# HISTORICAL STATISTICS OF THE UNITED STATES, 1789-1945

## REVISIONS

For more recent data, including revisions, see the current *Statistical Abstract of the United States* where, beginning with the 1949 issue (available about November 1949), these time series will be brought to date annually in a special appendix which will include revisions for earlier years.

## ERRATA

Page 1, series A 3-99 (text), general note, line 11, should read "was 321 billion dollars" and "was 353 billion dollars," not "million dollars."

Page 112, series E 265 (table), 1940 figure should read "31,061," not "31,601."

Page 118, series F 200-211 (text), lines 9-10, weight of standard case of salmon should read "48 pounds," not "45 pounds."

Page 174, series H 117 and H 124 (table), footnote 1 should read "Excludes loans," not "Includes loans."

Page 256, series N 86-89 (text), lines 18-19, should read "For 1920-1936, series N 86," not "series N 88."

Page 267, series N 67 (table), 1933 figure should read "-9.6," not "-9.9."

Page 273, series N 124-130 (table), omit headnote; table is in dollars, not thousands of dollars.

In a volume of detailed historical statistics it is inevitable that errors will occur which will be discovered only in use of the book. Users encountering such errors are urged to communicate them to the Bureau of the Census where they will be listed for correction in a revised edition. In the meantime, if a sufficient number of corrections accumulate, additional errata sheets may be issued. Those users who wish to be placed on the mailing list to receive such errata sheets should address a request in writing to the Director, United States Bureau of the Census, Washington 25, D. C.

## BUREAU OF THE CENSUS

J. C. CAPT, *Director*  
PHILIP M. HAUSER, *Deputy Director*  
A. ROSS ECKLER, *Assistant Director*  
HOWARD C. GRIEVES, *Assistant Director*  
MORRIS H. HANSEN, *Statistical Assistant to the Director*  
ROBERT Y. PHILLIPS, *Executive Assistant to the Director*  
CALVERT L. DEDRICK, *Coordinator, International Statistics*  
FRANK R. WILSON, *Information Assistant to the Director*

While this volume has been planned, assembled, and edited in the Bureau of the Census, with the advice and assistance of the Social Science Research Council, many other individuals and agencies contributed to its preparation, directly and indirectly. In some instances, individuals devoted themselves full-time for the period necessary to complete their phase of the project. In other instances, contributions were prepared by individuals while they maintained heavy responsibilities in their own offices. A number of private publishers, authors, and research organizations generously granted permission to use their materials. In some cases, they also made additional contributions in time and energy. General acknowledgments for each chapter are given on p. IV; other specific acknowledgments appear within the text in the various sections of the volume.

This volume was prepared in the office of Morris H. Hansen, Statistical Assistant to the Director of the Bureau of the Census,

under the supervision of Morris B. Ullman, Chief, Statistical Reports Section, by Bruce L. Jenkinson, A. Benjamin Handler, and William Lerner. Mr. Jenkinson, Chief, Statistical Abstract Unit, was primarily responsible for the planning and preparation of the report; Mr. Handler, Executive Secretary of the Social Science Research Council Committee on the Source Book of Historical Statistics, was primarily responsible for procurement of data and relationships with the agencies and individuals who contributed to the publication; and Mr. Lerner, Statistician, Statistical Abstract Unit, was primarily responsible for the review and editing of the materials as to content, adequacy, and coverage.

Dorothy M. Belzer acted as staff assistant, particularly with respect to tabular presentation, and was responsible for preparation of the materials for the printer. Claire F. Cahill checked all citations by reference to the original published sources and offered many constructive suggestions as to the content of the book.

### Social Science Research Council

The Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census, played an important role in the preparation of this volume. The Chairman of the Committee and its members gave considerable time and thought to the review of plans, to advising on proper courses of action, and contributed in other ways. In particular, J. Frederic Dewhurst, Chairman, was in a large measure responsible for the initiation of the project. The completed volume owes much

to his original outline of purpose, coverage, and arrangement. For a detailed statement of the origins of this historical volume, see introductory text.

Through a grant by the Committee on Research in Economic History (Arthur H. Cole, Chairman) of the Social Science Research Council, the full-time services of the Executive Secretary of the Advisory Committee were made available to the Bureau of the Census.

# CONTENTS

(The numbers following subjects are series numbers)

Chapter	Page
<b>Introduction</b> .....	V
<b>A. Wealth and Income</b> .....	1
National wealth (A 1-100) including early and more recent estimates. Income (A 101-207) including national product, national income, and income distribution.	
<b>B. Population Characteristics and Migration</b> .....	16
Population characteristics: Decennial summaries (B 1-23), area and population (B 24-30), sex, age, and race (B 31-144), urban-rural and farm residence (B 145-181). Migration: Internal migration (B 182-236), citizenship status and country of birth (B 237-303), immigration, emigration, and naturalization (B 304-352).	
<b>C. Vital Statistics, Health, and Nutrition</b> .....	39
Vital statistics, including births, deaths, marriage, and divorce (C 1-78). Health (C 79-119). Nutrition (C 120-155).	
<b>D. Labor Force, Wages, and Working Conditions</b> .....	55
Labor force (D 1-106). Hours, wages, and earnings (D 107-212). Productivity (D 213-217). Union membership and work stoppages (D 218-238).	
<b>E. Agriculture</b> .....	74
General statistics (E 1-116). Livestock, meat, dairying, and poultry (E 117-180). Crop statistics (E 181-243). Farm credit (E 244-269).	
<b>F. Land, Forestry, and Fisheries</b> .....	113
Public lands of the United States (F 1-24). Land utilization (F 25-68). Forestry (F 69-154). Fisheries (F 155-219).	
<b>G. Minerals and Power</b> .....	133
Value of minerals and production indexes (G 1-12). Fuels (G 13-64). Nonmetals (G 65-92). Metals (G 93-130). Mining employment and injuries (G 131-158). Power (G 159-233).	
<b>H. Construction and Housing</b> .....	160
Construction expenditures (H 1-39). Other construction data (H 40-80). Housing units (H 81-112). Nonfarm housing credit (H 113-135).	
<b>J. Manufactures</b> .....	176
General statistics (J 1-12). Production indexes (J 13-48). Value of output (J 49-148). Capital expenditures (J 149-151). Physical output of specific commodities (J 152-180).	
<b>K. Transportation</b> .....	188
Railroads (K 1-93). Shipping and water traffic (K 94-173). Road transportation (K 174-238). Air transport (K 239-273).	
<b>L. Price Indexes</b> .....	226
General price index (L 1). Wholesale price indexes (L 2-35). Cost of living, consumers' price, and retail price indexes (L 36-52).	
<b>M. Balance of Payments and Foreign Trade</b> .....	237
International balance of payments (M 1-41). Foreign trade including imports and exports of gold, silver, and merchandise (M 42-112).	
<b>N. Banking and Finance</b> .....	253
Banking statistics (N 1-147). Currency and gold (N 148-184). Money rates and security markets (N 185-232).	
<b>P. Government</b> .....	283
Elections and politics (P 1-61). Government civilian employment (P 62-88). Federal government finances (P 89-169). Copyrights, patents and trade-marks (P 170-187). State and local government finances (P 188-277).	
Appendix I. Monthly and Quarterly Indicators of Business Conditions.....	320
Appendix II. Basic Premises for Data Selection.....	350
Time-period and alphabetical indexes.....	353

## Acknowledgments for Chapter or Section Contributions

(Acknowledgments for single or small groups of series are included in the text for those series)

### Chapter A. Wealth and Income

Chapter prepared by Harlow D. Osborne, Economic Analyst, National Income Division, Bureau of Foreign and Domestic Commerce, Department of Commerce.

### Chapter B. Population and Migration

Material on population, internal migration, citizenship, and country of birth prepared by Bureau of the Census staff.

Basic text and series for immigration, emigration, and naturalization supplied by Mrs. Helen F. Eckerson, Supervisor of the Statistics Section, Division of Research and Education, Immigration and Naturalization Service, Department of Justice.

### Chapter C. Vital Statistics, Health, and Nutrition

Basic text and series on vital statistics supplied by National Office of Vital Statistics, Public Health Service, Federal Security Agency.

Basic text and series on health supplied by Division of Public Health Methods, Office of the Surgeon General, Public Health Service, Federal Security Agency.

Basic text and series on nutrition supplied by Bureau of Human Nutrition and Home Economics and Bureau of Agricultural Economics, Department of Agriculture.

### Chapter D. Labor Force, Wages, and Working Conditions

Material on labor force prepared by Bureau of the Census staff.

Basic text and series on wages and working conditions largely supplied by Bureau of Labor Statistics, Department of Labor, Margaret H. Schoenfeld, Economic Editor, coordinating.

### Chapter E. Agriculture

Basic text and series supplied by Bureau of Agricultural Economics and Farm Credit Administration, Department of Agriculture, Robert M. Walsh, Special Assistant to the Chief of the Bureau of Agricultural Economics, coordinating.

### Chapter F. Land, Forestry, and Fisheries

Basic text and series on public lands supplied largely by Branch of Research, Bureau of Land Management, Department of the Interior.

Basic text and series on land utilization supplied by Bureau of Agricultural Economics, Department of Agriculture.

Series on forestry supplied by Division of Forest Economics, Forest Service, Department of Agriculture.

Series on fisheries supplied by Statistical Section, Division of Commercial Fisheries, Fish and Wildlife Service, Department of the Interior.

### Chapter G. Minerals and Power

Basic text and series on minerals supplied by Economics and Statistics Branch, Bureau of Mines, Department of the Interior, Hubert D. Keiser and Allan F. Matthews, former and present editors of the *Minerals Yearbook*, coordinating.

Basic text and series on power supplied by Division of Finance and Statistics, Bureau of Accounts, Finance, and Rates, Federal Power Commission.

### Chapter H. Construction and Housing

Basic text and series on construction supplied by Keith W. Johnson, Economic Analyst, Samuel J. Dennis, Chief, Construction Economics Unit, and William H. Shaw, Chief, Construction Statistics Unit, Construction Division, in the Bureau of Foreign

and Domestic Commerce, Department of Commerce. Material was also supplied by: H. E. Riley, Chief, Construction and Public Employment Division, Bureau of Labor Statistics, Department of Labor; and Fred E. Schnepfe, Chief, Liaison Division, Public Roads Administration, Federal Works Agency.

Material on housing prepared by Bureau of the Census staff.

### Chapter J. Manufactures

Material on manufactures prepared by Bureau of the Census staff.

### Chapter K. Transportation

List of series on railroads suggested by: Bureau of Transport Economics and Statistics, Interstate Commerce Commission; and Bureau of Railway Economics, Association of American Railroads.

Material on water transportation prepared by staff of Bureau of the Census.

Series on road transportation supplied by Division of Research Reports and Statistics, Public Roads Administration, Federal Works Agency.

List of series on air transport suggested by J. Parker Van Zandt, Brookings Institution, and by Civil Aeronautics Administration, Department of Commerce. Data supplied by Civil Aeronautics Administration.

### Chapter L. Price Indexes

Basic text and series supplied by Prices and Cost of Living Branch, Bureau of Labor Statistics, Department of Labor.

### Chapter M. Balance of Payments and Foreign Trade

Basic text and series for balance of payments supplied by International Economics Division, Bureau of Foreign and Domestic Commerce, Department of Commerce.

Material on foreign trade prepared by Bureau of the Census staff.

### Chapter N. Banking and Finance

Data reviewed and basic text supplied by Division of Research and Statistics, Board of Governors of the Federal Reserve System.

### Chapter P. Government

Series and basic text on elections and State and local finance and employment were supplied by the Governments Division of the Bureau of the Census.

Data on Federal Government finance were prepared in the Bureau of the Census with the cooperation of the Office of the Technical Staff, Treasury Department.

Series and basic text on copyrights, patents, and trade-marks were supplied by P. J. Federico, Examiner-in-Chief, Patent Office, Department of Commerce.

### Appendix I. Monthly and Quarterly Indicators of Business Conditions

Chapter prepared by Geoffrey H. Moore, National Bureau of Economic Research. In transmitting the manuscript, Mr. Moore stated: "In preparing this chapter I have had the expert assistance of several members of the staff of the National Bureau of Economic Research. I am especially indebted to Arthur F. Burns for his critical advice on selection of series, and to Millard Hastay for preparing a number of the descriptive notes. Hanna Stern was mainly responsible for compiling the data and verifying sources. The F. W. Dodge Corporation and Business Statistics Organization, Inc., have kindly given permission to publish certain of their series."

# HISTORICAL STATISTICS OF THE UNITED STATES

## Introduction

This historical supplement to the *Statistical Abstract of the United States* presents, in compact form for ready reference, approximately 3,000 statistical time series which cover various periods from 1789 to 1945. In a very few instances, figures are shown for the colonial period and the years under the Continental Congress. These statistics reflect economic, social, and political aspects of the development of the Nation since the Federal Government was formally established.

The present edition is not intended as a final product. In terms of the objectives of the compilers it is preliminary in character and comprises, in effect, a working manuscript. As such, it establishes a pattern and provides a preliminary selection of materials. Gaps and weaknesses are thereby disclosed and problems crystallized. On the basis of the experience thus gained, and the suggestions and criticisms of users of this edition, the process of revision will make possible a more useful future edition.

This volume is designed to serve two immediate needs. *First*, to bring together for the convenience of users of statistics the historical series of wide general interest; and *second*, to provide, through brief descriptive text and precise source notes, a guide to the types of historical data available, so as to inform the user where further data can be obtained. These objectives are similar to those of the annual *Statistical Abstract of the United States*, except that in the annual volume the emphasis is on current data with limited historical data as background.

