

# 1950 CENSUS OF HOUSING

## PRELIMINARY REPORTS

FOR RELEASE

April 13, 1951

Washington 25, D. C.

Series HC-4, No. 7

### HOUSING CHARACTERISTICS OF NEW YORK: APRIL 1, 1950

(The reports in this series are numbered in alphabetical order according to the names of the States. The number of the report, therefore, does not indicate the sequence of publication. Reports will be issued in this series for the 10 States with the largest population in 1940, followed by Hawaii and Puerto Rico)

Home ownership is substantially greater in the State of New York, the average size of household is about the same, and the average dwelling unit contains fewer rooms than 10 years ago, according to preliminary sample data from the 1950 Census of Housing.

The number of dwelling units in the State increased faster than population in the past decade. The total number of dwelling units is approximately 4,621,000, about 15 percent more than in 1940. For the same period, population in dwelling units gained 9 percent.

About two-fifths of the total occupied dwelling units are owner-occupied. Although renters greatly exceed owners, there has been a substantial increase in home ownership since 1940. Homes occupied by their owners increased by 42 percent, in contrast to the net increase of about one percent in the number occupied by renters.

The average household consists of about the same number of persons, the median being

3.1 in 1950 and 3.2 in 1940. However, the average dwelling unit contains fewer rooms, a median of 4.5 rooms in 1950 compared with 4.8 in 1940.

Approximately 5 out of 6 dwelling units have hot running water, are equipped with a private bath and flush toilet, and are not dilapidated.

For nonfarm rental homes, the median monthly rent is \$40. The median value of nonfarm 1-dwelling-unit owner homes is \$8,900.

Figures on these and other housing characteristics in the State were released today by Roy V. Peel, Director, Bureau of the Census, Department of Commerce.

Because the 1950 data in this report are based on a sample, the results are subject to sampling variability as explained in the section "Reliability of 1950 estimates." It can be seen from the tables in that section that the smaller figures should be interpreted with particular care, as should also small differences between figures.

Table 1.--OCCUPANCY CHARACTERISTICS OF DWELLING UNITS, FOR NEW YORK, URBAN AND RURAL: 1950

Subject	Total		Urban		Rural	
	Number	Percent	Number	Percent	Number	Percent
<b>OCCUPANCY</b>						
All dwelling units.....	4,621,000	100.0	3,792,000	100.0	829,000	100.0
Occupied dwelling units.....	4,148,000	89.8	3,589,000	94.6	559,000	67.4
Owner occupied.....	1,579,000	34.2	1,159,000	30.6	420,000	50.7
Renter occupied.....	2,569,000	55.6	2,430,000	64.1	138,000	16.6
Vacant dwelling units.....	473,000	10.2	203,000	5.4	270,000	32.6
Nonseasonal not dilapidated, for rent or sale.....	102,000	2.2	87,000	2.3	15,000	1.8
<b>POPULATION</b>						
Population in dwelling units.....	14,127,000	-	12,035,000	-	2,092,000	-
Population per occupied dwelling unit...	3.4	-	3.4	-	3.7	-

PRELIMINARY

Inventory.--The total number of dwelling units in New York in April 1950 was approximately 4,621,000, an increase of 589,000, or about 15 percent, over the 4,032,000 dwelling units in 1940. Most of the increase was the result of new construction; however, a substantial number were the result of conversions which increased the number of dwelling units in existing structures.

New York is largely urban. Dwelling units in urban areas amounted to 3,792,000, or about five-sixths of the total. The remaining 829,000 units were located in rural areas.

The preliminary data indicate a gross vacancy rate of 10.2 percent, or a total of 473,000 vacant units. Although this number is large, an analysis of the types of vacancies indicates that the available vacancy rate was relatively very small, 2.2 percent of the total dwelling units. An available vacant unit is one which is nonseasonal, not dilapidated, and offered for rent or sale. Over four-fifths of the remaining vacancies were for seasonal occupancy and one-fifth were nonseasonal vacant units which were either held off the rental or sale market or were dilapidated.

