGED 23 TO 62, INCLUSIVE: 1910			TOTAL NUMBER OF PERSONS FROM 23 TO 62 WHOSE AGE WAS REPORTED AS A MUL- TIPLE OF 5: 1910			INDEX OF CONCENTRATION—PER CENT THAT NUMBER REPORTED AS MULTIPLES OF 5 FORMS OF ONE-FIFTH OF TOTAL NUMBER AGED 23 TO 62 YEARS, INCLU- SIVE.		
	Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.
Total.....	8,605,240	4,524,988	4,080,252	10,337,363	5,431,434	4,905,929	120.1	120.0	120.2
Native white—Native parentage.....	4,210,921	2,173,068	2,037,853	4,713,320	2,421,332	2,291,988	112.1	111.4	112.7
Native white—Foreign or mixed parentage.....	1,594,353	790,499	803,854	1,789,774	878,473	911,301	112.3	110.5	114.0
Foreign-born white.....	1,936,362	1,117,510	818,852	2,504,499	1,459,194	1,045,305	129.3	130.0	127.7
Colored.....	863,579	443,911	419,668	1,324,264	676,630	647,634	153.3	152.5	154.2
Negro.....	820,653	412,149	408,504	1,268,954	629,396	639,558	153.4	152.9	154.0
Indian, Chinese, Japanese, and all other.....	42,926	31,762	11,164	66,310	47,034	18,276	152.1	143.1	163.7

For the total population in 1910 the index of the concentration on ages ending in 5 and 0 is 120.1, and is slightly higher for females than males. As might be expected, the concentration for the native white groups was less than that for any of the others. Next in order come the foreign-born whites, and in this group the concentration for the males exceeded that for the females. The highest concentration is shown for the negroes. At certain ages the concentration in the returns for the negro population was very great. Thus the total number of negro women reported at the ages of 68, 69, 71, and 72 combined in 1910 was 23,823, while the number reported at the age of 70 alone was 22,305. In a general way the percentage of concentration conforms to the percentage of illiterates in the several classes of the population and shows that the principal cause of inaccurate replies to the age inquiry is ignorance.

In Table 2 is shown the concentration on multiples of 5 for certain foreign countries in comparison with the concentration for the United States. In order to compare the concentration for countries using "year of birth" in the age inquiry with that for countries using "age at last birthday," the countries are arranged in two groups.

COUNTRY.	Date of census	One-fifth of total number of persons aged 23 to 62, inclusive.	Total number of persons from 23 to 62 whose reported age was a multiple of 5.	Index of concentration on multiples of 5.	Per cent of illiteracy. ¹
Countries where age inquiry called for year of birth					
Belgium.....	1900	613,744	615,595	100	18.0

¹ Percentage based on population 10 years of age and over, except as specified. Figures relate to same census as those of age, except France, 1906, and Canada, 1901.
² In population 15 years of age and over.
³ In population 12 years of age and over.
⁴ In population 5 years of age and over.
⁵ In population 6 years of age and over.
⁶ In population of all ages. This percentage is not comparable with the percentages based upon the population above some specified age.

It appears from this table that a number of the countries show much less concentration than the United States, most of these countries having a low percentage of illiteracy.¹ Several countries, however, show greater concentration than the United States.

It appears to be the degree of ignorance of the population rather than the form of the age inquiry which causes a high concentration on the years ending in 5 and 0.

In order to test whether there has been a gain or loss in the accuracy of the age statistics in this country, Table 3 is presented.

CENSUS YEAR.	INDEX OF CONCENTRATION ON AGES THAT ARE MULTIPLES OF 5.				Form of inquiry.
	Total population.	Native white.	Foreign-born white.	Total colored.	
1910.....	120.1	112.1	129.3	153.3	Age at last birthday.
1900.....	119.8	110.3	126.7	165.9	Date of birth and age at last birthday.
1890.....	131.3	119.4	142.3	180.8	Age at nearest birthday.
1880.....	144.8	123.7	162.4	223.7	Age at last birthday.

There was apparently a decided increase in accuracy down to 1900, followed by a very slight loss from 1900 to 1910 except among negroes. In 1900 both "age at last birthday" and "date of birth" were asked. By including two questions upon this subject the attention of the enumerator and of the person enumerated was directed toward this inquiry to a greater extent than in 1910, when only one question was asked. In 1910 the enumerators were instructed to enter the approximate age of a person rather than report it unknown. This instruction may have encouraged enumerators to record ages in years ending in 5 or 0 when the exact age could not be ascertained. There was no similar instruction to enumerators in 1900.

For the colored population there was a very decided gain between 1900 and 1910, corresponding with the marked decline in the illiteracy of the negroes. Naturally where the concentration is already comparatively slight it is more difficult to make further gains in accuracy. The concentration in 1910 was much less than in 1890 or 1880, when the form of inquiry was the same or substantially the same as in 1910.

Test of errors by "minus differences."—Another method by which the accuracy of age statistics may be tested is known as that of "minus differences." This test is made as follows:²

If the number returned at each year of age (except, of course, the number reported as "under 1") be subtracted from the number returned at the next lower year of age, the remainders will be the "first differences" of the age series. If these first differences be added, with due regard to plus and minus signs, the sum will, of course, be equal to the difference between the number reported as less than 1 year old and the number classified as "100 and over." But if the signs be disregarded in the addition, the sum of the differences will be equal to the difference between the numbers reported at the first and at the last age, plus twice the sum of the minus differences. It may be assumed that in a series representing the true ages of the population the minus differences are zero, or approximately zero, and the sum of all the differences would

¹ It should be noted that in practically all countries covered by the table for which census illiteracy statistics are not available the great bulk of the population is literate.

² Twelfth Census, Supplementary Analysis, p. 135.

therefore be the same whether plus and minus signs were regarded or not. The difference between the sum of the differences in the reported and in the actual ages would be, therefore, approximately twice the sum of the minus differences. It follows that the sum of the minus differences may be properly regarded as a measure of the inaccuracy of the reported ages. It will be noticed that in this method no assumption is made about the true nature of the age series, except that the minus differences are approximately zero. Even if this approximation is not very close, the general validity of the method is not affected. For the foreign-born element of the population, however, this method can not be used, as the fact that there are comparatively few foreign-born children among the population produces an unduly large number of minus differences.

In Table 4 is given for 1910 the number of persons 0 to 99 years of age for each of the principal classes of population except the foreign-born white, and the

“sum of the minus differences” in the numbers reported at successive ages. A calculation is then made in each case of the percentage that the sum of the minus differences forms of the total number of persons 0 to 99 years of age. Similar percentages are also given for three preceding censuses. These percentages are coefficients of error in the returns of age. Presumably because of the change in the form of the age inquiry, there was for all classes an increase in the coefficient of error from 1900 to 1910, although the change for the negroes was very small. In no case, however, did the coefficient in 1910 equal that in 1890 or 1880. For every class of the population the coefficient of error in 1910 was higher for females than for males.

CLASS OF POPULATION.	NUMBER OF PERSONS 0 TO 99 YEARS OF AGE: 1910			SUM OF MINUS DIFFERENCES: 1910			PER CENT THAT SUM OF MINUS DIFFERENCES FORMS OF PERSONS 0 TO 99 YEARS OF AGE.											
	Total.	Male.	Female.	Total.	Male.	Female.	1910			1900			1890			1880		
							Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.
Native white.....	68,277,928	34,579,851	33,698,077	2,088,601	1,014,062	1,145,531	3.1	2.9	3.4	1.4	1.5	1.5	5.4	5.4	5.9	4.5	4.2	5.1
Native parentage	49,390,627	25,160,269	24,230,358	1,522,318	754,116	817,214	3.1	3.0	3.4	1.5	1.6	1.6	5.7	5.9	6.2
For. or mixed par	18,887,301	9,419,582	9,467,719	580,625	264,932	330,453	3.1	2.8	3.5	1.4	1.4	1.4	4.4	4.4	4.9

Negro.....	9,794,048	4,867,801	4,926,247	1,006,181	509,604	506,613	10.9	10.5	11.5	10.4	9.6	11.2

Errors in reporting ages of children.—Another test of the accuracy of the replies to the age inquiry can be made by a study of the distribution by single years of age of children under 5 years.

Table 5 shows the distribution of the total, the native white, and the negro children under 5 years of age, by single years, as reported in 1910. If the enumeration were correct one would expect to find the largest number of children under 1 year of age, followed by a decrease in number year by year. For the total population the largest number was in fact that reported as under 1 year of age. The number reported as 1 year of age, however, was less than the number reported as 2, 3, or 4. This was true also for both the native white and the negro children. For the native whites the degree of accuracy is apparently considerably higher than for the negroes. In this latter group the number reported as under 1 year was lower than the number reported as 2, 3, or 4 years of age, and the number reported as 4 years old was higher than that for any other age under 5.

AGE.	POPULATION UNDER 5 YEARS: 1910					
	All classes.		Native white.		Negro.	
	Number.	Per cent distribution.	Number.	Per cent distribution.	Number.	Per cent distribution.
Total under 5 years.....	10,631,364	100.0	9,220,407	100.0	1,263,288	100.0
Under 1 year.....	2,217,342	20.9	1,948,870	21.1	252,386	20.0
1 year.....	1,976,472	18.6	1,736,684	18.8	219,240	17.4
2 years.....	2,166,492	20.4	1,878,677	20.4	260,037	20.6
3 years.....	2,156,141	20.3	1,854,182	20.1	264,547	20.9
4 years.....	2,114,917	19.9	1,801,994	19.5	267,078	21.1

Table 6 gives the percentage in each year of age of the total population under 5 at each census from 1880 to 1910.

AGE.	PER CENT DISTRIBUTION OF POPULATION UNDER 5 YEARS OF AGE.			
	1910	1900	1890	1880
Under 5 years.....	100.0	100.0	100.0	100.0
Under 1 year.....	20.9	20.9	20.5	20.9
1 year.....	18.6	19.3	14.1	18.2
2 years.....	20.4	20.0	22.7	20.6
3 years.....	20.3	19.9	21.4	20.0
4 years.....	19.9	20.0	21.3	20.3

In all the enumerations from 1880 to 1910 the number of children reported as 1 year of age was lower than the number reported as of any other age under 5. The difference was greatest in 1890 and least in 1900.¹ In 1910 for the first time the number of children reported as 4 years of age was lower than the number at any other age with the exception of the number 1 year of age. In both 1900 and 1910, therefore, the accuracy in the reported age of children seems to have been greater than at either of the two preceding censuses.

In order to compare the accuracy of the reported age for children under 5 years in the United States with that in foreign countries, Table 7 is presented.