The historical statistics selected for presentation here consist primarily of data readily available in Federal agencies and in a few additional quarters. In the compilation task, the Bureau of the Census has not engaged in new research for the purpose of establishing new series, revising existent series, or interpreting the comparability through time of the statistics presented.

Furthermore, the conditions of compilation, particularly the time factor, made it impracticable to take full advantage of the research already performed by others. To locate and bring together for initial inspection any significant proportion of the contributions to historical statistics which may be found in government and other reports would be a formidable task in itself, exclusive of the evaluation necessary as a prelude to publication. Even the selection and preparation for publication of 3,000 statistical time series out of those most ready of access would have proved impracticable without the cooperation of the many government bureaus whose materials are shown.

In particular, it is felt that so-called "lapsed" series are not sufficiently represented here. These are series once compiled annually but abandoned at some time in the past. The reason for abandonment varies: A new and more adequate measure of the given phenomena may have become possible; the phenomena being measured may have ceased to exist, as in the instance of the statistics on slavery; the subject field may have been one in which the Federal Government ceased to collect data; or the phenomena may have receded to a position of minor import in our national life. A careful selection and presentation of such series would go far to provide a more complete statistical picture of the early and middle periods of the Nation's existence.

Major objectives of a future revision of this volume should include presentation of additional series less readily available, a selection of some of the more significant lapsed series which offer light on early American history, and series in a few additional subject fields for which statistics could not be presented in this first edition. It is hoped also that the present volume will stimu-

late research by others leading to filling in of gaps in historical knowledge—research that will afford materials for inclusion in future revisions.

## The Problem of Historical Statistics

The statistics of the Nation are an important and even indispensable tool in the proper portrayal of the status of the United States in various subject fields at various periods in time. There are surprisingly few general fields in which existent figures cannot supplement or clarify the qualitative historical records—figures which were compiled year by year during the course of events, or were reconstructed later on the basis of existent statistical evidence.

The extent to which statistical data are cited or taken into account in historical writings is frequently dependent upon the ready availability of the needed data to the writers. An understandable lack of knowledge as to the existence of historical statistics in a given field, and the relative inaccessibility of the volumes in which they may be found, combine to prevent their more widespread and effective use.

True, in some subject fields statistical time series are entirely lacking, particularly figures already arranged year by year. In many important fields, however, the past publications of the Nation, public and private, contain a wealth of data periodically compiled which reflect the fact that "a strong passion for statistics early developed itself in the life of our people . . ."<sup>1</sup>

*Sources of data.* Among the numerous sources of historical statistics of the United States are the annual reports of the executive heads of the various Departments, Bureaus, and other agencies of the Federal Government, reports of special Federal commissions established from time to time, the volumes of the various censuses of the United States, the printed debates of the Congress, the published reports of Committees of the Congress and the transcripts of hearings conducted by them on important legislative measures, the published reports and documents of State Governments, the statistical publications of private research foundations and organizations and of the universities and colleges of the Nation, and the great mass of statistical and other volumes printed privately by other organizations and individuals.

*Difficulty of accessibility.* The accessibility of these great masses of historical data to those who wish to use them is another matter. As matters stand, Senators and Congressmen, public officials, economic, social, and political historians, research workers, teachers, students, journalists, and authors, to mention only a few groups, who wish to consult the historical statistics "available" in published form on a given subject are faced with three major difficulties:

*First*, the determination of the existence of the data and the identification of the exact public or private document or volume in which the data may be found. Frequently, this requires a knowledge of the responsibilities of government bureaus in years long past, and the scope, coverage, and formal description or title of their official reports. The exact material which is desired may already have been compiled, but it may well be buried in an obscure special report or in the published documents of an early Congress—publications which few libraries may have on their shelves.

Furthermore, the present staff of the Government Bureau now responsible for the given subject field may have only a meager

<sup>1</sup> From a speech by Francis A. Walker, Superintendent of the Ninth and Tenth Censuses of the United States (1870 and 1880), delivered before the International Statistical Institute, Chicago, 1893.

knowledge of the detailed statistics contained in the early reports and published documents of their own and predecessor agencies.

*Second*, once an exact published source has been determined, the data may not be found already arranged in the form of a time series.

In some historical fields, such as banking, merchant vessel tonnage, and the fiscal affairs of the government, current or fairly recent government documents carry extensive statistical summary tables which provide the more important data carried far back in time year by year. In other fields, the annual reports and other documents present figures only for the most recent year. Accordingly, historical tables must be constructed laboriously by reference to as many volumes as there are years to be considered. This requires access to a collection of such volumes possessed by few libraries.

Even in Washington, D. C., at the seat of Government, where the extensive collections of the Library of Congress may be supplemented by reference to Bureau and Departmental libraries and records, the compilation of long-term time series by reference to individual annual reports is a laborious and time-consuming task.

*Third*, identification of changes in concept and coverage over a period of time is important since such changes may affect vitally the interpretation of the statistics for a span of years. Coupled with this is the need for definitions of terms employed in published historical tables, definitions which may be in a separate publication or may never have been published.

A ready "solution" of the first two difficulties by location of a previously compiled time series may prove deceptive. As a general rule, historical tables in government documents represent compilations of figures with a minimum of text and tabular notes. Definitions, where given, are usually for the current year; qualifications of data, particularly warnings as to changes in concepts and collection methods over the years, are often inadequate.

Grave risks are entailed in attempts to compile long-term time series of annual data by reference to successive issues of the *Statistical Abstract of the United States*. In each issue, many revised figures appear. Generally, these are for the immediately preceding year or years, but revisions in the more historical data are not uncommon. Statistics for the specific years for which data are shown in the most recent issue of the *Statistical Abstract* may be used with no greater precaution than is necessary when making use of any highly abbreviated presentation of historical statistics. However, the attempt to fill in data for omitted years by reference to earlier issues may well result in serious lack of comparability through time.

In view of the broad difficulties outlined above, it is apparent that no single reference volume can offer a complete solution to the problem of historical statistics, as such. At best, it can provide a selection of statistics in a number of broad subject fields and constitute a guide to the more basic and detailed sources of data—functions which comprise the objectives of *Historical Statistics of the United States*.

### Origins of This Volume

This volume stems directly from a resolution of the Committee on Problems and Policy of the Social Science Research Council which was transmitted to the Secretary of Commerce. That resolution urged that the Secretary give consideration to the compilation and publication by the Bureau of the Census of a source book of economic statistics.

The idea had been originated by J. Frederic Dewhurst who, in a memorandum dated April 12, 1945, outlined the need for a volume which would bring together within a single cover the most important of the comprehensive statistical series measuring the economic development of the United States over the past century or more. Dr. Dewhurst submitted his proposal, which included illustrative materials, to the American Statistical Association and the American Economic Association which, the same year, set up a Joint Committee to explore the practical problems of preparing such a volume. The Economic History Association,

which also expressed an interest, was invited by the Joint Committee to send representatives to its meetings.

The proposal was discussed by the Committee on Problems and Policy of the Social Science Research Council on July 28, 1945, which adopted and transmitted to the Secretary of Commerce the resolution referred to above.

In his reply to the Social Science Research Council, dated August 9, 1945, the Secretary of Commerce wrote "The Bureau of the Census is prepared to cooperate to the fullest extent possible in the preparation of this volume and is including in its budget request for next year (fiscal year 1947) the necessary funds for compilation and printing." The Bureau of the Census was particularly interested in this proposal because of the growing belief of staff members responsible for preparation of the annual *Statistical Abstract of the United States* that a historical supplement to that volume was needed. Such a supplement would provide users of the *Statistical Abstract* with needed historical compilations which some users now attempt to obtain by reference to successive back issues, frequently with unfortunate results as indicated above. Also, additional current statistics could be included in the annual issues of the *Statistical Abstract* if some reduction could be made in the space devoted to historical data. Funds were made available for this purpose in the appropriations for 1947 and compilation work was begun.

With the formal acceptance by the Bureau of the Census of responsibility for compilation of the volume, the Joint Committee was reconstituted and it became the Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census. The Committee on Research in Economic History of the Social Science Research Council made additional funds available so that the Committee on the Source Book of Historical Statistics could appoint a full-time executive secretary to work with the Bureau of the Census in the joint effort to insure that this book meet the widest possible needs.

### Planning and Compilation

As a first step in the actual preparation of this volume, the Bureau of the Census staff, with the advice and cooperation of the Advisory Committee, prepared a working outline and statement of basic premises to guide the selection of material. It was necessary to set up a procedure for reviewing and sifting the many series available in an effort to select for presentation in the limited space of a single volume those series that would be most widely useful.

After agreement on a basic framework, a number of agencies and persons were approached to prepare lists of significant available historical series for specific subjects which they would recommend for inclusion or to review and supplement lists prepared by the editorial staff of the volume. Since it was realized that there were many questions and much room for judgment in the preparation of these lists, it was intended that the lists be given a further broad review throughout the field of possible users in government, in business, and in the academic world. Most of these first lists were prepared or edited by persons in Federal government agencies since such persons were more readily available for consultation.

It soon became evident that the broader review process would be of limited value unless the data themselves could be made available to those who were to be asked to review the lists. This need led to the preparation of this edition without such a broad review.

**Comments and suggestions.** It is the intention of the Bureau of the Census to review this material systematically in the next few years. To this end, users of this volume are encouraged to send in any comments or any information they have which they believe

will make this volume more complete and more useful. The statement of "Basic Premises for Data Selection," which comprised the basic considerations for the project, is reproduced without significant change in Appendix II. This provides the criteria

against which contributions and suggestions for future editions should be measured. In itself, the statement of premises is subject to change, and criticisms and suggestions leading to its improvement will be welcomed.

## TECHNICAL NOTES

**Arrangement of the data.** Data finally selected for inclusion in this volume are arranged by subject in lettered chapters and numbered series. The chapter titles are of necessity somewhat arbitrarily chosen and certain materials could have been classified under several of them. On the whole, however, it is felt that subject matter of interest can readily be found by reference either to the subject-listing under the chapter titles in the table of contents or to the index on the last pages of the book. Because of the possible confusion of capital letter I and Roman numeral I and of capital letter O with zero (0), these two letters have been omitted in identifying the chapters.

Each series or tabular column is assigned a number, the first series in each chapter beginning with 1. Each series is further identified in the table titles and cross-references by prefixing the chapter letter. Thus, the 44th series in the chapter on Agriculture is designated as **E 44** to distinguish it from the 44th series in the chapter on Transportation designated as **K 44**.

All series begin with the most recent year for which data have been obtained and run backward in time. Insofar as possible, there are uniformly placed spaces above every year ending in 0 or 5. No data are shown for years subsequent to 1945; this was done partly because it facilitated the space arrangement, but primarily because a considerable body of 1946 figures were still preliminary at the time this volume was in preparation.

**Basic premises.** When preparing a volume of this type, certain basic premises must be established to guide the staff and consultants in the selection and preparation of the material. These premises are subject to modification in accordance with the problems encountered during the course of operations. A statement on the basic premises for *Historical Statistics of the United States* is presented as appendix II on page 350. The extent to which it has been possible, or impracticable, to adhere to the objectives and premises described will be apparent to the user of this edition. The following specific observations relate to the limitations of the tabular materials and descriptive text as found in this preliminary edition.

**Area coverage.** Data shown in this volume are for continental United States as a whole, unless otherwise specified in table titles, tabular notes, or descriptive text. In some instances, however, the source material used failed to specify clearly the exact area covered. Where practicable, the matter was investigated and the appropriate qualification added.

**Time coverage.** Three major problems of identification of time-periods were encountered: (1) The sources occasionally did not state whether the data were for a calendar or fiscal year; (2) if for a fiscal year, it was not always clear whether the data were for a fiscal year ending June 30, September 30, or some other date; (3) shifts in time coverage, as from calendar to fiscal year, during the period covered by the series, were not always clear in the source.

In all three instances, particularly where time shifts seemed likely to have occurred, an effort was made to determine the exact situation so far as practicable.

**Series linkage.** No formal attempt has been made in this edition to extend a single series farther through time by linking it to another series which terminated at or near the date on which the first series began, or stopped, as the case may be. However, in a number of instances, notably in the chapter on agriculture, such series have been presented in adjoining columns, with an overlap for a

period of years when available. In spite of this, some series which are presented here as continuous through the years are comprised of distinct segments. These series are shown thus in this volume for the following reasons:

1. The series have been transcribed as shown in the source materials. The volumes from which data were taken frequently present historical summaries in a given field for the purpose of permitting broad comparisons, or to bring out certain particular attributes for which the data shown are comparable, with tabular notes selected in terms of the particular presentation purpose. It is possible that notations vital to other types of interpretation were omitted. Thus, a series showing data from 1789 to the present may be adequately noted for use of those who wish to measure the extent to which certain present-day phenomena have their antecedents in past time; the same notes may well be useless, and the omitted notes vital, to a person whose interest is confined to the period 1820-1860.

Actually, the problem of omitted qualifications is inherent in virtually every time-series of any length. The series presented here are no exceptions to that rule. In general, where the sources used provided tabular notes, qualifying the data, such notes have been included here.

2. In some instances, the linkage of series had already been performed and published by competent research workers who had made a careful study of the factors involved. Such series have, of course, been presented here, citing the source. Even here, however, it should be noted that the research may have been carried on in terms of specific objectives. Consequently, the data are subject to increased qualifications when used for purposes other than those contemplated by the original responsible analyst.