Tenure.--One of the most significant developments since 1940 is the substantial increase in home ownership. The gain resulted not only from new construction but also from the sale of existing rental homes for owner occupancy. There were 1,579,000 owner-occupied units, or 38 percent of the total occupied dwelling units in 1950, compared with 1,111,000, or 30 percent in 1940. The percentage of home ownership in 1950 was below the figure for the United States as a whole, which was 55 percent of all occupied dwelling units.<sup>1</sup>

The extent of home ownership in the State was more than twice as great in the rural areas as in the urban areas. Among occupied dwelling units, 75 percent in rural areas were owner-occupied as compared with 32 percent in urban areas.

Type of structure.--About one-third of the dwelling units in the State were in 1-dwelling-unit detached structures without business. In urban areas, over one-fifth were in 1-dwelling-unit detached structures while more than two-fifths were in multi-unit structures containing 5 or more dwelling units. In rural areas, about four-fifths of the units were in 1-dwelling-unit detached structures.

Rooms and persons.--The trend toward building smaller homes and the effect of converting large units into smaller units are reflected in the decrease in the size of dwelling units since 1940. The median dropped from 4.8 rooms in 1940

to 4.5 rooms in 1950. The 1- and 2-room units constituted 9 percent of the total dwelling units in 1950 and 7 percent in 1940; however, units with 6 rooms or more constituted 33 percent in 1950 and 38 percent in 1940.

On the average, rural units in 1950 were considerably larger than urban units. The median number of rooms for rural units was 5.4 rooms compared with the median of 4.4 rooms for urban units.

Households were about the same size in 1950 as in 1940. The median number of persons in a household was 3.1 in 1950 and 3.2 in 1940. Approximately half the units in 1950 contained 2 or 3 persons. The percent distribution of persons in dwelling units in New York was about the same as the distribution for the entire United States.

There was a faster growth of households than of population during the last 10 years; the number of households in the State increased by 13 percent, whereas the population in households increased by 9 percent.

To a great extent, the increase in households reflects the large number of marriages during the decade. At the same time, there has been no important change in the sharing of homes since 1940. The number of married couples who did not have their own households but were sharing the homes of others amounted to 277,000, or 8 percent of the total married couples in 1950, compared with 208,000, or 7 percent, in 1940.

Condition and plumbing facilities.--About 5 out of 6 dwelling units had hot running water, were equipped with a private bath and private flush toilet in the structure, and were not dilapidated. The comparable ratio for the whole United States was a little lower, approximately 4 out of 6. The proportion was seven-eighths for the urban dwelling units in the State but only five-eighths for rural units.

Rent.--The rent level in New York was above the average for the Nation. The median monthly rent for nonfarm rental units was \$40 compared with \$35 for all of the United States. Although one-fourth of the rental units in the State were renting for less than \$30, one-fifth were renting for \$60 or more. Rental units include renter-occupied dwelling units and nonseasonal vacant units which were offered for rent and were not dilapidated.

Value.--The median price which nonfarm home owners estimated their properties would sell for was \$8,900, about one-fifth higher than the comparable median for the United States as a whole, which was \$7,400. About one-sixth were estimated to sell for less than \$5,000; another one-sixth were estimated at \$15,000 or more. These properties include 1-dwelling-unit owner-occupied structures and 1-dwelling-unit nonseasonal vacant structures which were for sale and were not dilapidated.

## DEFINITIONS AND EXPLANATIONS

The tables in the report show the results of the 1950 Census of Housing based on a preliminary sample of dwelling units. Data from the 1940 Census are also shown if the items are comparable and if the 1940 data for such items were tabulated. Differences in definitions and procedures used in the 1950 and 1940 Censuses are explained below for each of the items.

Changes from the 1940 concepts were made, after consultation with users of census data, in order to improve the statistics, even though it was recognized that comparability would be adversely affected. When it has been feasible to do so, measures of the impact of the change on the statistics have been, or are being, developed.

Urban and rural areas.--According to the new definition adopted for the 1950 Census, urban areas comprise (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, towns,<sup>2</sup> and villages; (b) the densely settled urban fringe, including both incorporated and unincorporated areas, around cities of 50,000 or more; and (c) unincorporated places of 2,500 inhabitants or more outside any urban fringe. The remaining areas are classified as rural.

According to the old definition, urban areas comprised all places of 2,500 inhabitants or more which are incorporated places and areas (usually minor civil divisions) classified as urban under special rules relating to population size and density.