¹ Comparisons with 1890 are doubtless affected by the variation in the form of the age question, which at that census read “age at nearest birthday” instead of “age at last birthday.” At the same time the enumerators were required to report persons under 1 year of age in months, so that the period “under 1 year of age,” as at other censuses, included every one under 12 months of age, but “1 year of age,” so far as instructions were strictly followed, included only those between 12 and 18 months of age.

¹ Percentage based on population 10 years of age and over, except as specified. Figures relate to same census as those for age, except as follows: France, 1906; New Zealand, 1906; Cuba, 1899; Mexico, 1900; Roumania, 1909.

² In population 15 years of age and over.
³ In population 12 years of age and over.
⁴ Population under 5 years of age on Jan. 1, 1901, as enumerated on Feb. 10, 1901.

⁵ In population 6 years of age and over.
⁶ In population of all ages. This percentage is not comparable with the percentages based upon the population above some specified age.

⁷ In population 5 years of age and over.
⁸ The percentage under 2 years of age was 35.8.
⁹ In population 11 years of age and over.
¹⁰ In population 7 years of age and over.

In certain of these countries the returns are evidently more accurate than in the United States, since there is not that decided reduction in the proportion reported as 1 year old followed by an increase for the following year which characterizes the returns in this country. Such countries generally have a low percentage of illiteracy. A number of the countries, particularly in the second group, however, show very remarkable variations. It is probable that illiteracy is responsible for most of the anomalies shown in the table, and that the form of the age inquiry does not materially affect the results.

Erroneous reports of centenarians.—Persons of advanced age sometimes knowingly report themselves to the enumerators as older than they actually are, or, not knowing their true ages, they make exaggerated

guesses. This tendency has long been known with regard to centenarians. Careful investigations made in various foreign countries regarding those who report themselves to be 100 years of age or over have usually resulted in a very considerable reduction in the number. A limited number of special cases of reported centenarians have been investigated by the Census Bureau from time to time, and it has been found that the returns were often positively erroneous or of very doubtful validity.

It is a significant fact that as census practices become better perfected and as the people become more intelligent succeeding censuses show a decreasing proportion of centenarians. This is true both in the United States and in foreign countries. Indeed the absolute number of centenarians often shows a decline even where population as a whole is increasing.

In Table 8 is given the distribution by sex and class of population of all persons reported as 100 years of age or over in the United States in 1910.

CLASS OF POPULATION AND SEX.	CENTENARIANS REPORTED: 1910	
	Number.	Per cent distribution.
Total.....	3,555	100.0
Male.....	1,380	38.8
Female.....	2,175	61.2
White.....	764	21.5
Male.....	326	9.2
Female.....	438	12.3
Native white.....	471	13.2
Male.....	200	5.6
Female.....	271	7.6
Native parentage.....	439	12.3
Male.....	180	5.1
Female.....	259	7.3
Foreign or mixed parentage.....	32	0.9
Male.....	20	0.6
Female.....	12	0.3
Foreign-born white.....	293	8.2
Male.....	126	3.5
Female.....	167	4.7
Colored.....	2,791	78.5
Male.....	1,054	29.6
Female.....	1,737	48.9
Negro.....	2,675	75.2
Male.....	1,004	28.2
Female.....	1,671	47.0

The total number of centenarians reported at the census of 1910 was 3,555, of whom 1,380 were males and 2,175 females. Only a little over one-fifth of these reported centenarians were white, while over three-fourths were negroes.

The proportion of reported centenarians in the total population by class and sex is shown in Table 9.

CLASS OF POPULATION.	CENTENARIANS REPORTED PER 100,000 IN EACH CLASS AND SEX: 1910		
	Both sexes.	Male.	Female.
Total.....	3.9	2.9	4.9
White.....	0.9	0.8	1.1
Native white.....	0.7	0.6	0.8
Native parentage.....	0.9	0.7	1.1
Foreign or mixed parentage.....	0.2	0.2	0.1
Foreign-born white.....	2.2	1.7	2.9
Colored.....	27.3	20.5	34.2
Negro.....	27.2	20.5	33.8

In order to compare the proportion of reported centenarians with the percentage of illiteracy for the different classes of the population at the last three censuses, Table 10 is introduced.

CLASS OF POPULATION.	1910		1900		1890	
	Centenarians reported per 100,000. ¹	Illiterates per 100. ¹	Centenarians reported per 100,000. ¹	Illiterates per 100. ¹	Centenarians reported per 100,000. ¹	Illiterates per 100. ¹
White.....	1.2	5.0	1.6	6.2	2.5	7.7
Native white.....	0.9	3.0	1.1	4.6	2.0	6.2

Negro.....	36.6	30.4	39.8	44.5	(?)	57.1

¹ Ten years of age and over.

² Figures not available.

It is evident from this table that there is a relationship between illiteracy and the number of reported centenarians in the different groups. For every class of the population there has been a decrease in the percentage of illiterates from 1900 to 1910, and at the same time a decrease in the proportion of reported centenarians. At each census the proportion of centenarians varied in harmony with the proportion of illiterates in the several classes of the population. From the general difference in age distribution between the two classes it is to be expected that the proportion of centenarians among the native whites of foreign or mixed parentage should be lower than that among those of native parentage. There is, however, no reason to suppose that the proportion of actual centenarians among the negroes is materially higher than among the native whites of native parentage. Ignorance evidently is a large factor in the returns.

In Table 11 is given the proportion of reported centenarians in the total population and in the principal classes of the population from 1850 to 1910.

CLASS OF POPULATION AND SEX.	CENTENARIANS REPORTED PER 100,000.						
	1910	1900	1890	1880	1870	1860	1850
Total.....	3.9	4.6	6.4	8.0	9.1	9.4	11.0
Male.....	2.9	3.3	4.4	5.5	6.6	7.7	9.1

Foreign or mixed parentage.....	0.2	0.3	0.5
Male.....	0.2	0.3	0.4
Female.....	0.1	0.4	0.6
Foreign-born white.....	2.2	3.8	4.4	5.5	5.9
Male.....	1.7	3.2	3.6	4.4	4.6
Female.....	2.9	4.5	5.3	6.8	7.3
Colored.....	27.3	29.2	38.3	45.3	51.5	44.8	48.6
Male.....	20.5	20.5	25.5	30.0	36.2	37.3	39.8
Female.....	34.2	38.0	51.4	60.8	66.5	52.4	57.3
Negro.....	27.2	29.1	52.0	43.7	48.6
Male.....	20.5	20.3	37.0	36.0	39.8
Female.....	33.8	37.7	66.4	51.3	57.3

In the total population the number of centenarians per 100,000 population was 11 in 1850 and declined

at each census, reaching 3.9 in 1910. For both males and females among the total white population the proportion in 1850 was over four times as high as in 1910. For the colored the proportion was 48.6 to 100,000 in 1850 as compared with 27.3 in 1910.

It is true generally that the countries showing high proportions of centenarians show also high proportions of illiterates. In Table 12 are given the statistics of centenarians and of illiteracy for various foreign countries.

¹ Percentage based on population 10 years of age and over, except as specified. Figures relate to same census as those for centenarians, except that the figures for Cuba relate to 1899.

² In population 6 years of age and over.

³ In population 7 years of age and over.

⁴ In population of all ages. This percentage is not comparable with the percentages based upon the population above some specified age.

⁵ In population 15 years of age and over.

⁶ Less than one-tenth of 1 per 100,000.

⁷ In population 12 years of age and over.

Persons of unknown age.—For a limited number of persons—mainly, in all probability, adults—no age returns are secured by the census. The number of such persons furnishes an index of some value as to the degree of accuracy and completeness of census data. Table 13 shows these numbers for 1910 for all classes of the population.

The total number of persons in 1910 whose ages the enumerators were unable to learn was 169,055, of whom 114,443 were males and 54,612 females. The probable reason for the fact that there were over twice as many males as females of unknown age is that there were more males than females away from home at the time the enumerator called and therefore more as to whose age the person who furnished the information was ignorant.

CLASS OF POPULATION.	PERSONS OF UNKNOWN AGE: 1910		
	Total.	Male.	Female.
Total	169,055	114,443	54,612
Native white:			
Native parentage.....	97,509	68,789	28,740
Foreign parentage.....	7,585	4,096	3,489
Mixed parentage.....	2,919	1,641	1,278
Foreign-born white	26,211	19,706	6,506
Black	26,532	14,177	11,355

Indian	949	481	468
Chinese	1,529	1,519	10
Japanese	1,210	1,154	56
All other	103	101	2

In Table 14 is given the number of persons of unknown age per 100,000 in each class of population in 1910, 1900, and 1890.

CLASS OF POPULATION.	NUMBER OF PERSONS OF UNKNOWN AGE PER 100,000.		
	1910	1900	1890
Total	183.8	263.9	259.0
Native white:			
Native parentage.....	197.0	273.6	255.6
Foreign or mixed parentage.....	55.6	52.0	75.7
Foreign-born white	196.4	243.6	209.9
Colored	340.1	604.6	537.1
Negro.....	315.8	552.5	479.4
Indian.....	357.2	1,953.7	2,642.6
Chinese	2,137.5	1,300.0	3,388.7
Japanese	1,676.9	3,773.7	735.7
All other	3,249.2

In the total population in 1910 there were 183.8 persons per 100,000 whose ages were reported as unknown. For the native whites of foreign or mixed parentage the proportion was only 55.6. The proportions for native whites of native parentage and for foreign-born whites were almost identical; those for the various colored races were much higher.

From 1890 to 1900 there was a slight increase in the proportion of persons of unknown age, while from 1900 to 1910 there was a decided reduction in the proportion. It is doubtful whether these changes represent corresponding changes in accuracy of enumeration. They may be due to the fact that in 1900 a question concerning date of birth was added to that as to age at last birthday. It is possible that many persons who in ignorance of their exact age would report themselves as "about 45," would be unwilling to estimate their ages if there was an additional question requiring them to state the date of birth. In this case they might be more inclined frankly to state that their ages were unknown. It is more probable that a difference in the instructions to enumerators accounts, in part, for the decrease from 1900 to 1910 in the number whose ages were reported as unknown. Included in the 1910 instructions was the following sentence: "If, however, it is impossible to get the exact age, state the approximate age rather than return the age as unknown." This was not in the instructions in 1900.

The practice of returning estimated ages undoubtedly results in some loss of accuracy in the detailed age classification by increasing the concentration on

multiples of 5, but it probably renders the classification of population by broad age groups more complete and accurate than it would be if ages which must be estimated were in each case reported as unknown.

Sex ratios as a test of age returns.—Still another method of testing the accuracy of age returns is to compare the number of males with the number of females in different individual ages or age groups. In a population not affected by immigration or emigration there should be no very great disparity in the numbers of the two sexes, except perhaps in the advanced ages. There is no method by which the true ratio of the sexes in any given age group can be exactly determined and compared with the reported ratio, but where the departure from equality exceeds a certain limit it is a presumptive evidence of error.