**Omissions of data, "blank" cells.** The significance of dashes in tabular cells requires explanation, since their meaning tends to vary from series to series, and even within the same series. In general, the presence of cell "leaders" or "dashes" indicates merely that no information was provided for this volume. In respect to possible significance, dash entries may mean that (1) no information exists for the given year, (2) that the entry, if shown, would be zero (0), (3) the information was not available, whether because it was never requested, or whether it was requested but was not forthcoming, or (4) the information is believed to exist in published form but it was not practicable to do the research necessary to locate the appropriate source.

Further, the practices of the several government agencies and private sources of information differ as to the meaning of dashes in cells, the extent to which they label material as "not available," the meaning of the term "not available," the use of the zero (0) entry, etc.

In general, the policy adopted in preparing this volume, was to retain "not available" notations where they appeared for intermediate years in the series; to change them to dashes where they appeared at the beginning or end of the series. Where cells were left blank in the sources, they were filled with dashes in this volume.

Finally, since series of varying length taken from different sources are frequently found in adjoining columns, the stub listings for years necessarily encompass the earliest and latest date for which any of the series are shown. In itself, this tends to create many additional blank cells, as in the case where a series for 1885 to 1926 is placed next to the same stub as a series for 1880 to 1945.

## HISTORICAL STATISTICS OF THE UNITED STATES

Here again, the "blank" cells have been filled by dashes in order to make it easier for the user's eye to trace the entries for a given year across the entire table, through the otherwise blank columns.

The presence of dashes in the cells may thus have several meanings—it does not necessarily mean that the value is zero, not obtainable, or nonexistent. The user will have to judge from the context which meaning is appropriate in each particular instance.

**Responsibility.** Because of the multitude of sources and the varied subject matter covered, the Bureau of the Census cannot

accept responsibility for the accuracy or limitations of data other than those which it collects. Every attempt has been made insofar as time and personnel permitted to verify and label properly the material included here. The places where this was not always possible are indicated in the remarks, just preceding this section. Final responsibility for selection of the material, for accurate transmittal, and for proper presentation, rests with the Bureau of the Census, even though carried out with the cooperation of many individuals and agencies who devoted much time and energy in providing data and descriptions of series for this publication.

### FOR ADDITIONAL INFORMATION ON DATA PRESENTED

write to the agency indicated in the source note in the descriptive text for the given statistical series.

### SUGGESTIONS AND COMMENTS

should be sent to:

**The Director**  
**Bureau of the Census**  
**Washington 25, D. C.**

## STATISTICAL ABSTRACT PUBLICATIONS

### Annual Volume

*Statistical Abstract of the United States.* Since 1878, the official statistical yearbook of the United States—issued annually. Includes statistics from many sources, public and private. Current figures will be found there for many of the time-series presented to 1945 in the historical supplement. 1948 issue now available. 1054 p. Price \$2.75 (buckram).

### Historical Supplement

*Historical Statistics of the United States, 1789-1945.* Contains 3,000 statistical time series, largely annual, extending back through time—to 1789 where possible. Washington, D. C., 1949. 363 p. Price \$2.50 (buckram).

### Small-Area Supplements

*County Data Book.* A compact presentation of 91 items of significant social and economic data for every county in the United States and for each of 138 metropolitan areas. A map for each State shows the geographic relationship of counties, metropolitan areas, and principal cities. Washington, D. C., 1947. 431 p. Price \$2.75 (buckram).

*Cities Supplement—Statistical Abstract of the United States.* Includes 79 items of statistical data for each of the 397 cities having 25,000 inhabitants or more in 1940. Statistics on social, economic, and governmental subjects for each city have been assembled from a number of sources. Washington, D. C., September 1944. 47 p. (Out of print.)

Purchase orders should be addressed to the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

## Chapter A. Wealth and Income (Series A 1-207)

### National Wealth: Series A 1-100

#### EARLY ESTIMATES OF NATIONAL WEALTH (A 1-2)

**A 1. Total valuation of all the real and personal property in the United States, 1774-1807.** SOURCE: For 1774-1805, see Blodget, Samuel, Jr., *Economica; A Statistical Manual for the United States of America*, 1806 edition, p. 68; for 1806, 1807, see article signed "S. B." and entitled "Thoughts on a Plan of Economy (Suited to the Census of 1808) for the United States of America" in *Colwin's Weekly Register*, vol. I (Washington City, 1808), p. 235. Note: The Library of Congress file of *Colwin's Weekly Register* is incomplete. However, the copy of Blodget's *Economica* found in the Department of Commerce library (Washington, D. C.) includes, within the same binding, a copy of the article cited above. For a detailed statement for 1805, see *Economica*, p. 196, and table 1, below.

Interest in the national wealth of the United States arose long before interest in national income, just as modern balance-sheet concepts developed earlier than the concepts of the income account. The first serious attempt to estimate the wealth of this country appears to have been made by Samuel Blodget, Jr., the compiler of an early collection of statistics of the United States. His *Economica; A Statistical Manual for the United States of America* (1806 edition) includes a detailed statement of the estimated value of all the real and personal property in the United States for the year 1805 and also a series of national totals (series A 1), unsupported by details, extending back to 1774.

No statement is made by Blodget as to the source material underlying either of these two tabulations. It seems likely that the totals given for 1774-1804 were derived in much the same way as the 1805 figure, since the details of the latter are presented as being related to the former, and since most of the material which would be needed for estimating prior-year values on the same plan as for 1805 is actually included in the table which shows the prior-year wealth totals. The 1805 classification given by Blodget (*Economica*, 1806 edition, p. 196) is shown below in table 1. According to Blodget, "Slaves are rated too high till they are better managed; everything else is below the mark."

TABLE 1.—AN ESTIMATE OF ALL THE REAL AND PERSONAL PROPERTY IN THE UNITED STATES (EXCLUSIVE OF LOUISIANA TERRITORY): 1805

ITEM	Millions of dollars
Total valuation for 1805.....	2,505.5
1 million of habitations and apparel for 6 millions of persons, with shops, barns, implements, tools, furniture, etc., each 360 dollars.....	360
39 million acres of lands averaged at 6 dollars.....	234
150 million acres adjoining and near the cultivated lands averaged at 3 1/2 dollars.....	525
451 million acres, the residue of all the lands in the United States averaged at 2 dollars.....	902
Carriages and all livestock @ 70 dollars each family.....	70
Turnpike, canal, and toll bridge stock.....	15
10,000 flour, grist, saw, iron, and other mills, value not less than 400 dollars each.....	4
1 million slaves, average value 200 dollars.....	200
Country produce on hand for export, manufacturing, etc.....	26
Stock in trade: 1,000,000 tons shipping; European, India merchandise, etc.; specie; bank stock, insurance stock, and all incorporated funds.....	150
Public buildings, churches, Wash. city lots, arsenals, naval and military stores, arms, ammunition, frigates, dock yards, timber, etc.....	19.5

The second group of wealth statistics to be considered begins with the year 1813, when the Congress laid a direct tax on property. The valuations required for the administration of this tax were not tabulated, but were used in part as the base for a subsequent tax levied in 1815, when the valuations were tabulated. The total so

derived for the value of "houses, lands, and slaves" was 1,902 million dollars (the Louisiana Territory was excluded as its returns were incomplete), according to Timothy Pitkin's *A Statistical View of the Commerce of the United States* (1835 edition), p. 313. Of this total, Pitkin estimates the value of slaves included at roughly 300 million dollars.

Since under-assessment has been the rule rather than the exception in property tax administration, the total given by Pitkin is probably an underestimate. It is, moreover, too low to be consistent with Blodget's figure. But it is important partly because it illustrates the crude beginning of the method later developed by the Census, and partly because it was used by another nineteenth-century statistician (Burchard, see series A 2) as the starting point for a series of annual interpolations extending from 1825 to 1830.

**A 2. Estimated national wealth, 1825-1880.** SOURCE: *Annual Report of the Director of the Mint*, 1881, p. 71.

Horatio C. Burchard included in his *Annual Report of the Director of the Mint*, 1881, a historical table of price fluctuations over this 56-year period, and added series of annual estimates of the Nation's wealth and population for comparative purposes. These wealth estimates (series A 2), purport to be based for 1825-1850 on Pitkin's figure for 1815 and the Census total for 1850. The derivation of the 1851-1880 estimates is not explained, but was apparently the result of interpolation between the decennial census totals.<sup>1</sup>

Burchard's estimates include taxable property only, and probably exclude a good share of that in 1849 and prior years. His figures for 1850-1879 share the characteristics of the census totals of the period, described below.

#### MORE RECENT ESTIMATES OF NATIONAL WEALTH (A 3 100)

**A 3-99. General note.** During the period 1850-1922, that is, from the Seventh Decennial Census to the date of estimates included in the Federal Trade Commission report<sup>2</sup> on national wealth and income, there was a rapid development, both in technique and in basic data for statistics of wealth. The Bureau of the Census prepared estimates of national wealth for selected years, from 1850 to 1922 (see table 2 and series A 42-74). The Federal Trade Commission estimates for 1922, however, were considerably broader in scope than the Census estimates, covering items not included in the Census total. In consequence, where the Census total for 1922 was 321 million dollars, the Commission estimate was 353 million dollars.<sup>3</sup> These figures are not presented in detail here since this investigation was not repeated.

After 1922 the Bureau of the Census discontinued making estimates of wealth, but the series were ultimately carried forward to 1937 by the National Industrial Conference Board in the same general form (see series A 75-99). Also, a revision and extension of some of the census estimates was made by Simon Kuznets (see series A 3-41).

<sup>1</sup> A footnote in the 1880 Census Report on Valuation . . . reads as follows: "Since the above [statement of Census estimate as being \$43,642,000,000] was written I have discovered in the report of the Director of the Mint for 1881 (Table XXVII), an estimate of \$43,300,000,000 as the true valuation. The slight difference between these two estimates, amounting to only 3/10 of 1 per cent., is remarkable, when it is considered that they were made by very different methods; the estimate above quoted [Burchard's] having been deduced from the estimates at earlier censuses, by using the rates of increase." See Gannet, Henry, "The True Valuation of Real and Personal Property in the United States," comprising the introduction to Part I: *Valuation and Taxation, in Report on Valuation, Taxation, and Public Indebtedness in the United States as Returned at the Tenth Census (June 1, 1880)*, U. S. Department of the Interior, Census Office, Washington, D. C., 1884, footnote p. 11.

<sup>2</sup> Federal Trade Commission, *National Wealth and Income*, 69th Cong., 1st sess. Senate Document No. 126, Washington, D. C., 1926, p. 28.

The material based on these sources embraces the bulk of the statistics available on trends in national wealth and its components for the United States as a whole. An attempt has been made to arrange the data of the National Industrial Conference Board and the Bureau of the Census in such a way as to bring out such elements of comparability through time as exist, and to facilitate the linking together of discontinuous component series. Certain characteristics of the data are thus made very evident: (1) The National Industrial Conference Board series (series A 75-99) are comparable for 1922-37 but are clearly not in full agreement with the corresponding 1922 Census figures; (2) the Census components for 1900-1922 are fairly comparable from year to year in most cases, but many of the components disappear into other broader categories for 1880 and 1890 (series A 42-74); and (3) further disappearance of details for years back of 1880 leaves only enough of a breakdown for 1850-70 (see table 2) to serve as a reminder that the estimates are at least partly built up from components rather than global. Perhaps the basic weakness of the 19th century figures is that important types of wealth were covered incompletely or not at all. The outstanding gap of this sort is the omission of tax-exempt property in years prior to 1880, but there are many minor gaps as well. On the other hand, the Census total of personalty in 1870 included the value of mortgages secured by real estate which was also included as such.

The census totals for 1850-1870 were actually compiled as measures of the "value of taxable property" rather than of the national wealth. These totals represented the values as assessed for tax purposes, adjusted by the estimated ratio of "true" to assessed value. During this period there was a growing belief that personal property should not be taxed like realty. As a result, the States began to exempt various classes of personal property, and the public conscience became increasingly lenient toward the concealment of personalty from the tax assessors. In consequence, the aggregate value of assessed personalty declined decade by decade. Available details for 1850-1870 are shown in table 2, below, together with figures for 1880 for purposes of comparison. Because of these differences in scope, the 1880 data shown in table 2, except in some instances, disagree with data presented in series A 42-74.

TABLE 2.—VALUATION OF PROPERTY AND RELATED DATA:  
1850 TO 1880

[In millions of dollars. Figures are as shown in sources cited; they differ at times from figures in the original Census reports]

ITEM	1880	1870 (currency basis)	1860	1850
<b>VALUATION DATA</b>				
Property assessed for taxation:				
Estimated true value.....	43,642	30,069	16,160	7,136
Assessed value.....	16,903	14,179	12,085	-----
Real estate or property.....	13,037	9,915	6,973	-----
Personal estate or property.....	3,866	4,264	5,112	-----
<b>RELATED DATA</b>				
Manufacturing: Capital invested <sup>1</sup> .....	<sup>2</sup> 2,781	<sup>3</sup> 2,118	1,010	533
Agriculture: Value of—				
Farm lands.....	10,197	9,263	6,645	3,272
Machinery and implements.....	407	337	246	152
Farm livestock.....	1,500	1,525	1,089	544

<sup>1</sup> Figures are as shown in the 1870 and 1890 Census Reports on Manufactures; figures for 1880 and 1890 include adjustments for comparability through time.

<sup>2</sup> Modified figure. 1880 published total was 2,790 million dollars.

<sup>3</sup> Subsequent Census reports give 1,695 as the gold equivalent.

Sources: Reports of Bureau of the Census and predecessor offices. For figures on property assessed for taxation, 1850-1880, see Tenth Census (1880), *Report on Valuation, Taxation, and Public Indebtedness* . . . , part I, pp. 8-12. For figures on capital invested in manufacturing, 1850-1880, see Eleventh Census (1890), *Report on Manufacturing Industries* . . . , part I, p. 4. For figures on agriculture, 1850-1880, see Eleventh Census (1890), *Report on Statistics of Agriculture*, p. 84-85.