Farm and nonfarm residence.--In rural areas, dwelling units are subdivided into rural-farm units, which comprise all dwelling units on farms, and rural-nonfarm units which comprise the remaining rural units. However, the method of determining farm and nonfarm residence in the 1950 Census differs somewhat from that used in earlier censuses. In the 1950 Census, dwelling units on farms for which cash rent was paid for the house and yard only were classified as nonfarm. Furthermore, dwelling units on institutional grounds and in summer camps and tourist courts were classified as nonfarm.

Dwelling unit.--In general, a dwelling unit is a group of rooms or a single room, occupied or intended for occupancy as separate living

quarters, by a family or other group of persons living together or by a person living alone.

A group of rooms, occupied or intended for occupancy as separate living quarters, is a dwelling unit if it has separate cooking equipment or a separate entrance. A single room, occupied or intended for occupancy as separate living quarters, is a dwelling unit if it has separate cooking equipment, or if it constitutes the only living quarters in the structure. Also, each apartment in a regular apartment house is a dwelling unit even though it may not have separate cooking equipment. Excluded from the dwelling unit count are rooming house quarters which do not meet the above qualifications, and living quarters in such structures as institutions, dormitories, and transient hotels and tourist courts.

In the 1940 Census, a dwelling unit was defined as the living quarters occupied or intended for occupancy by one household. A household consisted of a family or other group of persons living together with common housekeeping arrangements, or by a person living entirely alone.

The number of dwelling units, as shown in this report, may be regarded as comparable with the number of dwelling units shown in the reports of the 1940 Census. The instructions used for identifying a dwelling unit in the 1950 Census were more explicit than those used in the 1940 Census. As a result, some living quarters may have been classified as separate dwelling units in the one census and not in the other. However, the net effect of the change in the instructions is probably small.

Data on occupied dwelling units and households.--A household consists of those persons who live in a dwelling unit, including not only family members, but also lodgers, servants, and other unrelated persons who live there. By definition, the number of occupied dwelling units is the same as the number of households. Small differences between these two numbers may appear in the population and housing reports, however, because the data for the reports were processed independently.

Population in dwelling units.--The population count shown in table 1 represents the population in living quarters which are defined as dwelling units. It excludes practically all of the population in such structures as rooming houses, institutions, dormitories, and transient hotels and tourist courts. The population in dwelling units is used in computing population per occupied dwelling unit; in the 1940 Census

<sup>2</sup> Except in New England, New York, and Wisconsin, where "towns" are minor civil divisions of counties and are not necessarily densely settled centers like the towns in other States.

Reports on Housing, the total population was used in the computation.

Vacant dwelling unit.--A dwelling unit is considered vacant if no persons are living in it at the time of enumeration. Vacant units are enumerated if they are intended for occupancy as living quarters regardless of their condition. New units not yet occupied are enumerated as vacant dwelling units if construction has proceeded to the extent that all the exterior windows and doors are installed and final usable floors are in place.

The classification "for rent" consists of vacant units offered for rent. The "for sale only" group is limited to those for sale only and not for rent. Vacant units which are not for rent or sale include units already rented or sold but not yet occupied, newly constructed units awaiting final completion and which have already been rented or sold, and units held off the market for other reasons.

The enumeration of vacant units in the 1950 Census of Housing is not entirely comparable with the procedure used in the 1940 Census. In 1940, vacant units were enumerated if they were habitable; vacant units which were uninhabitable and beyond repair were omitted from the enumeration. Vacant units for sale and vacant units for rent were enumerated as one combined category. The "for sale or rent" vacancies included all habitable vacant units which were available for occupancy even though not actually being offered for rent or sale at the time of enumeration, that is, all dwelling units which were vacant except those held for occupancy of an absent household.

In both censuses, dwelling units occupied entirely by nonresidents are included with vacant units not for rent or sale.

Vacant trailers, tents, houseboats, and railroad cars are excluded from the dwelling unit inventory in both 1950 and 1940.

Type of structure.--A separate structure has open space on all four sides or has vertical walls dividing it from all other structures. A "1-dwelling-unit detached" structure has open space on all four sides and contains only one dwelling unit.