For the total population it is not possible to apply this test to age returns in the United States because of the large foreign-born population, the sex distribution of which is entirely abnormal. For the native classes of the population, however, the test can be applied. It should be noted, however, that errors revealed by this test may result not only from incorrect returns of age but also from incorrect returns of the class of the population to which the person enumerated belongs.

It will be preferable to discuss the application of this test to the age statistics of the United States in connection with the presentation and discussion of the actual figures showing the age distribution of the two sexes. Attention may, however, be called to certain figures which prove beyond question the existence of errors in the returns of the ages of women.

In 1900 there were 4,988,588 native white males of native parentage reported as 5 to 14 years of age. Persons in the age group 5 to 14 in 1900 would be in the age group 15 to 24 in 1910 if still living. The number of native white males of native parentage reported in the age group 15 to 24 years in 1910 was 4,885,442. The comparison, as would be expected, shows a decrease, attributable to the deaths which had occurred during the intervening 10 years. In case of the native white females of native parentage, however, 4,846,022 were reported in the age group 5 to 14 in 1900, and 4,886,535 in the age group 15 to 24 in 1910, an increase of 40,513 during the 10 years. This is an impossibility, since the numbers from 15 to 24 years in 1910 are the survivors of those aged 5 to 14 years in 1900. The probable explanation is that a very large number of females who should have returned their ages as 25 years or older in 1910 actually returned their ages as under 25 years. A similar condition appeared with respect to native white women of foreign or mixed parentage in 1900 as compared with 1890.

Degree of accuracy in age returns.—From what has been said in the preceding discussion it is evident that there is a large margin of error in the age returns for individual years of age sufficient in the case of

the years of infancy and of the years beyond the period of youth to invalidate largely calculations of death rates and of other statistical averages or percentages based on the uncorrected figures for individual years of age. It is believed, however, that for the period of childhood (not including the first three or four years of life) and youth the figures are sufficiently accurate to give value and significance to percentages and averages relating to such subjects as mortality, illiteracy, school attendance, employment, and marital condition. It is only during these periods that the variations from year to year are of great importance. In the older periods of life the changes that come with advancing years are more gradual, so that the differences between any year and the next older or younger year are not marked, and it is sufficient for most purposes if the data can be presented with approximate accuracy by 5-year or even broader age groups. The figures for individual years of age, for the United States as a whole, are, however, published in this report for the convenience of those who wish to make combinations of ages into groups other than those made by the Census Bureau, and of those who may be interested in the question of the accuracy of age returns or may wish to apply mathematical methods to "smoothing" the age curves in order to determine, if possible, the actual age distribution by individual years. The figures for individual years up to 24, being regarded as more important and as sufficiently accurate for many statistical purposes, are presented by divisions and states and for cities of 500,000 inhabitants or more.

For most practical purposes of statistical analysis it is sufficient to make use of age groups. An important practical question, therefore, concerns the accuracy of the returns when combined into such age groups.

The analyses already presented with reference to the accuracy in detail of the age statistics throw, of course, some light upon the broader question of the accuracy of statistics by age groups. In those countries where there is very little concentration of age returns on multiples of 5 and where the numbers of centenarians reported are not unreasonably great, it may be assumed that the statistics for age groups are substantially correct. In countries like the United States, where tests regarding these conditions show plainly a considerable margin of error, it may be presumed that the statistics for age groups are less accurate than in countries of the class just named; but it does not follow that the degree of inaccuracy is so great as to affect very seriously the value of the statistics. For example, there might be very considerable concentration on multiples of 5 without any material error in totals for groups of 5 years, since errors within any age group—wrongly transferring a certain number of persons from one year of age to another year in the same group—do not affect the total for the group. In each age group a certain number of persons are reported who do not belong there;

but, on the other hand, a certain number who do belong there are reported elsewhere, in a younger or older group. The inaccuracy of the total number for the group is simply the difference between these numbers. It follows, of course, that the actual number reported in any group might be absolutely correct and at the same time the composition of the group be more or less erroneous, in that it included a certain number of persons who did not belong there and failed to include an equal number who did belong there.

Two rather important sources of error in the age statistics, other than mere ignorance of exact age, have already been mentioned. The first is the apparent tendency to understate ages in the case of adults not in the most advanced ages, this tendency seeming to be particularly common among women. The understatement, sometimes intentional, may in other cases be due to a tendency to underestimate when the exact age is not known. The second is the liability, apparently greater in the case of adult men than of women or children, of error in returns according to race, and more generally according to nativity and parentage. Errors in the returns as regards color or race, nativity, and parentage are not of a character to counterbalance one another within any given nativity or parentage group, although they do not affect the accuracy of the age distribution of all classes combined; that is to say, of the total population.

The tendency to understate age, particularly on the part of women, seems to exist among all classes of the population, but to be more conspicuous in the case of some classes than of others. As a result of such understatement the numbers in the early ages of adult life are probably exaggerated and the numbers in late middle life made too small. The tendency to overstate age in the case of those who are actually of advanced age is not very serious in its results, since it affects only a small proportion of the population.

Erroneous returns of nativity and parentage probably diminish the proportion of adults in the classes which lose in numbers, and increase the proportion of adults in the classes which gain in numbers by such errors. More specifically, there seems little doubt that a certain number of the foreign born are reported as native born of foreign parentage, or even as native born of native parentage in some cases, and that a certain number of native whites of foreign parentage or of mixed native and foreign parentage are reported as natives of pure native parentage.¹ Errors in the opposite direction are probably comparatively rare. Consequently, since these errors are largely confined to the adult population, there is probably to some extent an understatement of the number of adults among the foreign-born whites and

¹ This source of error is augmented somewhat by the practice of the Census Bureau in counting as native of native parentage all persons for whom the enumerators make no return as to place of birth and parentage, or whom they return as born in the United States, without stating the place of birth of the parents. Such cases are, however, relatively few.

an overstatement of the number among the native whites of native parentage. It may readily be, however, that the native whites of foreign or mixed parentage gain from the foreign born about as many as they lose to the natives of native parentage.

It seems likely that the age statistics of the two sexes are somewhat differently affected as the combined result of these two classes of errors. In the case of women of all classes there is probably an undue concentration in the early adult ages, combined with a deficiency in the middle-age groups. In the case of men of all classes combined, as well as of negro men, there is probably little error in the very broad age groups, though there is unquestionably some in 5-year groups in the case of negroes at least, but in the case of native white men of native parentage there is probably some excess throughout the adult ages especially the middle and advanced ages, while for the foreign-born white men the error is presumably the converse.

The effect of these probable errors in age-group statistics can be seen more clearly by means of the ratios of males to females in the several age groups than in any other way. These ratios are presented and discussed in a later section of this chapter.

It should be stated with emphasis, however, that, despite these probable tendencies toward biased errors—as distinguished from unbiased and more or less counterbalancing errors—in the age statistics, the margin of error in the case of statistics for 5-

year groups, and more particularly in statistics for broader age groups, is in most cases not sufficiently great to affect materially the conclusions as to the general age distribution of the several classes of the population of the United States. Moreover, the errors have apparently been in the same direction and of approximately the same relative magnitude at different censuses, so that the changes from one census to another with respect to age distribution are probably shown with substantial correctness.

UNITED STATES AS A WHOLE.

Table 15 shows, for 1910, the distribution of the total population of the United States, by principal color or race, nativity, and parentage classes, according to six age groups. The years under 5 may be roughly designated as early childhood, those from 5 to 14 as the school period, those from 15 to 24 as the period of youth, those from 25 to 44 as the prime of life, those from 45 to 64 as middle or late middle life, and those from 65 upward as old age. In this, as in most of the following tables, the insignificant number of persons of unknown age is not shown separately but is included in the totals upon which the percentages for the several age groups are based. The percentages would scarcely differ at all from those given here if they were based on the population of known age instead of on the total population. The percentages shown in Table 15 are also indicated graphically by the diagram on the next page.

¹Includes persons of unknown age.

Of the population of the country as a whole in 1910, children under 5 years of age formed 11.6 per cent; children from 5 to 14, 20.5 per cent; young persons from 15 to 24, 19.7 per cent; men and women from 25 to 44, 29.1 per cent; those from 45 to 64, 14.6 per cent; and those of 65 and over, 4.3 per cent.

This table and the diagram bring out clearly the differences among the several classes of the population with respect to age distribution. The most conspicuous feature of the statistics is the abnormal age

distribution of the foreign-born white, a distribution which affects materially that of the population as a whole. Were it not for immigration, the total population of the United States would show a somewhat smaller proportion of adults and a somewhat larger proportion of children. Of the foreign-born whites in 1910 no less than 44.1 per cent were in the age group 25 to 44 years and only 5.7 per cent in the two age groups below 15 years, while among the native whites of native parentage the corresponding percentages were 26.2 and 35.8.

DISTRIBUTION BY AGE PERIODS OF THE TOTAL POPULATION, AND OF EACH CLASS: 1910.

The age distribution of the native white population is itself affected indirectly by immigration. The extent to which it has been so affected is, however, not easy to determine, depending largely upon variations in volume of immigration. A great wave of immigration would normally be followed by a very material increase in the proportion of children in the native population. If the immigration continued in undiminished volume, however, the effect would become less marked as time went by. On the other hand, a sudden cessation or falling off of immigration would be followed by an immediate falling off in the proportion of children in the native population, and here again the effect would tend to disappear if immigration was not resumed on its earlier scale.

The influence of immigration upon the age composition of the native population is most direct and obvious for that class of the native population which is composed of persons whose parents, one or both, were immigrants—the native white of foreign or mixed parentage. As compared with the native white of native parentage this class had in 1910 a larger proportion in each age group under 45.

Even the native white population of native parentage is indirectly affected in its age distribution by immigration, since the children of the native whites of foreign or mixed parentage are included in the class of native whites of native parentage. The negroes, are, of course, practically not affected at all by immigration.

Among the native whites of native parentage the percentage of persons in the older groups was higher than among the negroes. In 1910, 18 per cent of the former were 45 years of age or over, as compared with

14.3 per cent of the latter. There was, however, no very great difference between the two classes with respect to the relative numbers of children. While the proportion of children under 5 was slightly higher in the case of the native whites of native parentage, the proportion of children from 5 to 14 was appreciably higher in the case of the negroes. It may be stated in this connection that the detailed statistics by single years of age seem to indicate a tendency among the negroes to overstate the ages of children, which may, at least in part, account for the relationship of the proportions just mentioned.