By 1880, it was recognized (1) that valuations made for tax purposes were not a satisfactory basis for determining trends in national wealth, and (2) that the decennial valuation totals were coming to be used more and more as measures of the Nation's progress rather than of its taxable capacity. Accordingly the plans for the Tenth Census (1880) provided for "a more searching exami-

nation into the true value of property." A broader base was thereupon adopted and the 1880 "estimated true value" was derived by making use, for the first time in this connection, of data from the Census of Agriculture, Manufactures, and Mining; from the Bureau of Customs; and from nongovernmental sources, particularly the Bradstreet Company. The national wealth in 1880 was estimated as the sum of a dozen component types of goods instead of as an adjusted total value of taxable property.

In addition, the value of churches, schools, asylums, public buildings of all kinds, and other exempt realty were specifically included for the first time. The general statistical approach was a compromise between the comparative firmness of estimates for later years and the uncritical global adjusting process formerly used. Firm bases were not available for estimating most components, but such data as were obtainable were exhaustively sifted, analyzed, and compared. For example, the estimate for household belongings was based on rough averages for each individual item in the hands of families classified by socio-economic group and by State of residence; the results were checked against a second estimate derived by assigning average periods of useful life to the items annually produced or imported.

The Census estimates for 1890 showed further improvement both in the technical quality of the report and in source data. Full use was made of data from various census reports. Terms and methods were defined in specific rather than in general terms. For instance, in 1890, tax-exempt realty was explicitly stated to include the public domain for the first time, whereas the 1880 report was silent on this point.<sup>3</sup>

The 1900 Census, authorized by the 1899 law, provided for direct investigation into the value of property employed in agriculture and manufacturing. The 1902 law establishing the Census Office on a permanent basis also authorized a report on "public indebtedness, valuation, taxation, and expenditures," and these laws resulted in two compilations of national wealth only 4 years apart, one as of 1900 and another as of 1904. Most of the basic data used related to the year 1900, and estimates for that year were extrapolated to 1904 by use of figures for 1900 and 1905 from the Censuses of Manufactures, of estimates by the Department of Agriculture, and other information. There were some major exceptions to this order of procedure. Thus, in the derivation of estimates for both years, 1902 Census of Mining data were used as were 1900 and 1904 valuations made in connection with State and local real property tax administration. A 1904 bench mark was used in estimating both the 1900 and 1904 values of railroad property.

The 1904 estimates are notable in that the method of bringing prior-year values up to date by use of production figures for the interim was employed extensively for the first time. This method was used in deriving or in testing a number of estimates at later censuses, and it was used extensively for the annual estimates of 1923-37, prepared by the National Industrial Conference Board.

The estimates for 1912 and 1922 differ from those for 1904, primarily as a result of progressive improvement in methods of estimating component details. These are indicated in the detailed text presented for the individual series, below.

A 3-41. Value of land, real estate improvements, and equipment, Census dates, 1880-1922. SOURCE: Kuznets, Simon, *National Product Since 1869*, National Bureau of Economic Research, New York, 1946. For series A 3-37, see pp. 201, 202, and 213; and for series A 38-41 (data in 1929 prices), see p. 231 of the source volume. Part IV of the source volume analyzes and recalculates national wealth estimates since 1880, "primarily in order to allocate capital formation by categories of users." The data shown are derived from a number of sources, particularly Census reports. Kuznets

<sup>3</sup> The 1922 report (Bureau of the Census, *Estimated National Wealth: 1922*, p. 17) has confused the issue by listing "value of public domain" as one of a number of items which were included in the estimates for 1880 and later years. The reference to 1880 is probably an error. This points up a general problem with respect to the early Census Bureau reports on wealth or valuation; statements made concerning reports or estimates of previous years need to be checked carefully to the reports of the years in question.

provides a detailed discussion of the adjustments and the sources of data. For the area which they cover, these figures are far more satisfactory for comparative purposes than the Census figures. They are designed, as the Census estimates are not, to meet the exacting modern standards of statistical research.

**A 42-74. Items of national wealth, 1880-1922.** SOURCES: Reports of the Bureau of the Census and predecessor offices. In particular, see *Wealth, Debt, and Taxation, 1907*; *Wealth, Debt, and Taxation, 1913*, vol. 1; and *Wealth, Public Debt, and Taxation: 1922*, section entitled "Estimated National Wealth." These volumes are the primary sources of data gathered in the investigations of 1900 and 1904, 1913, and 1922, respectively. Each provides a historical summary of the statistics for the decennial inquiries of 1880 and 1890. The sources for the 1880 and 1890 investigations are *Report on Wealth, Debt, and Taxation at the Eleventh Census: 1890*, Part II, "Valuation and Taxation"; and *Report on Valuation, Taxation, and Public Indebtedness . . . Tenth Census (June 1, 1880)*. In addition, as indicated in specific listings below, certain details of distribution have been derived from the Census reports on manufactures, agriculture, etc., of the several censuses.

**A 42. Total national wealth.** SOURCE: See text for series A 42-74. Represents the summation of statistics shown for series A 43-74.

**A 43-46. Real property and improvements, taxed.** SOURCE: See text for series A 42-74, above. These are estimates of true value based on ratios of true to assessed values. The ratios have usually been derived from State reports and from mail questionnaires addressed to tax assessors and others familiar with property valuation.

**A 47. Real property and improvements, exempt.** SOURCE: See text for series A 42-74, above. These figures have been derived from inquiries addressed to the owners of the property, in most years. Coverage was markedly incomplete in 1880 and 1890, and the 1912 estimate was calculated by applying to the value of taxable realty the ratio of exempt to taxable property approximated by extrapolation on the 1900-1904 trend and by reference to figures for four States for which figures on both types were available.

**A 48-49. Livestock, etc.** SOURCE: See text for series A 42-74, above. These series are based largely on estimates by the Department of Agriculture, supplemented for stock not on farms by reference to Census of Agriculture reports. For 1880 and 1890, principal reliance was placed on the Censuses of Agriculture. The 1880 national wealth tabulation showed the value of livestock combined with that of farming tools and machinery; the livestock figure (2,000 million dollars) has been obtained by deducting from the combined total the value of farming implements and machinery (407 million dollars) as shown in the 1880 Agriculture Census report (p. 4). The result differs conceptually from the 1880 figure for farm livestock shown in table 2, above, in that the latter makes no allowance for livestock not on farms. The implied estimate for nonfarm livestock is, of course, subject to a wide margin of error. For 1890, the amount of 394 million dollars for livestock not on farms has been deducted from "Miscellaneous" and added here, making series A 49 larger and series A 73 smaller by this amount than indicated in the published reports. See *Wealth, Debt, and Taxation, 1907*, p. 25, and *Wealth of the United States*, Census Office Bulletin No. 379 (March 19, 1894), p. 2.

**A 50. Farm implements and machinery.** SOURCE: See text for series A 42-74, above. The Censuses of Agriculture were the chief sources of data for this series, with adjustments for intercensal years made by use of Census of Manufactures data on production.

**A 51. Manufacturing machinery, tools, and equipment.** SOURCE: See text for series A 42-74, above. These estimates are based mainly on the capital investment items reported to the manufactures census, interpolations for intercensal years having been made by use of straight-line trends in the earlier period and sample data for 1922. The 1890 figure shown is an arbitrary estimate representing half the combined value of machinery and products reported as

capital to the manufactures census. (See *Wealth, Debt, and Taxation, 1907*, p. 25.) The value of this item for 1880 is probably concealed in the figures for realty and stocks of goods.

**A 52. Railroads and their equipment.** SOURCE: See text for series A 42-74, above. Reports to the Interstate Commerce Commission were the chief basis of the estimates for 1912 and 1922. The figures for 1900 and 1904 were derived by capitalizing earnings. The figure for 1890 (8,296 million dollars) constitutes the remainder after subtracting the street railway item (see series A 53) from the 1890 Valuation report figure of 8,685 million dollars which was described as "Railroads and equipment, including \$389,357,289 for street railroads." According to the 1890 Valuation report (p. 8), this represents the cost of construction and equipment, "about 7,000 miles being estimated."

In contrast the 1880 figure was derived from the combined balance sheet of "all railroads," representing total assets minus "profit and loss account." (See 1880 Transportation Census report, pp. 4 and 5.)

**A 53. Street railways.** SOURCE: See text for series A 42-74. The series as far back as 1912 is based on reports of the Census of Electrical Industries. Values for 1900 and 1904 were obtained by capitalizing earnings. The 1890 figure is described merely as based on the reported cost of construction and equipment, and was derived from the Street Railways Section of the 1890 Transportation Census report, p. 690. The item is not mentioned in 1880.

**A 54. Telegraph and telephone systems, shipping and canals.** SOURCE: See text for series A 42-74 and for series A 55-56 and A 57-58. The 1890 figure represents capitalized earnings. The 1880 total (of 419 million dollars), which excludes telephone systems, appears to represent the summation of figures appearing in the 1880 Transportation Census report as follows: For telegraphs, 93 million dollars; for merchant tonnage, all draft steam and sail, 156 million dollars; and for operating canals, 170 million dollars.

**A 55-56. Telegraph and telephone systems.** SOURCE: See text for series A 42-74. Estimates for these were derived from the same sources and by the same methods as those for street railways.

**A 57-58. Shipping and canals.** SOURCE: See text for series A 42-74, above. The values for government vessels, particularly those of the Navy, represent cost figures supplied by the departments concerned. Estimates for mercantile shipping have usually been derived by applying cost-per-ton ratios (from the manufactures census and other sources) to tonnages reported by the Commerce Department, and allowing for depreciation. Census reports (either of the Census of Waterways or of Transportation) also were available for 1880, 1890, 1906, and 1916, and were utilized in varying degrees. Values for canals and investment in canalized rivers for 1922 were taken from the Census of Waterways report of 1916; those for 1912 were based chiefly on State reports and figures from the U. S. War Department; those for 1890 were from the Transportation Census report of that year and were used again without change in 1900 and 1904; those for 1880 were from the 1880 Transportation Census report. The 1890 figure represented earnings capitalized at 5 percent; the 1880 figures were values set by owners.

**A 59. Pullman and other cars not owned by railroads.** SOURCE: See text for series A 42-74, above. ICC reports were the primary source for the 1912 and 1922 estimates. Values for 1900 and 1904 were approximated from the number of cars reported by the carriers. This item is not mentioned in the reports for 1890. In 1880, the Transportation report (see *Statistics of Railroads*, p. 4) makes clear that the value of Pullman and other cars not owned by the railroads is not included in the total shown for railroads and equipment, but provides no estimate.

**A 60. Pipe lines.** SOURCE: See text for series A 42-74, above. The 1922 figure is an unofficial general-purpose estimate supplied by the Bureau of Mines. No estimate was made for this item in tabulations for earlier years; it may well be included with real property and improvements.

**A 61. Privately owned waterworks.** SOURCE: See text for series A 42-74, above. This series is based on a figure supplied by the Bureau of Internal Revenue for 1922, a Bureau of Labor report for 1900, and a constant arbitrary rate of increase from 1900 through 1912. The item was not mentioned in the 1880-90 tabulations, but is probably included under one of the general headings for these years.

**A 62. Central electric light and power stations.** SOURCE: See text for series A 42-74, above. Data are from the Census of Electrical Industries.

**A 63. Agricultural, manufactured, and imported commodities, total.** SOURCE: The 1880 figure is from the 1880 report on Valuation, p. 11, where it is described as "Three-quarters of the annual product of agriculture and manufactures, and of the annual importation of foreign goods assumed to be the average supply in the hands of producers or dealers."

**A 64. Stocks of goods: Agricultural products.** SOURCE: See text for series A 42-74, above. The 1922 estimate was based for the most part on inventory figures from Agriculture Department and Census Bureau surveys; for certain minor crops, it was assumed that stocks on hand would represent 40 percent of the year's production. The approach based on carry over as a percentage of production was used in deriving the figures included in tabulations for the earlier years, output figures being derived from agricultural census data. It should be noted that the Census Bureau series for stocks of products differ from the National Industrial Conference Board series, being defined in terms of nature of products rather than of nature of holder.

**A 65-66. Stocks of goods: Manufactured products.** SOURCE: See text for series A 42-74. These figures, like those for farm products before 1922, are based chiefly on production data from the Bureau of the Census. The 1890 figure shown here is the estimate given in *Wealth, Debt, and Taxation*, 1907. It was designated in that volume as the value of products in the hands of the factory owners.

**A 67. Stocks of goods: Imported merchandise.** SOURCE: See text for series A 42-74. This series represents a fixed proportion of the total value of imports into the continental United States. The item was included in "Miscellaneous" and in "Mill stocks" in 1890.

**A 68. Stocks of goods: Mining products.** SOURCE: See text for series A 42-74. The 1922 value of coal stocks is estimated from a survey of commercial stocks; and for 1890 stocks of mining products are as reported to the Census of Mineral Industries in the case of mine stocks and the Census of Manufactures in the case of mill stocks. With these two exceptions the figures are based on production data which were obtained either from the Geological Survey or from the Bureau of the Census.

**A 69-73. Personal and miscellaneous property.** SOURCE: See text for series A 42-74. The 1922 value is based on a mail questionnaire for components other than vehicles. The estimate for motor vehicles was derived from production and average price and life data, and that for animal-drawn vehicles was computed from the reported numbers of horses and mules. For earlier years, estimates were based chiefly on statistics of imports and manufacturing production, usually without allowance for wholesale and retail markups. The 1890 method relied on a study of insurance policies on houses and contents, and the 1880 figure is based partly on assumed average values per family in each socio-economic group. The 1890 value of 7,894 million dollars given for "Miscellaneous" in the source has here been reduced by reclassification of nonfarm livestock to series A 49.