The definitions of type of structure used in the 1950 Census of Housing are slightly different from those used in the 1940 Census. However, a direct comparison can be made between the 1950 and the 1940 data as they are presented in this report. The category "1-dwelling unit detached without business" of 1950 is comparable to the "1-family detached" of 1940. Units in the "Other 1- to 4-dwelling-unit" group of 1950

are comparable to the dwelling units in the combined 1940 count of "1-family attached," "2-family side-by-side," "2-family other," "3-family," "4-family," and "1- to 4-family with business." The classification of units in the larger structures, those with 5 or more dwelling units, is the same for both censuses.

Condition and plumbing facilities.--Data on condition of a dwelling unit are shown in combination with data for selected plumbing facilities and are, therefore, limited to units for which condition and all the plumbing items are reported. Plumbing facilities include water supply, toilet facilities, and bathing facilities.

A dwelling unit is reported with private toilet and bath if it has both a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. Running water and cold water refer to piped running water inside the structure. The "no running water" category refers to piped running water outside the structure and to other sources, such as a hand pump.

For the item on condition, dwelling units are classified as "not dilapidated" or "dilapidated." A dwelling unit is dilapidated when it has serious deficiencies, is rundown or neglected, or is of inadequate original construction, so that the dwelling unit does not provide adequate shelter or protection against the elements or it endangers the safety of the occupants. Dilapidated dwelling units are so classified either because of deterioration, as evidenced by the presence of one or more critical deficiencies or a combination of minor deficiencies, or because of inadequate original construction, such that they should be torn down, extensively repaired, or rebuilt.

In the 1940 Census, data on condition were collected showing dwelling units "needing major repairs." Dwelling units were classified as needing major repairs when such parts of the structure as floors, roof, plaster, walls, or foundation required repairs or replacements, the continued neglect of which would have seriously impaired the soundness of the structure and created a hazard to its safety as a place of residence.

Because the definitions of the two terms differ significantly, the 1940 count of dwelling units needing major repairs and the 1950 count of dilapidated dwelling units are not comparable.

Contract monthly rent.--Contract monthly rent is the rent contracted for by renters of nonfarm dwelling units at the time of enumeration. The rent is the amount contracted for regardless of whether it includes furniture,

heating fuel, electricity, cooking fuel, water, or other services sometimes supplied. Dwelling units which are occupied rent free are not included with the units reporting rent.

A similar definition was used in the 1940 Census except that an estimated monthly rent was reported and tabulated for the nonfarm units which were occupied rent free.

Monthly rent for vacant dwelling units is the amount asked for the dwelling unit at the time of enumeration, and is presented in 1950 for the nonseasonal not dilapidated vacant units for rent. The 1940 rent data for vacant dwelling units, however, applied to all vacant units classified as for sale or rent. Because the 1950 rent data in this report are combined for renter-occupied and selected vacant dwelling units, they are not comparable with the 1940 results.

Value.--Value data are shown for nonfarm owner-occupied dwelling units and vacant nonseasonal not dilapidated units which are for sale only. Value is shown only if the unit is in a one-dwelling-unit structure without business and if it is the only dwelling unit included in the property. The value represents the amount for which the owner estimates that the property, including such land as belongs with it, would sell under ordinary conditions and not at forced sale. For vacant units, it is the sale price asked by the owner.

Units for which value data were published from the 1940 Census included owner-occupied dwelling units in multi-dwelling-unit structures as well as in one-dwelling-unit structures. If the owner-occupied unit was in a structure containing more than one dwelling unit, or if a part of the structure was used for business purposes, the value reported in 1940 represented only that portion occupied by the owner and his household. No value data were collected for vacant units in 1940. Because the 1950 value data in this report are combined for owner-occupied and selected vacant dwelling units, they are not comparable with the 1940 results.

Median.--The median is the figure which divides the number of dwelling units reporting on a characteristic into two equal groups--one group containing units for which the figures for the characteristic are smaller than the median, and the other containing units for which the figures for the characteristic are larger than the median. For example, the median contract monthly rent is the rent which divides the units into two equal groups, one having rents lower than the median and the other having rents higher than the median.

SOURCE AND RELIABILITY OF DATA

Source of data.--The 1950 estimates presented in this report are based on a sample of approximately 3,100 dwelling units selected from those enumerated in the 1950 Census of Housing. These dwelling units are located in about 825 census enumeration districts systematically selected from all enumeration districts throughout the State. Although the figures are based on data transcribed from the 1950 Census, there may be differences between the data in the present report and the data to be published in the final 1950 Census reports, apart from differences caused by the sampling variability. The main reason for such differences is that the preliminary estimates do not include all of the refinements that result from the careful examination of the schedules and tables to which the census data will be subject prior to the publication of the final report.