There can be little doubt that the higher proportion of persons 45 years of age and over among the native whites of native parentage as compared with the negroes is partly due to a lower death rate. It might, however, also be attributable to differences in the birth rates of the two classes or to differences with respect to changes in the birth rate from one period to another. A decline in the birth rate is a factor which tends to reduce the relative importance of the younger age groups and to increase that of the older. It is practically certain that the birth rate in the case of the white population of native stock has been declining for many years. If there is a similar tendency among the negroes, it is probably of more recent origin than it is in the case of the whites. It should be noted that while a low death rate may tend to make the proportion in the older age groups high, any rapid reduction in death rates, such as, for example, one due to an improvement in sanitary conditions, is likely, at least for the time being, to raise the proportion of young children by a relatively greater saving of young lives, even where the reduction of mortality affects all ages.

It will be observed that the native whites of mixed parentage show a higher proportion of persons in the age groups under 25 years than the native whites of foreign parentage. This may be due, in some part, to the erroneous reporting of adult native whites of mixed parentage as being either native whites of foreign parentage or native whites of native parentage, but it is a condition which would indicate that the proportion of immigrants marrying natives has increased in recent years. One of the circumstances tending to account for this increase is the probability that a larger proportion of the immigrants arriving before 1880 than of later arrivals were married before coming to this country; another is the fact that the number (although not necessarily the proportion) of foreign born who have been in this country long enough to become assimilated is increasing, and that the number of natives of foreign or mixed parentage, who are more likely to marry immigrants than are natives of native parentage, is also constantly increasing. (For further discussion of the causes which promote intermarriage, see Chapter II, Color or Race, Nativity, and Parentage, p. 142.)

Among the Chinese and Japanese the age distribution was even more abnormal than it was among the foreign-born whites. The great bulk of the persons of both of these races are immigrants, and most of these immigrants are adult males who have left their families, if they have any, at home. Only 5.9 per cent of the Chinese in 1910 were under 15 years of age, and only 6.9 per cent of the Japanese. There are relatively far more Chinese than Japanese over 45 years of age, a condition due to the restriction of Chinese immigration in recent years. The age distribution of the small class designated "All other," consisting of Hindus, Filipinos, Koreans, and Maoris, is roughly similar to that of the Japanese.

The age distribution of the Indians, which is practically not affected by migration, was roughly similar to that of the negroes and the native whites of native parentage, but the proportion of children was higher, and that of persons in the ages 15 to 44 lower, than in the case of either of the other two classes. The chief, and perhaps the sole, explanation of this fact

is to be found in the effect of intermixture of white and Indian blood. The children born of marriages between Indians and whites are all classified as Indians, while only one of the parents in each marriage is classified as Indian. Since intermarriages between Indians and whites are increasingly frequent, the number of Indian-white mixed bloods is increasing and is relatively greater among children than among older persons. The inclusion of these children with the Indian population, together with the exclusion of a certain number of parents, tends to increase the proportion of children and to diminish the proportion of adults in the Indian population.

Comparison with previous censuses, by broad age groups.—Table 16 and the diagram on the next page present comparative statistics according to broad age periods for the total population and for the principal classes of the population at the censuses of 1910, 1900, and 1890. The native whites of foreign parentage were not distinguished from those of mixed parentage in 1890 in the tabulation by age.

¹ These figures are estimates. The negro population under 15 years of age was shown by the 1890 census and was 3,174,769, but the number under 5 and the number from 5 to 14 were not distinguished. This distinction was, however, made for the total colored population, the figures being 1,065,045 and 2,142,367, respectively. Applying to the figure for the negroes under 15, the same proportions for the two age groups as were found for the total colored, the figures and percentages given in the table have been calculated. There is no appreciable error, since the negroes constitute the great bulk of the colored and since there is no very material difference between the negroes and the other colored with respect to the distribution of the persons under 15 between the two age groups.

This table shows, for the total population, a decline in each decade in the proportion of children and an increase in the proportion of persons in the three age groups for the ages 25 years and over. In 1890, 35.5

per cent of the total population were reported as under 15 years of age, while in 1910 the corresponding proportion was 32.1 per cent. The proportion from 15 to 24 years of age was slightly higher in 1910 than in 1900,

but appreciably lower than in 1890. The proportion 25 years of age and over rose from 43.9 per cent in 1890 to 45.8 per cent in 1900 and to 48 per cent in 1910.

DISTRIBUTION BY AGE PERIODS OF THE TOTAL POPULATION, AND OF EACH PRINCIPAL CLASS: 1910, 1900, AND 1890.

Among the native whites of native parentage there was substantially no change between 1890 and 1910 in the proportion of children under 5 years of age, but a gradual decline appears in the proportion from 5 to 14 years of age. The proportion over 44 years of age rose from 17.2 per cent in 1890 to 18 per cent in 1910.

A very considerable change has taken place since 1890 in the age distribution of the native whites of foreign or mixed parentage. Probably the chief cause of this change is found in the variations in the volume of immigration at different periods. Since there was no very large immigration into the United States prior to 1840, it was but natural that in 1890 there should not be many persons 45 years of age or over whose parents were born abroad, and as immigration increased rapidly after 1840 the proportion 45 years of age and over naturally increased in the years from 1890 to 1910.

Changes in the age distribution of the foreign-born whites from census to census are materially affected both by the volume of immigration and by differences in the age distribution of the persons arriving at different periods. That the proportion of children under 15 years among the foreign-born whites was materially higher in 1890 than at either of the two succeeding censuses is doubtless attributable largely to the fact that the immigration of families was more common before 1890 than subsequently. That the proportion

of persons 65 years of age and over advanced materially between 1890 and 1900 was presumably due chiefly to the small immigration of that decade, though it may in some degree reflect the large increase in immigration about the middle of the last century. The subsequent decline in the proportion of this age, as well as in the proportion from 45 to 64 years is probably attributable largely to the extensive immigration of young adults during the decade 1900-1910.

Among the negroes the changes in age distribution since 1890 have been somewhat more conspicuous than among the native whites of native parentage. The proportion of children under 15 fell from 42.5 per cent in 1890 to 39.8 per cent in 1900 and to 37.3 per cent in 1910, while the proportion of persons of 45 and over rose from 13.1 per cent in 1890 to 14.3 per cent in 1910. Since this class in the population is not appreciably influenced by immigration, changes in birth and death rates must be responsible for the changes in the age distribution.

The changes in the age distribution of the total population according to broad groups of ages are shown, for each census from 1870 to 1910, in Table 17.

AGE PERIOD.	POPULATION.				
	1910	1900	1890	1880	1870

¹ Less than one-tenth of 1 per cent.

This table shows that the tendencies manifest since 1890 are substantially continuations of tendencies present also during the two preceding decades. In the total population the proportion under 5 years of age fell steadily from 14.3 per cent in 1870 to 11.6 per cent in 1910. The proportion 45 years of age and over advanced steadily from 14.9 per cent in 1870 to 18.9 per cent in 1910. In each decade the proportion in the active producing ages, 25 to 64 years, increased, and the productive strength of the population has thus become greater, while the proportion in the dependent ages of childhood has become smaller.

Comparison with foreign countries.—In Table 18 is given, by percentages, the age distribution of the population of leading foreign countries, the age groups being in most cases the same as those shown in preceding tables for the United States. In the case of certain countries, however, it is impossible to make precisely comparable age groups, and the available statistics for such countries are presented with accompanying notes.

Table 18

¹ Less than one-tenth of 1 per cent.
² All races.
³ Percentages given are for age groups 45 to 59 and 60 and over, respectively.
⁴ Europeans only.
⁵ Percentages given are for age groups 25 to 45, inclusive; 46 to 65, and 66 and over, respectively.
⁶ Percentages given are for age groups 15 to 23, 24 to 43, 44 to 63, and 64 and over, respectively.
⁷ The age grouping runs one year in advance of the groups adopted for this table, being as follows: Under 6, 6 to 15, 16 to 25, etc.
⁸ Percentages given are for age groups 5 to 15, inclusive; 16 to 25, 26 to 45, and 46 to 60, respectively.

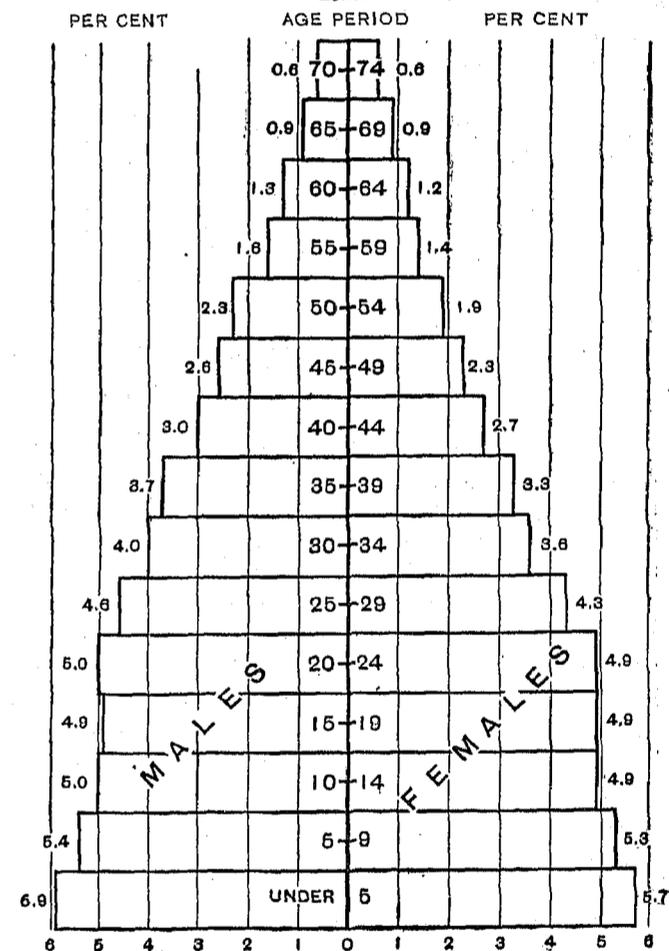

In most foreign countries the proportions of the population under 5 years and from 5 to 14 years of age are larger than in the United States. There are a few countries in which this is not true. In France and Ireland the proportion of children under 15 is considerably smaller than it is in the United States. Among European countries the proportion under 15 is highest in Bulgaria. The proportion in the middle age group, embracing the ages 25 to 44 years, is in most countries smaller than it is in the United States, the proportion in this age group being smallest for Bulgaria. In general those countries which have lost large numbers of emigrants are likely to have a somewhat smaller proportion in the age group 25 to 44 than other countries have.