**A 74. Gold and silver coin and bullion.** SOURCE: See text for series A 42-74. These figures are taken from official government reports. The 1922 figure is from the Treasury Department; those for previous years are from the Director of the Mint.

**A 75-99. Classification of wealth in the United States, 1922-1937.** SOURCE: Adapted by permission from National Industrial Con-

ference Board. Figures are from *Enterprise and Social Progress*, New York, 1939, p. 60; text is from *Economic Record*, Oct. 5, 1939, p. 131.

**A 76. Real property and improvements, taxed, 1922-1937.** SOURCE: See text for series A 75-99. A continuous record is found in the assessments of property in the various States for the general property tax. In some instances, the sum of county assessments was used. In some instances real estate had to be separated from a record of all taxable property. When the assessment was biennial, or when the figures for 1936 had not been published, missing years had to be estimated. For each State and year, a ratio was found expressing the probable relation of actual to assessed valuation and the true value calculated.

**A 77. Real property and improvements, exempt, 1922-1937.** SOURCE: See text for series A 75-99. For seven States, official appraisals by the assessors of the value of exempt property are available, and from them true value was computed in the same way as for taxed real estate. The annual change for these States was applied to the Census record of 1922 for other States.

**A 78. Livestock, 1922-1937.** SOURCE: See text for series A 75-99. Based on the records of the Bureau of the Census and other information, the Department of Agriculture has prepared estimates for each year of the value of the principal forms of livestock. These were supplemented by figures for minor forms of livestock compiled by the Bureau of the Census in its five-year Census of Agriculture with interpolations for the intervening years.

**A 79. Farm implements and machinery, 1922-1937.** SOURCE: See text for series A 75-99. Based on reports of the Bureau of the Census, the Department of Agriculture has prepared annual estimates. They include motor vehicles, and since such motor vehicles figure elsewhere in the wealth estimate, it was necessary to compute for each year the value of farm motor vehicles and deduct it from the total estimate of the Department of Agriculture.

**A 80. Manufacturing machinery, tools, and equipment, 1922-1937.** SOURCE: See text for series A 75-99. The basis of the estimate is the value of capital assets (land, buildings, and equipment) reported by manufacturing corporations in the annual *Statistics of Income* for the years 1926-1936. It was adjusted to cover non-reporting corporations and non-corporate enterprises. A study of a large number of corporations reporting in *Moody's Industrial Manual for 1936* their machinery separately from land and buildings yielded a proportion which was applied to the total capital assets. For the years 1922 to 1925, the value of machinery obtained, as above noted, was carried back on the basis of change during this period in horsepower equipment reported in the Census of Manufactures.

**A 81. Railroads and their equipment, 1922-1937.** SOURCE: See text for series A 75-99. The value of railroads less depreciation is given annually in the report on *Statistics of Railways* of the Interstate Commerce Commission.

**A 82. Street railways, 1922-1937.** SOURCE: See text for series A 75-99. Plant investment less depreciation was obtained for the years 1922, 1927, and 1932 from the *Census of Electrical Industries*. Interpolation was made for intervening dates, and for the years 1933 and 1936 change was computed at the same rate as observed in the preceding four years.

**A 83-84. Telegraph systems, 1922-1937.** SOURCE: See text for series A 75-99. The data for investment less depreciation from the *Census of Electrical Industries* for the years 1922, 1927, 1932, and 1937 were supplemented by interpolations which took into account the changes noted in the annual reports of a large group of companies to the Interstate Commerce Commission.

**A 85. Telephone systems, 1922-1937.** SOURCE: See text for series A 75-99. Data for the years 1922, 1927, 1932, and 1937 were from the same source as those for telegraph companies and interpolations were made in the same manner.

**A 86. Pullman and other cars not owned by railroads, 1922-1937.** SOURCE: See text for series A 75-99. Data for cars of the Pullman

Company and of the express companies were obtained from the annual report on *Statistics of Railways* of the Interstate Commerce Commission. The number of freight cars owned by shippers was furnished by the American Railway Car Institute. This organization computed the total value of such cars for two years and, on the basis of average values and number of cars, interpolations were made for other years.

**A 87. Pipe lines, 1922-1937.** SOURCE: See text for series A 75-99. Annual data are available in the report on *Statistics of Railways* of the Interstate Commerce Commission.

**A 88-89. Shipping and canals, 1922-1937.** SOURCE: See text for series A 75-99. The value of ships of the United States Navy is reported annually by the Navy Department. Value of other shipping and canals was based on data for capital assets (lands, buildings, and equipment) for 1930 to 1936 for corporations engaged in "Water Transportation," defined as "ocean and fresh-water lines, canals, docking, drawbridge operating, lighterage, salvaging, piloting, wharfing, and lessors." The information was drawn from its work sheets by the Bureau of Internal Revenue and furnished the National Industrial Conference Board. For earlier years figures were computed in proportion to changes in the documented shipping of the United States and with consideration of changes in the prevailing price levels.

**A 90. Privately owned waterworks, 1922-1937.** SOURCE: See text for series A 75-99. Data for the years 1930 to 1936 were furnished from unpublished records by the Bureau of Internal Revenue. For earlier years, population changes of towns supplied by private waterworks were taken into account in computing the investment.

**A 91. Privately owned central electric light and power stations, 1922-1937.** SOURCE: See text for series A 75-99. The data for the years 1922, 1927, 1932, and 1937 were obtained from the *Census of Electrical Industries*. The interpolation for the intervening years was made on a straight-line basis for each State individually, and the results added to obtain the totals.

**A 92. Stocks in the hands of producers: Farmers, 1922-1937.** SOURCE: See text for series A 75-99. For a few of the principal crops, the Department of Agriculture has computed the value of crops remaining in farmers' hands unsold at the end of the year. For other crops, holdings expressed in bushels can be converted into values. For other important crops, figures are available for production and farm value, but not for stocks, and these were computed in the same ratio as for the group of crops for which figures were available. The crops for which values were given or computed represent practically all the important crops of which an appreciable amount remains unsold in farmers' hands at the end of the year.

**A 93. Stocks in the hands of producers: Manufacturers, 1922-1937.** SOURCE: See text for series A 75-99. For the years 1926 to 1936, the inventories of manufacturing corporations given in the *Statistics of Income* were supplemented by proper allowances for nonreporting corporations and noncorporate enterprises. For the earlier years' inventories were computed in the same ratio to gross sales (data for which are available) as in the later years.

**A 94. Stocks in the hands of producers: Mine operators, 1922-1937.** SOURCE: See text for series A 75-99. For the years 1926 to 1936, data for the inventories of mining and quarrying corporations are available in the *Statistics of Income*, and they were extended backward to 1922 in the same ratio that these inventories bore in the later period to the total value of all mineral production.

**A 95. Stocks in the hands of dealers: Wholesalers, 1922-1937.** SOURCE: See text for series A 75-99. Information regarding stocks and sales of dealers is available in the *Census of Distribution* for 1929, 1933, and 1935. By means of a sample census in 1937, estimates may be made for 1936. Official estimates for sales in other years have been made by the Department of Commerce and inventories may be computed. For the years before 1929, total sales were computed as a percentage of the total value of movable goods

produced in the United States as computed by the Bureau of Foreign and Domestic Commerce for census years with interpolations for other years. Inventories were then computed as a percentage of such estimated sales.

**A 96. Stocks in the hands of dealers: Retailers, 1922-1937.** SOURCE: See text for series A 75-99. Data for stocks and sales of retailers parallel to those for wholesalers are available in the *Census of Distribution*. It was observed that retail sales were an almost constant proportion of the estimated national income, and this ratio was used to estimate retail sales before 1929, from which sales estimates, the inventory estimates were computed.

**A 97. Stocks of goods in the hands of consumers, 1922-1937.** SOURCE: See text for series A 75-99. These figures are a projection of those found in the Bureau of the Census estimate for 1922. A study of the production, exports, and imports of a large number of articles of personal consumption was made and an index of change since 1932 was computed. The application of this index to the Census estimates provided the estimates used by the Board.

**A 98. Motor vehicles, 1922-1937.** SOURCE: See text for series A 75-99. A complex study of motor vehicle production, registration, mortality, prices, and depreciation was required. From registration figures the number of vehicles in use was obtained; from production and mortality figures, the number of each age in each year; from the original price of each year's product and the amount of depreciation, the value of cars of each age in each year was determined, and the sum of the latter gave the total value of all cars in use.

**A 99. Gold and silver coin and bullion, 1922-1937.** SOURCE: See text for series A 75-99. Monetary gold was figured at official rates; monetary silver, at the New York price for fine silver.

**A 100. Value of land and buildings on Manhattan Island, 1833-1945.** SOURCE: Lawyers Title Corporation of New York. These amounts represent totals for which all land and buildings on Manhattan Island might have sold under price levels prevailing at the time. They are computed from total assessed valuation of all land and buildings at the percentage above or below assessments shown by considerations paid in all sales at the time of sale.

### Income: Series A 101-207

**A 101-207. General note.** The general idea underlying the varying definitions of national income is clearest in the hypothetical case of a nation populated solely by subsistence farmers, each farm family being self-sufficient. In such a nation, the income of each farmer would be the produce of his farm. As a producer, he could be thought of as earning wages, profits, rent, and interest from his farm in the form of produce. As a consumer, he could be thought of as "buying" from his farm all the goods and services needed for his family's living, and "investing" the remainder of his output to maintain and improve the farm.

The national income of this hypothetical nation would be the value of the aggregate produce of all farms, classified into wages, profits, rent, and interest received in kind by farmers as producers. The national product would also be the value of the aggregate produce of all farms, classified into output "purchased" by farmers as consumers plus the output "invested."

In order to summarize these national aggregates, of course, it would be necessary to place values on the various items of output and then to total up the values. For different purposes, different bases of valuation are appropriate. For example, it may be felt that the contribution of a given item of output to the national welfare is measured in some sense by the market value of that item. To obtain a national aggregate related to welfare, then, output would be valued at market prices. On the other hand, the use of labor and capital required to produce a good may be measured in some sense by the labor and capital costs of producing it. To obtain a national aggregate measuring cost or input of economic effort, then, output would be valued at the labor and capital costs ("factor cost") of production.

The logic underlying this is that the market prices of goods are proportional to the marginal utilities (or marginal substitution ratios) of those goods, so that a deflated series of estimates of national income at market prices is a composite index of physical quantities each weighted by its marginal utility; similarly, factor costs of goods tend to be proportional to the marginal costs of those goods, so that a deflated series of estimates of national income valued at factor cost is a composite index of physical quantities each weighted by its marginal cost. (See J. R. Hicks, "Valuation of the Social Income" in *Economica*, vol. VII (new series), No. 26, May 1940.)

For different purposes, different bases for classifying the items of output are appropriate. Those interested in marketing want different classifications than those interested in utilization of available resources, or in human welfare. The data are presented in the tabular pages in such a way as to reflect these and other interests.

Extensive discussions of national income and product theory and statistics are found in the following:

**A 101-144. Estimates of gross national product, national income, and personal income (revised, July 1947), 1929-1945.**<sup>4</sup> SOURCE: Department of Commerce, Office of Business Economics, *National Income and Product Statistics of the United States, 1929-46*, comprising the *National Income Supplement to Survey of Current Business*, July 1947, p. 19. In 1948 the Office of Business Economics was preparing a detailed explanation of the analytical significance of these series and the statistical methodology underlying them. The definitions for specific series given below are abridged from the *National Income Supplement*, pp. 8-10. For an explanation of the concept of national income, see general note for series A 101-207, above. For earlier unrevised time series in these fields, carried back to 1909 for some categories, see *Basic Facts on Employment and Production*, comprising a Report to the Committee on Banking and Currency, Senate Committee Print No. 4, 79th Congress, 1st Session, Washington, D. C., 1945.

**A 101-116. Gross national product or expenditure (revised, July 1947), 1929-1945.** SOURCE: See text for series A 101-144, above. Estimates are presented by categories designed to answer

the questions: "Who purchases the output?" and "How is the output used?" These questions are salient from the marketing standpoint. The values are at market prices which are more suitable than factor costs for dealing with problems of marketing and consumption.

**A 101. Gross national product (revised, July 1947).** SOURCE: See text for series A 101-144, above. Gross national product or expenditure is here defined as the market value of the output of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for business and institutional consumption of durable capital goods. Other business products used up by business in the accounting period are excluded. The Nation's economy in this context refers to the labor and property supplied by residents of the Nation. Gross national product comprises the purchases of goods and services by consumers and government, gross private domestic investment, and net foreign investment.

**A 102-105. Personal consumption expenditures (revised, July 1947).** SOURCE: See text for series A 101-144, above. These consist of the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. They include the rental value of owner-occupied houses but exclude purchases of dwellings, which are classed as capital goods.

**A 106-111. Gross private domestic investment (revised, July 1947).** SOURCE: See text for series A 101-144, above. This consists of acquisitions of newly produced capital goods by private business and nonprofit institutions and of the value of the change in the volume of inventories held by them.

**A 112. Net foreign investment (revised, July 1947).** SOURCE: See text for series A 101-144, above. Net foreign investment is the net change in international assets and liabilities, including the monetary gold stock, arising out of the current international flows of goods and services, factor incomes, and cash gifts and contributions.