The 1940 figures in this report are the results of the complete housing enumeration in the 1940 Census. These and more detailed figures on the same subjects may be found in the 1940 Census Reports on Housing.

Each of the 1950 figures is independently rounded to the nearest thousand; therefore the detailed figures do not necessarily add to the totals. Percentages for 1950 are based on the rounded absolute figures.

Reliability of 1950 estimates.--Because the 1950 estimates are based on sample data, they are subject to sampling variability. Although the smaller figures are subject to large relative sampling variability, they are shown in the tables to permit the analysis of various combinations which would have smaller relative sampling variability.

The following table presents the approximate sampling variability of estimates of selected sizes. The chances are about 19 out of 20 that the difference due to sampling variability between an estimate and the figure which will be available later from the complete tabulations of the 1950 Census is less than the sampling variability indicated below:

Size of estimate of 1950 data	Sampling variability of 1950 data	Size of estimate of 1950 data	Sampling variability of 1950 data
10,000.....	9,000	500,000.....	63,000
25,000.....	14,000	1,000,000.....	85,000
50,000.....	20,000	2,000,000.....	111,000
100,000.....	27,000	3,000,000.....	145,000
250,000.....	42,000	3,500,000.....	157,000
		4,148,000.....	176,000

In addition to the estimated number of dwelling units with the specified characteristics, the 1950 data in the tables in the report also include percent distributions. In general, the reliability of an estimated percentage de-

pends upon both the size of the percentage and the size of the total on which it is based. The following table presents the approximate sampling variability of estimated percentages based on totals of selected sizes:

If the estimated 1950 percentage is:	And if the size of the base is:					
	250,000	500,000	1,000,000	2,000,000	3,500,000	4,148,000
	Then the chances are about 19 out of 20 that the difference due to sampling variability between the estimated percentage and the percentage which will be available later from the complete tabulation of the 1950 Census is less than:					
2 or 98	2.1	1.5	1.1	0.7	0.6	0.5
5 or 95	3.3	2.3	1.6	1.2	0.9	0.8
10 or 90	4.5	3.2	2.3	1.6	1.2	1.1
25 or 75	6.5	4.6	3.3	2.3	1.7	1.6
50	7.5	5.3	3.8	2.7	2.0	1.8

To illustrate, of the estimated 829,000 rural dwelling units in the State, 77.8 percent were in 1-dwelling-unit detached structures without business. The sampling variability is about 3.6 percent. The chances are about 19 out of 20 that the percentage which will be obtained from the complete tabulation of the 1950 Census will be between 74.2 percent and 81.4 percent.

The tables in the report also show the percent change from 1940 to 1950 for many of the characteristics of dwelling units. The 1940 figures are used as the base in computing the percent change. Since the 1940 data are not based on a sample, the sole cause of the sam-

pling variability in these percentages is the variability in the 1950 estimates. The sampling variability of any percent change, therefore, is the sampling error of the estimated number of dwelling units possessing that particular characteristic in 1950, divided by the 1940 figure for that characteristic.

In addition to sampling variation and limitations of the types mentioned above, the estimates are subject to biases due to errors of response and to nonreporting. The possible effect of such biases is not included in the measures of reliability; data obtained from a complete count of all dwelling units are also subject to these biases.

LIST OF TABLES

Table	Page
1.--Occupancy characteristics of dwelling units, for New York, urban and rural: 1950.....	1
2.--Number of rooms in dwelling units, for New York, urban and rural: 1950 and 1940.....	7
3.--Tenure, number of persons, and persons per room in occupied dwelling units, for New York, urban and rural: 1950 and 1940.....	7
4.--Type of structure of dwelling units, for New York, urban and rural: 1950 and 1940.....	7
5.--Condition and plumbing facilities of dwelling units, for New York, urban and rural: 1950.	8
6.--Contract monthly rent of urban and rural-nonfarm renter-occupied and selected vacant dwelling units, for New York: 1950.....	8
7.--Value of urban and rural-nonfarm owner-occupied and selected vacant dwelling units, for New York: 1950.....	8