A small proportion in the upper age groups may be due to a high birth rate, a high death rate, or to recent settlement of the country. The low birth and death rates of France, and particularly the decline in the birth rate, are reflected in a large proportion in the ages from 45 to 64 and from 65 upward, while, conversely, the high birth and death rates in Russia are reflected in a very small proportion in these ages.

Classification by 5-year age periods: 1910.—Table 19 shows, for 1910, by 5-year age periods, the population of the United States as a whole and the numbers in each of the principal color or race, nativity, and parent-age classes, with a further distinction according to sex. Table 20 shows the relative importance of the different age groups by means of percentages.

The facts brought out by the tables can be much more clearly shown by means of diagrams. While the diagram already presented, showing statistics by individual years of age, is rendered confusing by the concentration on ages ending in 5 and 0, a diagram for quinquennial age groups shows with approximate correctness the true distribution of the population.

DISTRIBUTION BY AGE PERIODS AND SEX OF TOTAL POPULATION: 1910.

This diagram presents the age distribution of the total population according to sex. The percentages which are shown in connection with the diagram differ from those in Table 20, being designed to permit a comparison of the relative numbers of males and females in each age group. In Table 20 the percentage distribution by age for males is based on the total male population and that for females on the total female population, but in the diagram the percentages for each sex are based upon the total population. For

AGE DISTRIBUTION.

example, the diagram shows that males 15 to 19 years of age formed 4.9 per cent of the total population, while, as shown in Table 20, they formed 9.6 per cent of the male population.

As already stated, where the population is maintained entirely by natural increase the numbers will, under all ordinary conditions, diminish with advancing age, so that if the figures for the two sexes are represented by 5-year age groups on opposite sides of a vertical axis the diagram takes approximately the form of a pyramid or triangle. The death rate, however, is not uniform at all ages. It is very high during the first year after birth, decreases rapidly during early infancy and gradually thereafter until about the twelfth year; it then increases slowly until past middle life, after which the advance in the rate is rapid. As a result of these variations the age diagram

for a normal population is not a perfect pyramid but is slightly bell-shaped. There is also some difference between the two sexes in a normal population dependent upon the sex ratio at birth, and the mortality rate for each sex at each age; so that the age pyramid is not entirely symmetrical.

In the case of the United States the distribution by age, and more especially by sex at different ages, is materially affected by the presence of the foreign born. The bars in the diagram for the total population which represent the age periods of adult life are somewhat longer, particularly for males, than they would be for a population recruited solely by natural increase.

The wide differences in the age distribution of the principal classes of the population are best shown by the four diagrams on page 315, similar to the diagram for total population.

DISTRIBUTION BY AGE PERIODS OF THE POPULATION OF THE UNITED STATES: 1910.

¹ Less than one-tenth of 1 per cent.

No two of these diagrams are identical in form, and the only one whose shape has not been influenced more or less by immigration, either directly or indirectly, is that representing the negro population, although the diagram for the native whites of native parentage is comparatively little affected by this factor. The extraordinary character of the age distribution of the foreign-born whites, which has already been brought out in the tables showing broad age groups, is clearly apparent in the diagram for that class, as is also the great excess of males over females among adults.

Aside from the broad general differences in the shape of the age diagram for the three native classes, the nature of which will be readily apparent from the preceding discussion of the broader age grouping, there are certain more or less conspicuous differences in detail, some of which are doubtless attributable, at least in part, to error. For instance, there can be little doubt that in the case of the negroes the very little difference between the length of the bar for children under 5 and that of the bar for children 5 to 9 years of age is partially the result of errors, either from the omission of very young children altogether or from overstatement of the ages of children. A very similar condition appeared in the statistics for the negro population at earlier censuses. The peculiar variations shown in the diagram for the native whites of foreign or mixed parentage are presumably due, at

least in part, to variations in the character and extent of immigration from one period to another.

The diagram below, based on absolute numbers, is designed to show primarily the contrast in age distribution between the native population, white and negro, and the foreign-born white population.

DISTRIBUTION BY AGE PERIODS OF THE NATIVE WHITE, NATIVE NEGRO, AND FOREIGN-BORN WHITE POPULATION: 1910.

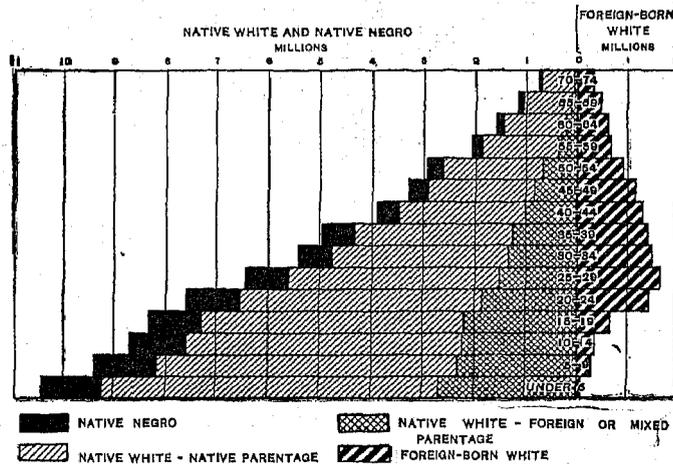

Table 21, which is in the nature of a supplement to the two preceding tables, shows the statistics according to 5-year age groups for the native whites of foreign parentage and the native whites of mixed parentage separately, while Table 22 presents similar statistics for the Chinese, Japanese, and "all other" separately.

Classification, by 5-year age periods, of the total population: 1880-1910.—Table 23 shows, for each census from 1880 to 1910, in absolute numbers and percentages, the classification of the total population of the United States according to 5-year age periods, the number under 1 year of age being also distinguished. The general nature of the changes shown in this table has already been indicated in the discussion of the statistics for broader age groups.

² Less than one-tenth of 1 per cent.

Age distribution, by sex.—For 1910, the distribution of males and females according to six broad age periods is shown, on the next page, in Table 24 and in the diagram, for the population as a whole and for each of the principal classes of the population.

Differences in age distribution as between the males and the females in the total population of the country are to be expected, by reason of the fact that the foreign born, whose age distribution is abnormal, include many more males than females. In this condition lies in part the explanation of the fact that in the total population a larger proportion of the males than of the females are in the ages 25 to 64, inclusive. In 1910, 44.8 per cent of the males and 42.6 per cent of the females were reported as from 25 to 64 years of age. Correspondingly there were relatively more persons under 25 among the females than among the males. This difference between the sexes is brought out even more clearly by the ratios of males to females. In the age group 25 to 44 there were, in 1910, 110.2 males to 100 females, and in the age group 45 to 64 the ratio was 114.4 to 100; but, while there was an excess of males also in each one of the three younger age groups and in the group 65 years and over, the ratio did not exceed 102.5 to 100 in any one of them.

This difference in age distribution as between the sexes in the total population, however, is not wholly attributable to the foreign born, as there are also considerable differences in the case of the native classes. Thus, according to the returns, 19.4 per cent of the native white males of native parentage in 1910 were from 15 to 24 years of age, while the corresponding percentage for the females was appreciably higher, 20.1. The proportions in the age group 25 to 44 were very nearly equal, being, however, slightly higher for males than for females—26.3 as compared with 26 per cent—and of the males 14.1 per cent were reported as 45 to 64 years of age, as compared with 13.2 per cent of the females. Nevertheless, a slightly larger proportion of the females than of the males was reported as 65 years of age and over. Starting with a moderate excess of males over females in the two age groups

under 15 years, the returns for the native whites of native parentage show a practical equality of the sexes in the group 15 to 24 years. In the group 25 to 44 years, however, a marked excess of males was reported, and in the group 45 to 64 years there were, according to the returns, no less than 111.1 males to 100 females, while in the highest age group the females were slightly in excess.

discussed in connection with the chapter on sex. It is obvious that the only possible explanations of the reported excess of males for all ages combined—other than that it conforms to the facts—are (1) more numerous omissions of females than of males in the enumeration, (2) more numerous duplications of males than of females, or (3) erroneous classification according to nativity and parentage, affecting the two sexes differently. The conclusion was reached in the previous discussion, however, that the excess of males could probably be only in small part attributed to errors such as are indicated, although errors of the third class probably have had an appreciable influence. It was noted, for example, that for the South Atlantic and for the East South Central divisions, in which the foreign-born white population and the native population of foreign or mixed parentage are so small that it would be impossible for any considerable numbers of males to be carried over into the large class of native whites of native parentage, the statistics show, nevertheless, a considerable excess of males over females among the native whites of native parentage.

¹ Totals include persons of unknown age.
² Ratio not shown, the number of females being less than 100.

Doubt has sometimes been expressed as to the correctness of the figures showing a considerable excess of males over females—104 to 100—in the total native white population of native parentage. The validity of the statistics showing this excess has already been

DISTRIBUTION BY AGE PERIODS AND SEX OF THE TOTAL POPULATION, AND OF EACH PRINCIPAL CLASS: 1910.

It is, however, decidedly improbable that an equality of the sexes among the native whites of native parentage in the age group 15 to 24 years, following an excess of males in the earlier ages, should in turn be followed by a decided excess of males in the age groups from 25 to 64 years, as appears in the returns for 1910. There can be little doubt that an excess of males would appear also in the age group 15 to 24 years were it not for understatement of ages on the part of women. Attention has already been called to the fact that among the native whites of native parentage, according to the census returns, there were more women of 15 to 24 years of age in 1910 than there were girls from 5 to 14 years of age in 1900—an entirely impossible condition. This apparent tendency to understate

ages on the part of women probably results in an exaggeration of the excess of males in the age groups from 25 to 64 years of age. It may be also that in these age groups the excess of males is further exaggerated in some measure by the erroneous classification of foreign-born whites and native whites of foreign or mixed parentage as native whites of native parentage, errors which would be more likely to occur in the case of persons of middle or old age than in the case of children and young adults.

The sex and age statistics for the native whites of foreign or mixed parentage show conditions similar in some respects to those shown for the native whites of native parentage. There is, however, according to the returns, an absolute excess of females, not only in the age group 15 to 24 years, but also in that 25 to 44 years, contrasted with a considerable excess of males in the age group 45 to 64 years. It is probable that these apparently abnormal conditions are attributable, at least in part, to understatement of ages by women and perhaps also to errors in classification by nativity and parentage.

The age distribution of the males and females among the negroes, as reported, presents an even more peculiar condition. According to the returns there was in 1910 a decided excess of females in all four of the age groups under 45 years, the excess, however, being much greater in the age group 15 to 24 years than in the others. In sharp contrast, a great excess of males was reported in the age group 45 to 64 years and a considerable excess was reported in the age group 65 years and over, although it may be noted that in the ages above 80 the females were returned as decidedly in excess (see Table 19, p. 303).