**A 113-116. Government purchases of goods and services (revised, July 1947).** SOURCE: See text for series A 101-144, above. The total measures purchases of goods and services by government bodies, exclusive of acquisitions of land and used depreciable assets and of current outlays of government enterprises. It excludes government interest, subsidies, social insurance and veterans' benefits, direct relief, etc. Sales to abroad and domestic sales of consumption goods and materials (series A 115) are netted out.

**A 117-133. National income by distributive shares (revised, July 1947), 1929-1945.** SOURCE: See text for series A 101-144, above. From the standpoint of producers and others interested primarily in the productive process, the salient questions to be answered relate to the utilization of available resources or to the distribution of returns. The utilization of available resources may occasionally, as in wartime, become of immediate interest to consumers. Normally, however, those primarily concerned are the producers who are making the resources available, because such utilization represents the demand for their services and hence the source of their income. These series illustrate one of the classifications most frequently used in this connection.

The relationship of utilization to personal income is brought out by a comparison with series A 169-175 which shows aggregate payments of income similarly classified. The two groups of series differ only superficially in the items shown. The essential difference is that the total in series A 117 represents use of resources—*income earned* by the factors of production—while the total of series A 169-175 represents income received as a reward for such use. Some parts of income earned, such as corporate savings, have definitely not been received by the individuals concerned and indeed may never be received by them. Such items are deliberately excluded from series A 169-175. On the other hand, individuals frequently receive personal income which does not appear to reflect any use of resources.

<sup>4</sup> These series are brought to date regularly in monthly *Survey of Current Business*. For figures through 1947, with 1947, with 1944-45 revised, see July 1948 issue.

**A 117. National income (revised, July 1947).** SOURCE: See text for series A 101-144, above. This series is defined as the aggregate earnings of labor and property which arise from the current production of goods and services by the Nation's economy. The Nation's economy in this context refers to the labor and property supplied by residents of the Nation. Earnings are recorded in the forms in which they accrue to residents of the Nation, inclusive of taxes on those earnings. As such they consist of the compensation of employees, the profits of corporate and unincorporated enterprises, net interest, and the rental income flowing to persons.

**A 118-123. Compensation of employees (revised, July 1947).** SOURCE: See text for series A 101-144, above. This is the income accruing to persons in an employee status as remuneration for their work. From the employer's standpoint, it is the direct cost of employing labor.

**A 123. Supplements to wages and salaries (revised, July 1947).** SOURCE: See text for series A 101-144, above. Supplements include employer contributions for social insurance and to private pension and welfare funds, compensation for injuries, directors' fees, pay of the military reserve, etc.

**A 124-127. Proprietors' and rental income (revised, July 1947).** SOURCE: See text for series A 101-144, above. Proprietors' income measures the monetary earnings and income in kind of sole proprietorships, partnerships, and producers' cooperatives from their current business operations. Rental income of persons is similar but is supplementary rather than occupational income for the most part. An inventory valuation adjustment has been made in series A 124-125 corresponding to that described in text for series A 132. No valuation adjustment is required for farm inventories because farm income, unlike other business income, is measured exclusive of inventory profits.

**A 127. Rental income of persons (revised, July 1947).** SOURCE: See text for series A 101-144, above. This consists of the monetary earnings of persons from the rental of real property, except those of persons primarily engaged in the real estate business; the imputed net rental returns to owner-occupants of nonfarm dwellings; and royalties received by persons.

**A 128-131. Corporate profits (revised, July 1947).** SOURCE: See text for series A 101-144, above. The corporate profits component of national income measures the earnings of corporations organized for profit which accrue to residents of the Nation, measured before Federal and State profit taxes, without deduction of depletion charges and exclusive of capital gains and losses.

**A 132. Inventory valuation adjustment.** SOURCE: See text for series A 101-144, above. In estimating the corporate profits component of national income (series A 128) an adjustment is made to series A 129 to approximate the same measure of profits that would be obtained if businesses valued their cost of goods sold at average cost-prices current during the year rather than at historical or book costs.

The common accounting procedure is to calculate cost of goods sold as equal to Beginning inventory plus Purchases minus Ending inventory. The unit cost-prices reflected in the book value of the Beginning and Ending inventories may differ from the average cost-prices of the year, and an adjustment is then needed to remove the effect of the difference. This adjustment entails repricing the Beginning and Ending inventories in terms of the year's average cost-prices. Substitution of these repriced inventories in the above common accounting formula, B plus P minus E, yields cost of goods sold valued at average cost-prices current during the year.

When average current costs so computed exceed book costs, the latter should theoretically be adjusted upward to the former for national income purposes; this requires an equal downward adjustment in profits, and series A 132 is then negative. Contrariwise, when average current costs are less than book costs, the latter should be adjusted downward and profits upward by the amount of the difference, and series A 132 is then positive. To generalize, any difference between the current costs and the book costs calls

for a correction in the latter and for an equal but opposite correction in book profits. A negative inventory valuation adjustment, numerically, is the amount by which book costs are an understatement of average current costs, and a positive adjustment measures a corresponding relative overstatement in book costs.

**A 133. Net interest (revised, July 1947).** SOURCE: See text for series A 101-144, above. This measures the monetary interest and the imputed interest accruing to the Nation's residents from private business and from abroad, minus government interest disbursements to corporations. Imputed interest consists of the value of financial services received by persons without explicit payment and property income withheld by life insurance companies and mutual financial intermediaries on the account of persons.

**A 134-144. Personal income and disposition of personal income (revised, July 1947), 1929-1945.** SOURCE: See text for series A 101-144, above. Personal income is the current income received by persons from all sources, inclusive of transfers from government and business but exclusive of transfers among persons. Not only individuals (including owners of unincorporated enterprises), but nonprofit institutions, private trust funds, and private pension and welfare funds are classified as "persons." Personal income is measured as the sum of wage and salary receipts, other labor income, proprietors' and rental income, interest and dividends, and transfer payments. It is equal to national income minus such unrealized items as corporate-profits taxes and undistributed profits, and plus such items not currently earned as public debt interest and transfer payments. The total is conceptually similar to that distributed in series A 169-175. The income series shown here are now kept current on a monthly basis in the *Survey of Current Business*. For 1944-45 revisions, see July 1948 issue.

**A 145-153. Estimates of national income and aggregate payments (Kuznets), percentage distribution by industry, 1869-1938.** SOURCE: Simon Kuznets, *National Income: A Summary of Findings*, National Bureau of Economic Research, New York, 1946, p. 40. See text for series A 154-164, below. These series are suggestive of trends in the industrial structure of the economy, despite limitations due to imperfect interperiod comparability and to weaknesses in the basic data for the earlier years. Figures indicated as "based on NBER estimates. . ." are noted in the source as averages of annual estimates appearing in Kuznets, Simon, *National Income and Its Composition*, cited above, vol. 1, table 59. Figures indicated as "based on Martin's estimates. . ." are noted in the source as based on estimates in Martin, R. F., *National Income in the United States, 1799-1938*, National Industrial Conference Board, New York, 1939. See also general note for series A 101-207, above.

**A 154-164. Estimates of realized private production income, by industries (National Industrial Conference Board), 1799-1938.** SOURCE: The National Industrial Conference Board, *Enterprise and Social Progress*, New York, 1939, p. 95.

A form of classification of considerable interest in connection with resource utilization emphasizes the relative importance of various industries as users of resources. The income and product estimates in these and other tables presented here are more reliable for the 20th than for the 19th century, and more reliable for the years after 1869 than before. See also general note for series A 101-207, above.

**A 165-168. Percent of population with purchasing power equivalent to specified number of 1929 dollars (Tucker), selected years, 1863-1935.** SOURCE: Rufus S. Tucker, "The Distribution of Income Among Income Taxpayers in the United States, 1863-1935," *Quarterly Journal of Economics*, August 1938, pp. 574-575. See also general note for series A 101-207, above.

One additional classification system used in income statistics deserves attention. This is the classification of personal incomes according to size. Series A 165-168 present the longest time series of this nature available for the United States. The distribution shown is based on income tax statistics and shows, for selected years since 1863, the percentages of the population with "middle-

class" and with "upper-class" personal incomes. The dollar limits of these two classes are arbitrarily assigned. The "middle class" is represented by three series corresponding to three alternative definitions which place the lower limit for incomes in this class at \$2,000, \$3,000, and \$4,000, respectively. The population series used as base for the percentages shown includes housewives, children, the aged, and other non-income-earning groups; most of these individuals were undoubtedly supported by the income recipients counted. Consequently, this table does not imply the tremendous inequality of incomes which an uncritical examination of it might suggest. It was rather designed to bring out *changes* over time in the size of the middle and wealthy classes.

Because of limitations in the basic data available alike for the determination of incomes and for the conversion of these incomes into dollars of 1929 purchasing power, these estimates are inevitably subject to a substantial margin of error. They are given here because they are believed to represent the best statistical approximation ever made to the facts concerned.

**A 169-175. Estimates of aggregate payments (Kuznets), percentage distribution by type, 1870-1938.** SOURCE: Simon Kuznets, *National Income: A Summary of Findings*, National Bureau of Economic Research, New York, 1946, p. 50. The primary sources of these data are as follows: NBER estimates from Kuznets, *National Income and Its Composition*, vol. 1, table 22; Martin's estimates from Martin, R. F., *National Income in the United States, 1799-1938*, National Industrial Conference Board, New York, 1939, tables 4, 41-44, and 46; King's estimates from King, W. I., *The Wealth and Income of the People of the United States*, New York, 1919, table XXXI, p. 160. See also general note for series A 101-207, above.

The temporal shifts indicated in series A 165-168 are the resultants of many economic forces working together. Most of these forces operate through the industry and share classifications of national income discussed above, to impinge on the size distribution through the relationship of resource utilization to personal income. Series A 169-175 are presented to suggest one type of shift in resource utilization patterns which is particularly significant in determining cyclical changes in the size distribution. Its significance is analyzed on pp. 49-52 and 97-106 of *National Income: A Summary of Findings*. The same subject is considered on pages 124-132 of the National Industrial Conference Board, *Enterprise and Social Progress* (see text to series A 176-194, below). The limitations indicated for series A 145-153, above, also apply here.

**A 176-194. Estimates of percent of national income in the United States received by specified proportion of recipients arranged according to size of income (National Industrial Conference Board), selected years, 1910-1937.** SOURCE: National Industrial Conference Board, *Enterprise and Social Progress*, 1939, p. 125. See also general note for series A 101-207, above.

These series attempt to avoid the problem of price fluctuations by classifying income recipients according to their rank in size of income rather than by dollar amounts of income received. In series A 185-194, recipients are divided into ten numerically equal classes distinguished according to the relative size of the members' incomes, and the proportionate share of each class in total personal income is tabulated for selected years. In series A 176-184, these shares are cumulated from the top class down to indicate the share of the most prosperous 10 percent, 20 percent, etc., of the population. All these percentages are based on estimates by Spahr, King, Macaulay, Leven, and the National Industrial Conference Board, varying in concepts and reliability. They have been adjusted to make them comparable from year to year by means of rough statistical techniques involving compensatory shifts in class limits, and cannot pretend to exactness. Series A 176-194 are included here because this presentation utilizes estimates representing complete distributions and therefore provides otherwise unobtainable data on income shifts in the lower income classes over a long period.

**A 195-197. Estimates of annual changes in percentage shares of total income payments received by upper and lower income groups**

(Kuznets), 1919-1938. SOURCE: Simon Kuznets, *National Income: A Summary of Findings*, National Bureau of Economic Research, New York, 1946, p. 99. See also general note for series A 101-207, above.

These series employ the same general mode of analysis as series A 176-194, distribution being divided into groups based on the size rank of the personal incomes, and the percentage share of each group being tabulated for each year. The existence of income tax and other data for the top income classes in these years has made possible a high degree of conceptual refinement; the definition of income payments in these series excludes capital gains, gifts, and other such transfers, while it was impossible to exclude these items from series A 176-194.

**A 198-207. Estimates of gross and net national product, averages per year by decades, 1869-1938.** SOURCE: Simon Kuznets, *National Product Since 1869*, National Bureau of Economic Research, New York, 1946, p. 119. See also general note for series A 101-207, above.

Data reflect a peacetime concept. "In the peacetime concept of national product, war goods are treated as a species of capital . . .," and "capital formation is the sum of new construction, whether for war or other purposes (both excluding maintenance repairs); flow of producers' durable equipment to final users, including war types; net flow into all inventories, except final consumers'; net changes in claims against foreign countries, no matter how originated in the production process." See source volume, pp. 13-14.

As has been pointed out above, the appropriate basis of valuation and of classification varies with the purpose to be served by the estimates. One further variation according to purpose should be noted—variation in degree of "grossness." In the hypothetical nation of subsistence farmers, the aggregate produce of all farms could be taken to include feed, seed, and fertilizer subsequently used up in the process of raising crops and livestock for consumption. It could be taken, exclusive of these, to include only the output actually available for human consumption and for maintaining and improving the farm. Alternatively it could be taken to include only produce available for human consumption and farm improvement, or it could be taken to include only produce available for human consumption.

That is, output could be defined exclusive of producers' nondurable goods, of producers' nondurable and durable replacement goods, or of all producers' goods. The two alternatives most commonly adopted are the first and second of these three. Series A 201 and A 202 illustrate these two alternatives and the manner in which they are derived. Capital formation here is defined in both variants to exclude output of producers' nondurable goods. "Gross" capital formation (series A 199) includes producers' durable goods whether for replacement or expansion, and "net" capital formation (series A 200) includes only the output of such goods representing expansion in the productive assets of the economy. These notes also apply to the corresponding series in 1929 prices (A 203-207).

For most purposes the gross capital formation and gross national product figures are the more appropriate. From the viewpoint of the sales manager, an order is an order regardless of whether the buyer plans to use the goods for replacement or for expansion. From the viewpoint of the business forecaster, the contribution of the producers' goods industries to the Nation's purchasing power is dependent upon the level, rather than upon the nature, of the demand for producers' goods. Finally, the economic factors which determine the level of this demand operate so that replacement and expansion purchases rise and fall together.

From the standpoint of objective welfare, however, the using up of goods in the productive process is an offset to the gross output. On the subjective side, too, product which the owner considers it necessary to set aside for replacement needs is scarcely on a par with product which he considers available for improving his consumption or increasing his assets. When considerations like these are dominant, it is appropriate to exclude all capital consumption.

Series A 1.—NATIONAL WEALTH—  
TOTAL VALUATION OF ALL THE  
REAL AND PERSONAL PROPERTY IN  
THE UNITED STATES (BLOD-  
GET): 1774 TO 1807

<sup>1</sup> The Census valuation of the wealth of the United States in 1870, which is \$30,068,518,000, has been reduced to a gold basis (Burchard). Bureau of Census Report, *Estimated National Wealth* (compiled as part of the Decennial Report on Wealth, Public Debt, and Taxation), Washington, D. C., 1924, p. 27, gives 24,055 million dollars as 1870 total on gold basis.

Series A 42-74.—NATIONAL WEALTH—ITEMS OF NATIONAL WEALTH, CENSUS BUREAU VALUATIONS: 1880 TO 1922

[In millions of dollars. This table is intended to bring together, in broadly related groupings, the actual observations shown in the source volumes, with minimum disturbance of values and descriptions. The column headings are artificial since they represent composites of the descriptions employed at the various censuses of valuation and wealth. Since total and subtotal series have been treated independently of detail series, details do not always add to totals. Leaders (.....) indicate that the source volume did not report the specified item separately for the given year.]

## Chapter B. Population Characteristics and Migration: (Series B 1-352)

### Population Characteristics: Series B 1-181

#### DECENNIAL SUMMARIES (B 1-23)

**B 1-12. Decennial summary: Aggregate population, for the United States, territories, and possessions, 1790-1940.** SOURCE: Bureau of the Census. For all figures for 1920-1940; continental United States population, 1790-1910; Alaska, 1880-1910; Hawaii, Puerto Rico, and "All other," 1900-1910; and Panama Canal Zone, 1910; see Sixteenth Census Reports, *Population*, vol. I, pp. 6, 1191, 1201, 1205, 1209, 1217, 1221, 1235. For figures for military and naval forces abroad for 1910, see Fifteenth Census Reports, *Population*, vol. I, p. 5; for 1900, see Thirteenth Census Reports, *Population*, vol. I, p. 23. Estimates for Philippine Islands, 1900-1910, are heretofore unpublished. Figures for continental and colonial population, 1610-1780, are from Twelfth Census Special Reports, *A Century of Population Growth, 1790-1900*, p. 9.

The figures for the period 1610-1780 given in series B 12 antedate the first census of the United States in 1790. They represent the considered judgment of a number of eminent scholars and are based on materials ranging from relatively complete enumerations for some of the colonies to fragmentary data such as contemporary local population estimates, militia registrations, tax records, church records, and official vital statistics. For a discussion of these estimates, see Bureau of the Census, Twelfth Census Reports, *A Century of Population Growth, 1790-1900*.

**B 13-23. Decennial summary: Sex, urban-rural residence, and race of the population, continental United States, 1790-1940.** SOURCE: Bureau of the Census. For urban-rural figures for 1790-1940, sex and race figures for 1850-1940, and nativity figures for 1900-1940, see Sixteenth Census Reports, *Population*, vol. II, part 1, pp. 18 and 19; for race figures for 1790-1840, sex figures for 1820-1840, and nativity figures for 1850-1890, see Fifteenth Census Reports, *Population*, vol. II, p. 97; for slave figures for 1790-1860, see Ninth Census Reports, *Population*, p. 7.

In the course of its history the Bureau of the Census has employed several definitions of urban population. The figures shown for the period 1790-1940 are based on the definition of urban population used in 1930 and 1940. The urban population, in general, is the population living in incorporated places having 2,500 inhabitants or more, although a few densely populated unincorporated areas, principally in New England, are classified as urban under special rule. For further details for each State, see vol. I of the 1940 *Population* reports.

In the classification by nativity, a person born in the United States or in any of its territories or possessions is counted as native. Likewise included as native is the small group of persons who, although born in a foreign country or at sea, were American citizens by birth because their parents were American citizens. All other persons are counted as foreign born.

#### AREA AND POPULATION (B 24-30)

**B 24-25. Area: Territorial expansion of the United States, 1790-1940.** SOURCE: Bureau of the Census, *Statistical Abstract of the United States*, 1948, p. 3. Data are derived from records of the Bureau of the Census. The boundaries of all areas comprising continental United States were indefinite, at least in part, at the time of acquisition. Area figures shown here represent precise determination of specific territories which have been marked upon maps, based upon interpretations of the several treaties of cession which are necessarily debatable. See also discussion of series F 1-3 and F 25-27.

**B 26-30. Area and population: Continental United States, decennial, 1790-1940.** SOURCE: Bureau of the Census, *Statistical Abstract*, 1947, p. 5. Data are derived from Bureau of the Census, reports of the Fourteenth, Fifteenth, and Sixteenth Censuses, *Population*, vol. I. In particular, see Sixteenth Census Reports, *Population*, vol. I, p. 6, and also *Areas of the United States, 1940*, pp. 1-3.

Area figures for each census year represent all continental area under jurisdiction of the United States on the indicated dates, including in some cases, considerable areas not then organized or settled, and not covered by the census.

Area figures for 1940 and 1930 are based on the complete re-measurement made for the 1940 census; see Bureau of the Census, Sixteenth Census Reports, *Areas of the United States, 1940*, pp. 1-3. See also series F 1-3 where figures in acres are given on the basis of the previous measurement.

#### SEX, AGE, AND RACE (B 31-144)

**B 31-39. Annual summary: Sex, age, and color of the population, continental United States, 1790-1945.** SOURCE: Bureau of Census. For figures for 1930-1945, see *Population—Special Reports*, Series P-47, No. 3 (April 3, 1947) and Series P-45, No. 5 (April 30, 1945); for color and sex figures for 1900-1916 and 1920-1929, see Sixteenth Census Special Reports, *Vital Statistics Rates in the United States, 1900-1940*, pp. 824-857; and for figures for 1855-1899, see *Statistical Abstract*, 1946, p. 8. The age figures for 1900-1916 and 1920-1929, and all figures for 1917-1919 and 1791-1854 are from unpublished records of the Bureau of the Census. For figures for 1790, see Sixteenth Census Reports, *Population*, vol. I, p. 7.

The methods of estimation of the population statistics shown in series B 31-39 range from simple linear interpolation (for the period 1791-1899) to complex computations for recent decades as data on the components of population change became available. School censuses, State censuses, and other local data indicative of population changes have been used for the period 1900-1919, in conjunction with interpolation of Census figures on age, sex, and color. Life tables, birth statistics, and statistics of civilian immigration and emigration have been used since 1920. Since 1940, actual death statistics by age, sex, and color have been used instead of life tables.

**B 40-47. Nonwhite races, decennial, 1790-1940.** SOURCE: Bureau of the Census. For 1940, see Sixteenth Census Special Reports, *Characteristics of the Nonwhite Population by Race*, p. 5; for 1790-1930, except slaves and free colored, see Fifteenth Census Reports, *Population*, vol. II, p. 32; for figures for slaves and free colored, see Ninth Census Reports, *Population*, pp. 6 and 7.

The returns for Indians are subject to some degree of uncertainty. Prior to 1890 the enumeration of Indians was confined to those found living among the general population of the various States. At the census of 1910 a special effort was made to secure a complete enumeration of all persons having any perceptible amount of Indian blood, and it is probable that this resulted in the enumeration as Indian of a considerable number of persons who would ordinarily have been reported as white. In 1920 no such special effort was made and the returns showed a much smaller number of Indians than in 1910. Again in 1930 emphasis was placed on securing a complete count of persons of Indian blood, and the resulting returns overstated the actual decennial increase in the number of Indians. In 1940 persons of less than one-fourth Indian blood were not counted as Indian unless they were so regarded in the local community.

**B 48-71. Race by regions, decennial, 1790-1940.** SOURCE: Department of Commerce, Bureau of the Census. For 1940, see Sixteenth Census Reports, *Population*, vol. II, part 1, p. 52; for 1930, see Fifteenth Census Reports, *Population*, vol. II, p. 35; for 1920, see Fourteenth Census Reports, *Population*, vol. II, p. 31; for 1900-1910, see Thirteenth Census Special Reports, *Negro Population, 1790-1915*, p. 43; for total population, 1790-1890, see Sixteenth Census, *Population*, vol. I, pp. 14-15; for white and Negro figures, 1790-1800 and 1820-1890, see Thirteenth Census Special Reports, *Negro Population, 1790-1915*, pp. 44-45; for other races, 1860-1890, see Fifteenth Census, *Population*, vol. II, p. 53; for free white and slave population, 1790-1800 and 1820-1860, see Ninth Census, *Population*, vol. I, pp. 4-7. Figures for 1810 have been revised to include in Missouri (a North Central State) that part of the population living in what was formerly part of Louisiana Territory and subsequently Arkansas (a Southern State).

The divisional composition of census regions is given in footnotes to series B 48-71. The State composition of the census divisions is as follows:

NEW ENGLAND:	Virginia
Maine	West Virginia
New Hampshire	North Carolina
Vermont	South Carolina
Massachusetts	Georgia
Rhode Island	Florida
Connecticut	
MIDDLE ATLANTIC:	EAST SOUTH CENTRAL:
New York	Kentucky
New Jersey	Tennessee
Pennsylvania	Alabama
	Mississippi
EAST NORTH CENTRAL:	WEST SOUTH CENTRAL:
Ohio	Arkansas
Indiana	Louisiana
Illinois	Oklahoma
Michigan	Texas
Wisconsin	
WEST NORTH CENTRAL:	MOUNTAIN:
Minnesota	Montana
Iowa	Idaho
Missouri	Wyoming
North Dakota	Colorado
South Dakota	New Mexico
Nebraska	Arizona
Kansas	Utah
	Nevada
SOUTH ATLANTIC:	PACIFIC:
Delaware	Washington
Maryland	Oregon
District of Columbia	California

**B 72-80. Median age, by color and sex, decennial, 1790-1940.** SOURCE: Bureau of the Census, Sixteenth Census Reports, *Population*, vol. IV, part 1, p. 3. The median age may be defined as that age which divides the population into two equal groups—one-half being older and one-half younger than the median. The median age is ordinarily 1 or 2 years younger than the average or mean age of the population. All median ages in series B 72-80 have been computed on the basis of 5-year intervals, except those for censuses earlier than 1840.

**B 81-144. Age and race, decennial, 1790-1940.** SOURCE: Bureau of the Census. For 1930-1940, see Sixteenth Census Reports, *Population*, vol. II, part 1, p. 22; for 1880-1920, see Fifteenth Census Reports, *Population*, vol. II, pp. 576, 578, and 580; for 1870, see Ninth Census Reports, *Vital Statistics*, pp. 552-553; for 1860, see Eighth Census Reports, *Population*, pp. 594-595, and Ninth Census Reports, *Vital Statistics*, p. 555; for 1850, see *Seventh Census of the United States*, Appendix, pp. xlii-xliv; for 1790-1840, figures are from reports of the first six population censuses and revisions on record in the Bureau of the Census.

#### URBAN-RURAL AND FARM RESIDENCE (B 145-181)

**B 145-159. Urban size-groups and rural territory, decennial, 1790-1940.** SOURCE: Bureau of the Census; Sixteenth Census Reports, *Population*, vol. I, p. 26-27. State-boundary places have been treated as follows: In 1940 Bluefield, Va., and Bluefield, W. Va.; Bristol, Tenn., and Bristol, Va.; Texarkana, Ark., and Texarkana, Tex.; and Union City, Ind., and Union City, Ohio, were counted as separate incorporated places, whereas in 1930 and earlier years each pair was counted as a single place. With the exception of Union City, Ohio, each of these places was urban in 1940. If

the 1930 treatment had been applied in 1940, there would have been 3 fewer urban places (2 fewer in each of the groups 2,500 to 5,000 and 10,000 to 25,000, and 1 more in the group 25,000 to 50,000). For method of urban-rural classification, see text of series B 13-23.

**B 160-164. Rural size-groups, decennial 1890-1940.** SOURCE: Bureau of the Census, Sixteenth Census Reports, *Population*, vol. I, p. 26. State-boundary places have been treated as follows: In 1940, Delmar, Del., and Delmar, Md.; Harrison, Ohio, and West Harrison, Ind.; Junction City, Ark., and Junction City, La.; Texhoma, Okla., and Texhoma, Tex.; and Union City, Ind., and Union City, Ohio, were counted as separate incorporated places, whereas in 1930 and earlier years each pair was counted as a single place. With the exception of Union City, Ind., each of these places was rural in 1940. If the 1930 treatment had been applied in 1940, there would have been five fewer rural incorporated places (all in the group of less than 1,000 inhabitants). For method of urban-rural classification, see text of series B 13-23.

**B 165-170. Farm and nonfarm, urban and rural, decennial 1910-1940.** SOURCE: Bureau of the Census. For 1920-1940, see Sixteenth Census Reports, *Population*, vol. II, part 1, p. 18; for 1910 farm population, see Fourteenth Census, Census Monographs VI, *Farm Population of the United States, 1920*, p. 45; figures for 1910 nonfarm population have been derived by subtraction of the estimate for the farm population from the figure for total population.