There is little probability that erroneous classification according to race appreciably affects these statistics for the negroes and they are scarcely affected by immigration, so that, so far as the relationships shown do not in fact exist, they must be attributable chiefly to errors in the statement of ages. There seems no doubt that the very great excess of females in the age group 15 to 24 years is largely attributable to understatements of age by women. The excess of males in the negro population as reported was particularly great in the several 5-year age groups from 50 to 70 years, the ratio of males to females in each of these groups exceeding 118 to 100—being in the group 50 to 54 years 122.3 to 100. That misstatements of age by males enter into these figures is evident from the fact that more negro men were reported as 50 to 54 years of age in 1910 than were reported as 40 to 44 years of age in 1900—a condition which, in the almost complete absence of negro immigration, is entirely impossible.

For the foreign-born whites the age distribution of the males is decidedly different from that of the females—the males being greatly in excess in the ages

15 to 64 years. In the age group 25 to 44 years there were in 1910, according to the returns, no less than 141.3 males to 100 females.

The Indians show an excess of males in each age group up to 65 years, the excess being greatest in the group 45 to 64 years. There is naturally an extraordinary difference between the two sexes with respect to age distribution in the case of the Chinese, Japanese, and "all other" population, due to the effects of disparity between the sexes in the immigrants of these classes.

The probable errors in the statistics with reference to the age distribution of the two sexes are by no means confined to the returns of the census of 1910. Prior censuses also showed conspicuous disparities between the sexes with respect to age distribution, some of which at least can apparently be attributed only to error. For comparison, Table 25 is presented, which shows, according to the returns of the last three censuses, the ratio of males to females for the native whites of native parentage, the native whites of foreign or mixed parentage, and the negroes in each of the six age groups specified in Table 24. The figures for 1890 regarding negroes are not available in the case of some of these age groups.

CLASS OF POPULATION AND AGE PERIOD.	MALES TO 100 FEMALES.

65 years and over	107.7	103.7	102.8

¹ Figures not available.

It is not necessary to discuss in detail the distribution of the sexes according to quinquennial age periods. Tables 19, 20, 21, and 22, already presented, show the absolute numbers as reported at the census of 1910, and the corresponding percentages of distribution. For convenience in interpreting these statistics, Table 26 is given, which shows the ratio of males to females in each 5-year age group according to the returns for the population as a whole and for the leading classes.

Comparative statistics for earlier censuses regarding the age distribution of the sexes are presented in Table 33 (pp. 322 to 325) and Table 34 (p. 326).

95 to 99 years.....	70.1	68.6	61.1	(1)	(1)	80.2	71.1	(1)		
100 years and over.....	63.4	74.4	69.5	(1)	(1)	75.4	60.1	(1)		

¹ Ratio not shown, the number of females being less than 100.

Median age.—The median age is that age which divides the population into two equal groups, one-half being older and one-half younger than the median age. Table 27 shows the median age for each important class of the population in 1910.

Table 27 MEDIAN AGE OF THE POPULATION OF KNOWN AGES:

CLASS OF POPULATION.	1910		
	Total.	Male.	Female.
All classes.....	24.0	24.6	23.5
White.....	24.4	24.9	23.9
Native white.....	21.4	21.5	21.3
Native parentage.....	21.9	22.1	21.7
Foreign or mixed parentage.....	20.0	19.9	20.2
Foreign-born white.....	37.1	36.7	37.6
Negro.....	20.8	21.1	20.6
Indian.....	19.1	19.2	19.0

The median age for the total population in 1910 was 24 years, for the males 24.6, and for the females 23.5. The principal reason for the higher median age of males is found in the fact that in the foreign-born population, which has a high median age, the males greatly outnumber the females. Among the native whites of native parentage, the negroes, and the Indians, however, the median age of the males exceeded that of the females. Among the native whites of foreign or mixed parentage and the foreign-born whites the median age of the females was higher than that of the males. The median age of the negroes was slightly lower than that of the native whites. It is natural, in view of the increase in immigration, that the median age of the native whites of foreign or mixed parentage should be lower than that of the native whites of native parentage. The median age of the Indians was lower than that of any other class of the population.

In Table 28 are shown the median ages of the total population and of the white and the colored, so far as available, for the censuses from 1790 to 1910.

Table 28 MEDIAN AGE OF THE POPULATION OF KNOWN AGES.¹

CENSUS YEAR.	All classes.

1810.....	16.0	15.9	16.1
1800.....	16.0	15.7	16.3
1790.....	15.9

¹ Before 1880 the ages of the population were not given by single years. In 1790 the ages of only the free white male population were obtained, and in only two groups—under 16 and over 16. At successive censuses new details were added to the age classification, and since 1830 the ages of that part of the population in which the median age falls have been tabulated in quinquennial groups. For the censuses before 1880 it has been assumed for the purpose of computing the median age that the proportions of the population at the single years within the groups were as in 1900. For the colored population the returns of the negro population in 1900 have been used as a standard, no other classes having been counted as "Colored" before 1870.

² Under "Colored" in 1910 are included also "other Asiatics" first enumerated separately in 1910. For censuses prior to that of 1870 "Colored" embraces few if any colored other than negroes.

The median age of the total population has increased from 16.7 years in 1820 to 24 years in 1910. This increase has been uninterrupted, and has been more rapid during the last two decades than during any previous decade. For the white population the increase in the median age has been from 16 years in 1800 and in 1810 to 24.4 years in 1910. In 1820 the median age of the negroes (who constitute the total colored for 1820) was higher than that of the whites, while in 1910 the median age of the whites was 3.4 years greater than that of the total colored, and (see Table 27, opposite) 3.6 years greater than that of the negroes.

Detailed tables for the United States as a whole.—The following tables present details regarding the age distribution of the population of the United States as a whole. Table 29 shows for the total population and for the principal classes, by sex, the number reported in 1910 for each individual year of age; and Table 30 gives percentages based on these numbers. Table 31 presents statistics by cumulative age groups for 1910. Table 32 presents statistics for cumulative age groups (the same as those in Table 31) for the population as a whole and for each of the principal classes, as reported at the censuses of 1910, 1900, and 1890, percentages being given as well as absolute numbers. Table 33 presents statistics by 5-year age groups for the total population, the native whites, the foreign-born whites, and the colored population (negroes, Indians, Chinese, Japanese, and "all other"), for the four censuses from 1880 to 1910, with corresponding percentages. Table 34 presents statistics for 1910, 1900, and 1890 for the native whites of native parentage, the native whites of foreign or mixed parentage, and the negroes (the figures for certain age groups in the case of the negroes not being available for 1890).

DIVISIONS AND STATES.

Causes of differences in age distribution.—Very considerable differences exist among the nine geographic divisions of the country and among the individual states with respect to the age distribution of the total population and also with respect to the age distribution of specific classes of the population. The differences with respect to the total population are in part attributable to differences with respect to its composition according to color or race, nativity, and parentage. Thus a large proportion foreign born tends to produce a relatively high proportion of adults in the total population. Again, among the negroes there are relatively more in the younger and fewer in the older ages than among the native whites of native parentage, so that the presence of large numbers of negroes in a division or state affects correspondingly the distribution of the total population according to age.

Various factors cause the differences among divisions or states with regard to the age distribution of a given class in the population. Thus the age distribution of the several native classes is affected by differences in birth rates and in death rates, and by differences with respect to changes in these rates from one time to another. Again, interstate migration has a great influence upon age distribution. Among migrants, adults, and particularly the younger adults, are relatively much more numerous than in the total population. A division or state which has lost extensively through interstate migration is likely to have a smaller proportion of persons in the younger and middle ages of adult life in its native population than one which has gained by such migration. The distribution of ages in the urban population is usually decidedly different from that in the rural population—partly by reason of migration from country to city—and consequently the age distribution of the total population of a given class in a state or division is much affected by the proportions urban and rural. Finally, the age distribution of the foreign born and of the natives of foreign or mixed parentage in any given state or section of the country depends in considerable measure upon the period of time at which immigration to that state or section has chiefly occurred.

Total population according to broad age groups, by divisions: 1910.—Table 35 and the accompanying diagram show, by percentages, the distribution according to broad age groups of the total population of each geographic division in 1910. The absolute numbers appear in Table 36.

The proportion of children and young persons was smallest in the New England and Pacific divisions—the farthest east and the farthest west. The proportion in the prime of life—25 to 44—was highest in the Pacific division. The proportion 45 to 64 was highest in New England, almost as high in the Pacific division, but considerably lower in the other divisions.

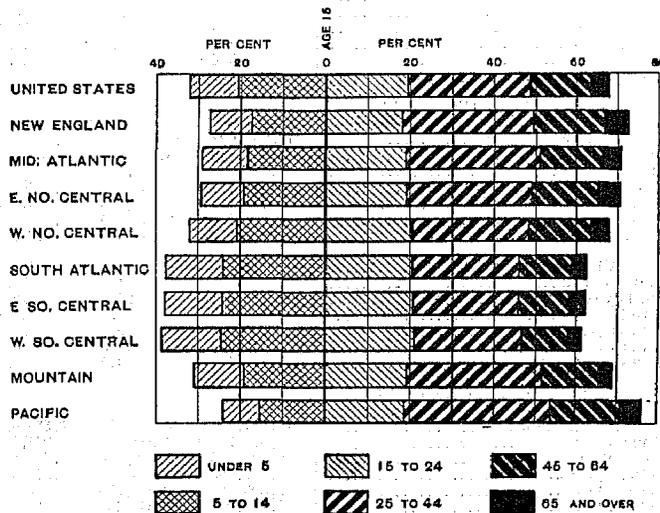

The proportion of old people, 65 and over, was highest in New England. In the Pacific division the effect of interstate migration upon the age distribution of the population was very marked. Next to these two divisions in respect to the smallness of the proportion of children and young persons ranked the Middle Atlantic and East North Central divisions, which also showed high proportions urban and foreign born.

¹ Includes persons of unknown age.

DISTRIBUTION BY AGE PERIODS OF TOTAL POPULATION, BY DIVISIONS: 1910.

The three southern divisions, as compared with the rest of the United States, had very high proportions in the age groups below 25 years, and more especially below 15, and correspondingly low proportions in the age groups 25 and over. In the West South Central division, for instance, 59.4 per cent of the population were under 25 years of age, as compared with 45.5 per cent in New England and 42.9 per cent in the Pacific division. The fact that there are many negroes and few foreign-born persons in the South has been at least partly responsible for the age distribution in that section.

Principal classes of the population according to broad age groups, by divisions: 1910 and 1900.—Table 36 shows, by geographic divisions, in absolute numbers and percentages, the distribution of each principal class of the population, according to broad age groups, in 1910 and 1900.

DISTRIBUTION BY BROAD AGE PERIODS OF THE POPULATION, BY DIVISIONS: 1910 AND 1900.

New England is the only division in which less than 10 per cent of the native whites of native parentage in 1910 were under 5 years of age. In fact, for each of the three age groups under 25 years the proportion was lower in New England than in any other division. On the other hand, the proportion from 25 to 44 years old for this class was higher in New England than in any other division except the Middle Atlantic, Mountain, and Pacific divisions, and the proportions in the two groups 45 years of age and over were higher than in any other division, the excess being particularly noticeable in the age group 65 years and over. It is not improb-

able that this is indicative of a low or declining birth-rate in this class of the population in New England.

The Pacific division offers the only case in which the number of native whites of native parentage from 5 to 14 years old was smaller than the number from 15 to 24 years old. This peculiar age distribution must be caused by the migration from other sections of the country of natives in the years of early manhood and womanhood. The Pacific division also had, largely as a result of migration, a larger proportion of this class of population in the ages from 25 to 44 than any other division.

It is noteworthy that among the native whites of native parentage there were relatively more children and relatively fewer persons in the prime of life and at older ages in the southern divisions than there are in the northern. This would seem to indicate that the birth rate is higher in the South than it is in the North or has shown less decline in the South.

The most conspicuous contrast is that between the New England division and the West South Central. In the former in 1910 only 9.6 per cent of the native whites of native parentage were children under 5 years of age, while 29.2 per cent were 45 years of age and over; in the latter the corresponding percentages were 15.2 and 13.5.

Among the native whites of foreign or mixed parentage the proportion of children under 15 years of age was highest in New England and next highest in the Middle Atlantic division, this condition being due to the fact that these divisions have recently received very large numbers of immigrants from foreign countries. The smallest proportion of children in this class was found in the East South Central division. The foreign immigration to this division—never large—has apparently fallen off in recent years, this being the only division in which the number of foreign-born whites was smaller in 1910 than in 1900. The effect of this is shown in a decline in the proportion of children under 15 among the native whites of foreign or mixed parentage, the proportion being 22 per cent in 1910 as compared with 27.8 per cent in 1900. Interstate migration also affects the age distribution of this group, as well as that of the native whites of native parentage, though to a less extent.

For the same reason which accounts for the peculiar age distribution of its native whites of foreign or mixed parentage, the East South Central division shows an age distribution of the foreign-born whites different from that found in other divisions, markedly different from that found in the New England and Middle Atlantic divisions. Of the foreign-born whites in this division the number from 25 to 44 years of age was only slightly greater than that from 45 to 64 years, while in New England and in the Middle Atlantic division the number from 25 to 44 was over twice as great as that from 45 to 64. The age distribution of this class in the other southern divisions, as well as in the West North Central division, approximates to that in the East South Central, while in the East North Central, Mountain, and Pacific divisions, which have received considerable immigration during recent years, the distribution is more similar to that in the two northeastern divisions.

Among the negroes the proportion in the early age groups was higher in the three southern divisions, where most of the negroes are found, than in the other sections of the country. This is the result of migration of adults from the South to the North and the West.

Comparative statistics for the total population, by divisions: 1890-1910.—Table 37, page 331, shows, by geographic divisions as well as by states, the percentage distribution of the total population in 1910, 1900, and 1890, according to broad age groups. It will be seen that in most geographic divisions the changes from one census to another have been in the same general direction as those in the United States as a whole. Thus in every geographic division the proportion under 5 years of age was lower in 1910 than in 1900. The proportion in 1910 was also lower than that in 1890 in all the geographic divisions except New England, where it was higher, and the South Atlantic division, where there was no change. In every division, without exception, persons from 5 to 14 years of age constituted a smaller proportion of the total population in 1910 than in either 1900 or 1890. On the other hand, in every division the proportion from 45 to 64 years of age was higher in 1910 than at either of the two preceding censuses, and in all except three divisions the proportion 65 years and over also was higher, the exceptions being New England, where the proportion in 1910 was the same as in 1900 and lower than in 1890, the Middle Atlantic division, where the proportion was somewhat lower in 1910 than at either of the two preceding censuses, and the Pacific division, where the proportion in 1910 was the same as that in 1900, although higher than that in 1890.

Statistics for individual states.—Table 37 gives percentages with respect to the age distribution of the total population of each state for 1910, 1900, and 1890 (for absolute numbers for 1910 and 1900 see Table 43, pp. 352 to 409). This table shows much more marked differences among the states than appear among the geographic divisions, but most of the differences can be attributed to causes similar to those which have already been mentioned as explaining the conditions in the several divisions.

The age distribution for any given state is determined in part by the composition of the population as regards color or race, nativity, and parentage, and in part by other conditions which are generally characteristic of the section of the country in which the state is located. Naturally, therefore, the differences between states correspond in a general way to those differences between sections of the United States which have been brought out in the discussion of the age distribution of the geographic divisions.

Wisconsin shows a somewhat different age distribution among the native whites of native parentage from the other states in the East North Central division, resembling in this respect rather Minnesota and the Dakotas. (See Table 42.) In Wisconsin, in 1910, 18.5 per cent of this class of the population consisted of children under 5 and only 3.4 per cent of persons 65 years of age and over, while in no other state of the division was the proportion of children under 5 higher than 13.5 per cent or the proportion of persons of 65 years and over lower than 4.4 per cent.

AGE DISTRIBUTION.

Again, the state of Utah shows among the native whites of native parentage an age distribution decidedly different from that of other states in the Mountain division; and Nevada departs considerably from the other states, but in the opposite direction. In Utah in 1910 no less than 52.4 per cent of the native white population of native parentage consisted of children under 15 years of age, while in no other state of the division did the proportion exceed 40 per cent. In Nevada the children formed a much lower percentage of this class of the population than in any of the other states of the division.

With respect to the native whites of foreign or mixed parentage and the foreign-born whites there are a considerable number of cases in which individual states show an age distribution differing considerably from that in other states of the same division, these differences being attributable primarily to differences with respect to the periods of time at which immigration has chiefly occurred.

With respect to the negroes, the more northerly states of the South Atlantic division—Delaware, Maryland, and West Virginia, and in a more marked degree the District of Columbia—show a smaller proportion of children than the states farther south with a larger negro population.

In all but 11 states persons from 25 to 44 years of age constituted a larger proportion of the total population in 1910 than in 1890. Three of the states which constitute exceptions are in the West North Central division, one in the West South Central, six in the Mountain, and one in the Pacific division, all of them being states of comparatively recent settlement, which prior to 1890 had received relatively large numbers of migrants in the active ages from other states or from abroad. None of the states in New England or the Middle Atlantic division, with the exception of Maine, showed an advance between 1890 and 1910 in the proportion 65 years of age and over, while, on the other hand, in every other state of the country except North Carolina, South Carolina, and Utah the proportion in this age group was higher in 1910 than in 1890.

Detailed tables, by divisions and states.—The detailed tables giving the age distribution of the population by geographic divisions and states are so extensive that they are placed at the end of this chapter, after the text discussion of the age distribution in urban and rural communities.

Table 41 (pp. 336 to 343) shows, in absolute numbers, by divisions and states, the age composition of the total population and of the four principal classes of the population in 1910 and in 1900, according to 11 age groups, the age periods being quinquennial up to 34 years and decennial from 35 to 64 years, all persons of 65 and over being included in one group.

Table 42 (pp. 344 to 351) gives percentages based on the numbers in Table 41, the percentages being shown not only for the 11 age groups mentioned but also for the 6 broad age groups distinguished in various tables already presented.

Table 43 (pp. 352 to 409) presents detailed statistics for 1910 by divisions and states. It gives the absolute numbers for 5-year age groups for all ages and percentages for the same age groups up to 64 years of age; for the more advanced ages the percentages are given for 10-year periods. It also shows the single years for the ages from 0 to 24 years. The statistics cover the total population and each of the principal classes, sex being distinguished in each case. For the total population, without distinction by sex, comparative figures are given for 1900. Each state or division occupies a single page. The divisions are arranged geographically, but for convenience in reference the states are arranged alphabetically.

Table 44 (pp. 410 to 412) is in the nature of a supplement to the preceding table and presents statistics for the Indians, Chinese, and Japanese, separately, for each state where these classes constitute an important element of the population.

URBAN AND RURAL COMMUNITIES.

United States as a whole: 1910.—Urban and rural communities differ greatly with respect to the age distribution not only of the total population but also of particular classes of the population. The causes of these differences are substantially the same as those which bring about differences in age distribution among states or geographic divisions. Table 38 gives statistics for the total population of the urban and rural communities of the United States as a whole in 1910. Here as elsewhere in this report all incorporated places of 2,500 inhabitants or more, including New England towns of that size, are classified as urban.

¹ Includes persons of unknown age.

The absolute numbers presented in this table are quite as significant as the percentages. In the United States as a whole there were many more persons in each of the age groups comprising persons under 20 years of age in the rural communities than in the urban communities, but in each of the age groups comprising persons from 20 to 54 years of age, which embrace the most active period of life, there were more persons in urban than in rural communities. On the other hand, the rural communities contained more

persons in advanced middle life and old age. The urban communities contained in 1910 considerably less than half (46.3 per cent) of the total population of the country, of all ages, but they contained over half (51.8 per cent) of the persons between 20 and 54 years of age. There were 22,925,133 persons between 20 and 54 in urban communities, as compared with 21,311,714 in rural communities. Such persons constituted 53.8 per cent of the total urban population, but only 43.2 per cent of the rural.

The very great differences between urban and rural communities with respect to the age distribution of the total population are in part attributable to differences in the color or race, nativity, and parentage composition of the population, but there are also very considerable differences with respect to the age distribution of persons of a given class. Table 39 gives statistics for the principal classes of the population in urban and rural communities in the United States as a whole by broad age groups.

¹ Includes persons of unknown age.

Among the native whites of native parentage the proportion of children under 15 years of age was materially lower in the urban than in the rural population. The proportion from 15 to 24 years of age was slightly higher in the urban communities, and the proportion from 25 to 44 years very materially higher—29.9 per cent of the native whites of native parentage in urban communities being in this age group as compared with 24.1 per cent of those in rural districts. The proportion 45 to 64 years of age, also, was slightly higher in the urban than in the rural population, but the proportion 65 years of age and over was lower. The opportunities to be found in the cities have attracted large numbers of persons in the more active ages. It is impossible to draw any conclusions as to the relative fecundity or the relative longevity of the native whites of native parentage in the two classes of communities from these statistics because of the effect of migration on the age distribution.

The age distribution of the native whites of foreign or mixed parentage in urban and in rural areas, respectively, has been greatly affected by the period of largest immigration of foreigners into these areas. Most of the recent immigration has gone to cities. A larger proportion of the earlier immigration went to rural districts. In consequence of the relatively more rapid increase of the foreign-born element in the urban population during recent years—as compared with the increase in rural communities—the proportion of chil-

dren under 5 years of age of foreign or mixed parentage has become greater in the urban than it is in the rural communities. For the age group 5 to 14 years, however, the proportion was slightly larger in the rural districts. The proportion in the two groups covering the ages 15 and 44 years was somewhat larger in the urban districts, perhaps as the result of migration from country to city, while the proportion 45 years of age and over was considerably larger in the rural than in the urban districts.

The age distribution of the foreign-born white in the two classes of communities also is affected by the fact that immigration has in recent years gone largely to cities. Thus 42.3 per cent of the foreign-born whites in the rural districts in 1910 were 45 years of age or over, as compared with only 31.2 per cent of those living in cities.

Among the negroes the proportion of children under 15 years of age in 1910 was considerably higher, and that of persons over 65 slightly higher, in the rural districts than in the cities, while the proportion from 25 to 44 years of age was very much higher, and that from 45 to 64 years of age considerably higher, in the urban than in the rural communities. These figures indicate that there has been considerable migration of negroes in the active age groups from country to city; it is quite probable also that differences in birth rates and death rates affect materially the age distribution.

Table 40 shows, by percentages, the distribution of the males and females in urban and rural districts, respectively, according to broad age groups, as reported at the census of 1910, and also the number of males to 100 females in each age group. While in all probability, as already stated, there is a certain margin of error in the statistics of age by sex, these figures undoubtedly bring out substantially the true differences between urban and rural communities. The absolute numbers on which the percentages are based will be found in Table 46, pages 425 to 428.

It will be seen from Table 40 that the age distribution of males and that of females in the urban districts are somewhat similar, and that the same is true for the two sexes in the rural districts. The age distribution of the males in urban communities is more similar to that of the females in the same communities than it is to that of the males in the rural districts. There are, however, appreciable differences between urban communities and rural communities with respect to the ratio of males to females in the several age groups. In the rural population the males in 1910 outnumbered the females at all ages, the ratio increasing gradually from one age group to another until the maximum was reached (124.2 males to 100 females) in the age group 45 to 64. In the urban population, however, according to the returns, the females outnumbered the males in the two age groups from 5 to 24 years, as well as in the age group 65 years and over; and in each of the six age groups the ratio of males to females was lower in the urban than in the rural communities. The very marked disparity between the two classes of communities with respect to the age groups above 24 years is doubtless attributable largely to the fact that there are more opportunities for the employment of women in urban than in rural communities.

It should be noted that females, particularly in the adult ages, form a larger proportion of the population in urban than in rural communities notwithstanding that foreign-born whites—a class in which, as previously stated, males are greatly in the majority—are largely concentrated in cities.

Geographic divisions and states.—The differences which have been noted with regard to the age distribution of the several classes of the population as between urban and rural communities are due to some extent to differences in geographic distribution, the urban com-

munities being relatively much more important in certain sections of the country than in others. Where a given geographic division is considered, the differences in the age distribution for a given class of the population as between urban and rural communities are much less conspicuous. This may be seen from Table 45 (pp. 413 to 424), which presents, by geographic divisions and states, for 1910, statistics similar to those presented in Table 38 for the United States as a whole. It will be seen, for example, that in New England the differences in age distribution as between city and country are not nearly as great as in the United States as a whole.

There is, however, a very considerable degree of uniformity among the geographic divisions with respect to the relative age distribution in urban and in rural communities, the conditions usually being similar in kind, if not in degree, to those in the United States as a whole.

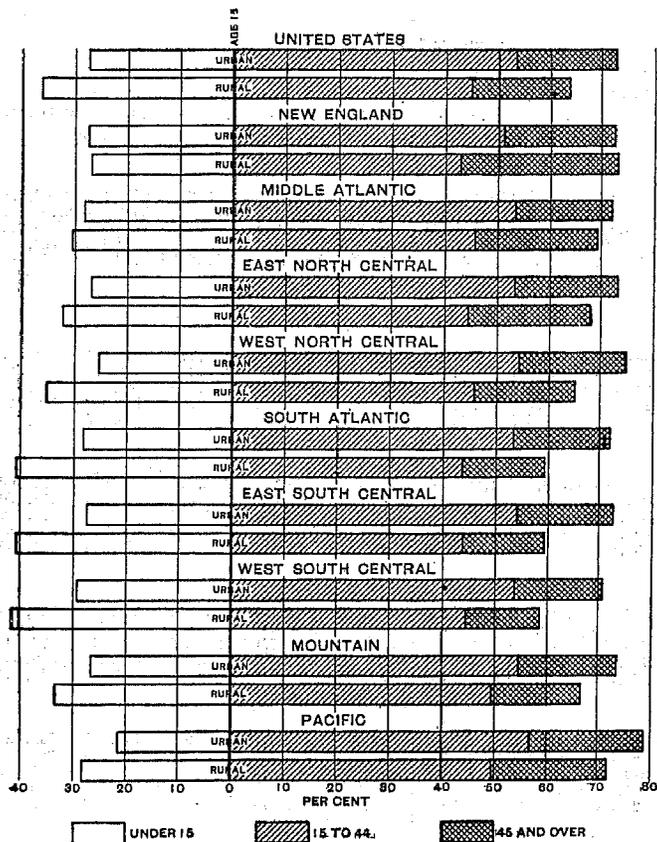

Thus among the native whites of native parentage the proportion under 5 years of age is lower in the urban than in the rural districts in all the geographic divisions except New England and the Middle Atlantic division. On the other hand, in every geographic division the proportion in the most active ages—those from 25 to 44 years—is higher in the urban than in the rural population of this class. The same statement holds true as to the persons from 45 to 64 years of age except in the New England, Middle Atlantic, and East North Central divisions, where the proportion is higher in the rural than in the urban population. Again, in most of the geographic divisions the proportion 65 years of age and over among native whites of native parentage is smaller in the urban than in the rural communities. The exceptions are found in the West South Central and Mountain divisions, in both of which the rural population has recently received large accessions of persons in the more active ages by migration from other parts of the country.

The diagram on the next page shows graphically the distribution by broader age periods of the urban and rural population of each geographic division in 1910.

In all the geographic divisions except the New England, Middle Atlantic, and East North Central divisions the proportion of children under 5 among the native whites of foreign or mixed parentage is lower in the urban than in the rural communities, while in each division except the East North Central the proportion between 25 and 44 years of age is higher in the urban than in the rural. On the other hand, in each division except the West North Central and West South Central the proportion 65 years of age and over in this class is lower in the urban than in the rural districts.

In three divisions—the Middle Atlantic, the South Atlantic, and the Mountain—the proportion from 25 to 44 years of age among the foreign-born whites is greater in the rural than in the urban districts, but elsewhere the opposite is the case. The proportion over 65 years old is greater in the rural than in the urban communities in all divisions except the South Atlantic, West South Central, and Mountain divisions.

DISTRIBUTION BY AGE PERIODS OF THE URBAN AND RURAL POPULATION, BY DIVISIONS: 1910.

Classes of cities: 1910.—Statistics for cities classified according to size, are shown by Table 47 (pp. 429 to 431), for the United States as a whole and for each geographic division. It may be noted that the figures for the country as a whole are of less significance than those for individual divisions, because of differences in the geographic distribution of cities of the different classes.

Comparative statistics: 1910, 1900, and 1890.—Statistics according to age were not presented for urban and rural communities separately at censuses prior to 1910, but statistics were compiled separately for each city of 25,000 inhabitants or more, so that it is possible to present a comparison for the three censuses between the cities and towns of less than 25,000 inhabitants and the rural districts combined on the one hand, and the cities of 25,000 inhabitants or more on the other hand. Such a comparison is presented for the total population and each of the principal classes of the population in Table 48, pages 432 to 436, in which table a distinction is also made between the cities of 25,000 to 100,000 inhabitants and those of more than 100,000 inhabitants. The statistics relate to the United States as a whole and to each of the nine geographic divisions.

Detailed tables, for urban and rural communities.—Table 45 (pp. 413 to 424) presents, by geographic divisions and states, age statistics for the urban and rural population in 1910. It distinguishes the 6 broad age

groups and relates not only to the total population but to each of the principal classes of the population, without, however, the distinction of sex.

Table 46 (pp. 425 to 428) presents, for the United States and each geographic division, but not by states, statistics similar to those in Table 45, with the added distinction of sex.

Table 47 (pp. 429 to 431) presents for 1910, for the United States as a whole and for each geographic division, the distribution by broad age groups of the total population and of the principal classes, for groups of cities classified according to size—cities of 2,500 to 25,000, from 25,000 to 100,000, from 100,000 to 500,000, and 500,000 and over.

Table 48 (pp. 432 to 436) presents comparative statistics for 1910, 1900, and 1890, for the United States as a whole and for each geographic division, showing the distribution by broad age groups of the population of cities under 25,000 and rural districts combined, of cities of 25,000 to 100,000 inhabitants as a group, and of cities of 100,000 and over as a group. The data relate to the total population and to the principal classes.

PRINCIPAL CITIES.

Detailed statistics as regards age for individual cities are presented in Tables 49 to 54.

Table 49 (pp. 437 to 449) presents detailed age statistics for each city of 500,000 inhabitants or more, the table being precisely similar in form to Table 43, for states.

Table 50 (pp. 450 to 463) presents for 1910 detailed age statistics for individual cities of 100,000 to 500,000 inhabitants. It is similar to Table 49, except that percentages are not given and that the individual years of age from 5 to 24 are not shown, although those from 0 to 4, inclusive, are distinguished.

Table 51 (pp. 464 to 468) shows for 1910 the distribution by broad age groups of the total population and of the principal classes, without distinction by sex, in each city of 100,000 inhabitants or more.

Table 52 (pp. 469 to 471) shows for 1910 the distribution by broad age groups of the total population, without distinction of class or sex, of each city of 25,000 to 100,000 inhabitants.

Table 53 (pp. 472 to 488) presents for 1910 age statistics according to 10 age groups for each city of 25,000 inhabitants or more, absolute numbers only being given. The table distinguishes the total, native white, foreign-born white, and negro population, by sex.

Table 54 (pp. 489 to 506) presents more condensed age statistics, for 1910, for each city of 10,000 to 25,000 inhabitants. The age grouping in this table is different from that in any other, the classes being as follows: Under 1 year; under 5 years; 5 to 9 years; 10 to 19 years; 20 to 44 years; and 45 years and over. The table relates to the total population and to the native white, foreign-born white, and negro population, classified by sex; it contains no percentages.

POPULATION.