The farm population for 1930 and 1940 comprises all persons living on farms, without regard to occupation. The farm population figures for 1920 include, in addition, those farm laborers and their families living in rural territory outside the limits of an incorporated place. The farm population of 1910 is estimated from data on (1) the number of farms in 1910, (2) the average farm population per farm in 1920, and (3) the change in the average number of persons per family in the rural population between 1910 and 1920. For method of urban-rural classification, see text of series B 13-23.

**B 171-181. Families, by farm residence, race and sex of head, decennial, 1790-1940.** SOURCE: Bureau of the Census. For 1940 figures on number of families by farm residence, race and sex of head, see Sixteenth Census Reports, *Population*, vol. IV, part 1, p. 26, and Sixteenth Census Special Reports, *Population—Characteristics of the Nonwhite Population by Race*, p. 30; for 1890-1930 figures on number of families by farm residence and race of head, and 1930 figures on sex of head, see Sixteenth Census Special Reports, *Families—General Characteristics*, pp. 4 and 32; for 1790-1940 figures on population used in computing population per family, see Sixteenth Census Reports, *Population*, vol. I, p. 6; for 1930-1940 median size of family, 1940 and 1890 median age of head, and 1930 figures on age of head, see Sixteenth Census Special Reports, *Families—Size of Family and Age of Head*, pp. 3 and 123; for 1900 figures on size of family, and sex and age of head, see Twelfth Census Reports, *Population*, vol. II, part 2, pp. ccviii, ccx, and 611; for 1890 figures on size of family and 1850-1880 figures on number of families, see Eleventh Census Reports, *Population*, part I, pp. 914 and 951; for 1890 figures on sex of head, see Eleventh Census Reports, *Farms and Homes: Proprietorship and Indebtedness*, p. 172; for 1790 figures on number and size of families, see Twelfth Census Special Reports, *A Century of Population Growth, 1790-1900*, pp. 96 and 98.

The term "family" as defined by the Census in 1940 and 1930 is limited to private families and excludes the small number (about 80,000 in 1940) of institutions and other quasi households. A private family comprises the head of a private household and all other persons in the household, if any, who are related to the head by blood, marriage, or adoption, and who live together and share common housekeeping arrangements. Lodgers and other non-relatives are counted as household members but not as family members. A person living alone is counted as a one-person family.

Prior to 1930, with the exception of 1900 and 1790, a family was defined as any group of persons sharing a common abode, or a person living alone. Institutions and other quasi households were counted as families. In 1900 and 1790, families were limited to private families, but family members included, in addition to the head and his relatives, any lodgers and other nonrelatives who lived in the home.

After the copy for this volume had been set in type, the Bureau of the Census made extensive revisions in its concepts relating to families. According to these changes, the number of families, as shown in the present report, would be referred to as the number of households; and the median size of family, as the median number of related persons in the household.

### Internal Migration: Series B 182-236

**B 182-230. General note. Interstate movement of native population and number of the foreign born, decennial, 1850-1940.** SOURCE: Bureau of the Census. Data are largely from Sixteenth Census Special Reports, *Population—State of Birth of the Native Population*. See detailed listings below.

In general, the data relate to the native population of the United States, except that series B 182 (total population) and B 193-194 (foreign born) are included to complete the distribution of the entire population according to birthplace. In the classification by nativity, a person born in continental United States or in any of its territories and possessions is counted as a native. Also included as native is the small group of persons who, although born in a foreign country or at sea, were American citizens at birth because their parents were American citizens. However, series B 195-230 relate only to persons born within the limits of continental United States for whom information on State of birth was obtained.

These Census tabulations as to State of birth are of value mainly for the light they throw upon the historical movement of the native population from one place to another within the United States from the time of birth to the time of the given census. Extreme care is necessary in the use of the figures as representing or measuring migration; these figures indicate only the net result of migration during the widely differing periods of life of the persons who were enumerated.

In respect to migration, these figures take into account only those persons who have moved from one State to another and are, on the census date, living in States other than those in which they were born. Hence, the statistics provide no indication of the amount of migration within a given State from rural to urban communities or from one location to another; nor do they take any account of intermediate moves between the time of a person's birth and the time of the census. The statistics thus do not indicate the total number of persons who have moved from the region or State in which they were born to other regions or States, or to any specific region or State, during any given period of time. From one census date to another, some of those who had gone from one State to another died before the following census date, others had returned to the State in which they had been born, and still others had gone to still other States or to places outside the boundaries of continental United States.

The net gain or loss through intersectional or interregional movement (series B 204, 214, 222, 230) represents the difference on the census date between the total number of surviving native persons who had moved out of the specified area since they were born and the total number of surviving native persons who had moved into the specified area since they were born. Some of these persons are the survivors of groups who departed from, or arrived in, the given area half a century or more before the census was taken. The figures, therefore, do not represent migration in the sense of the number of persons coming and going during the preceding census decade or during any other specific period in time.

**B 182-194. Interstate movement of native population and number of the foreign born, decennial, 1850-1940.** SOURCE: Bureau of the Census, Sixteenth Census Special Reports, *Population—State of Birth of the Native Population*, p. 4. See general note for series B 182-230, above.

**B 195-204. East-west movement of the native population, decennial, 1870-1940.** SOURCE: Same as for series B 182-194, above. Also, see general note, series B 182-230, above.

**B 205-214. North-south movement of the native population, decennial, 1870-1940.** SOURCE: Same as for series B 182-194, above.

**B 215-230. Interregional movement of the native white and nonwhite population, decennial, 1890-1940.** SOURCE: Bureau of the Census. For 1940, see Sixteenth Census Special Reports, *Population—State of Birth of the Native Population*, p. 6; 1930 figures have been derived from Fifteenth Census Reports, *Population*, vol. II, pp. 153-162, plus unpublished and partly estimated data for persons classified as Mexican in that census; 1920 figures have been derived from Fourteenth Census Reports, *Population*, vol. II, pp. 626-635; 1910 figures have been derived from Thirteenth Census Reports, *Population*, vol. I, pp. 730-739; 1900 figures have been derived from Twelfth Census Reports, *Population*, vol. I, part 1, pp. 686-693; 1890 figures derived from Eleventh Census Reports, *Population*, part I, pp. 560-567. See general note for series B 182-230; also for method of classification by nativity, see text of series B 13-23.

**B 231-236. Movement of farm population, 1910, 1920-1940.** SOURCE: Department of Agriculture. For 1945, see *Farm Population Estimates, United States and Major Geographic Divisions, 1940-1945; States, 1940-1945*, Bureau of Agricultural Economics, August 1945 (mimeographed); for 1929-1944, see *Agricultural Statistics, 1946*, p. 528; for 1910-1928, see *Agricultural Statistics, 1942*, p. 643.

The estimates in series B 231-236 are based on bench-mark data from the Censuses of Population and Agriculture, current enumerative surveys, and mailed questionnaires returned by farmers. For January 1944 and later dates the estimates are adjusted to the level of farm population of the United States as estimated jointly by the Bureau of the Census and the Bureau of Agricultural Economics on the basis of enumerative surveys and published in the Census-BAE series. Estimates of changes in the farm population 1930-1941 were revised in September 1942; estimates of changes during 1942 were revised in November 1944; estimates of changes during 1945 were revised in August 1947. For method of classification of farm population, see text of series B 165-170. Positive entries in series B 236 indicate a net gain in farm population due to the beginning of farming operations on units that had previously not been classified as farms, while negative entries represent net loss due to the cessation of farming operations on such units.

### Citizenship Status and Country of Birth: Series B 237-303

**B 237-278. Citizenship status of the population (Census), decennial, 1890-1940.** SOURCE: Department of Commerce, Bureau of the Census. For figures for all years for total, native, and total foreign-born population, for citizenship status of foreign born, 1930-1940, and for all data on persons 21 years old and over, 1930-1940, see Sixteenth Census Reports, *Population*, vol. II, part 1, pp. 19, 30-33; for 1920 figures on citizenship status of the foreign born, and for persons over 21 years old, 1890-1920, see Fifteenth Census Reports, *Population*, vol. II, p. 405.

The Census classification in regard to citizenship embraces, first, the two major categories, citizen and alien. Citizens are subdivided into native and naturalized. The aliens are subdivided into those having first papers (that is, having made formal declaration of intention to become citizens of the United States) and those not having first papers. In addition to the citizen and

alien categories, there is a third group made up of foreign-born persons for whom no report on citizenship was obtained, designated as "citizenship not reported" or "unknown citizenship." Since it is likely that most of these persons are aliens, they are often included in summary figures for total aliens. The population 21 years old and over is also given separately by citizenship, in order to show the number of potential voters.

These statistics relate to the citizenship status of the population at the time of the given census. In respect to those naturalized or in the process of naturalization, see also series B 337-349 which present figures on the number of aliens who file declarations or petitions, or who become naturalized each year.

**B 279-303. Country of birth of the foreign-born population (Census), decennial, 1850-1940.** SOURCE: Department of Commerce, Bureau of the Census; Sixteenth Census Reports, *Population*, vol. II, part 1, p. 43.

All classifications of the 1940 population according to country of birth are based on the political boundaries of January 1, 1937. The 1930 classification is based on the political boundaries of that year; in most respects, these were identical with those of January 1, 1937. Nevertheless, some persons born in central Europe or the Balkans apparently reported birthplace in terms of national boundaries existing either at the time of their birth or in 1940. This tendency probably accounts for increases, shown in the source volume, in the number of foreign-born whites native to Austria, Hungary, and Turkey, and for greater than expected decreases in the number native to countries created or enlarged just after World War I. Although the major changes are indicated in table 15 of the source volume (*Population, 1940*, vol. II, part 1, p. 43), there is some lack of comparability between the figures for the last two censuses and those for earlier censuses, when boundaries were often different. For the censuses from 1850 to 1900, country of birth is shown in the source volume for the total foreign-born population; beginning in 1910, this item was tabulated for foreign-born white only. For most purposes, however, the data may be regarded as comparable.

The composition of the broad regions shown in series B 281-303, in terms of countries existent January 1, 1937, is as follows: *Northwestern Europe*: England, Scotland, Wales, Ireland (comprising Northern Ireland and Eire), Scandinavia (comprising Norway, Sweden, Denmark, and Iceland), Netherlands, Belgium, Luxembourg, Switzerland, and France. *Central Europe*: Germany, Poland, Czechoslovakia, Austria, Hungary, and Yugoslavia. *Eastern Europe*: U. S. S. R. (Russia), Latvia, Estonia, Lithuania, Finland, Rumania, Bulgaria, Turkey in Europe. *Southern Europe*: Greece, Italy, Spain, Portugal. *Other Europe*: Albania, Danzig, and "Europe not specified." *Asia*: Palestine, Syria, Turkey in Asia, "Other Asia." *America*: Canada-French, Canada-Other, Newfoundland, Mexico, Cuba, "Other West Indies," Central America, South America. *Other countries*: Australia, Azores, "Other Atlantic Islands," "Born at sea," and "All other and not reported."

### Immigration, Emigration, and Naturalization: Series B 304-352

**B 304-352. General note.** Although the reporting of alien arrivals was required at an early date in certain of the colonies and original States, the continuous record of immigration to the United States begins with the fiscal year ending September 30, 1820. The number of immigrants arrived in the United States from the close of the Revolutionary War up to 1820 has been estimated at 250,000 (Bureau of Statistics, Treasury Department, *Monthly Summary of Commerce and Finance of the U. S.*, No. 12, series 1902-1903, p. 4336). Under the act of March 2, 1819, passenger lists for all vessels arriving from foreign places were required to be delivered to the local collector of customs, copies transmitted to the Secretary of State, and the information reported to Congress.

Immigration statistics were compiled by the Department of State from 1820 to 1874 and by the Bureau of Statistics of the Treasury Department from 1867 to 1895. Since 1892 there has been a separate Office or Bureau of Immigration, now a part of the Immigration and Naturalization Service. Annual reports were issued by this Bureau from 1892 to 1932. From 1933 to 1940, a summary of the work of the Immigration and Naturalization Service was given in the *Annual Reports of the Secretary of Labor*. For 1941, the *Annual Report of the Attorney General* contained the report on immigration and naturalization. No report was published for 1942. For subsequent fiscal years, *Annual Reports of the Immigration and Naturalization Service* (submitted by the Commissioner to the Attorney General) were published in mimeographed form.

Since 1820 the official immigration statistics have changed considerably in completeness and in the basis of reporting. From 1820 to 1850 the reports were for arrivals at the Atlantic and Gulf ports only. Reports for Pacific ports were first included in 1850. There existed, practically speaking, no inspection along the frontiers prior to October 1893; it is ascertained from Canadian sources that from 40,000 to 50,000 Europeans entered the United States who landed at Quebec and Halifax during 12 months preceding that date (Treasury Department, *Annual Report of the Superintendent of Immigration*, 1894, p. 19). Statistics of European immigrants arriving in Canada destined to the United States have been available since 1894, and until the fiscal year 1930 were shown in the port tables as arriving at Canadian-Atlantic and Canadian-Pacific ports. Beginning with the fiscal year 1930, such arrivals have been shown at the actual United States ports of entry. Arrivals in Hawaii were first reported in 1901, in Puerto Rico in 1902, and in Alaska in 1904. Until January 1, 1903, only steerage or third-class passengers were counted as immigrants, and cabin passengers or aliens who traveled first or second class were omitted.

Entries of Canadians and Mexicans by land border were first reported in 1906. The fiscal year 1908 is, however, the first complete year for which immigration via the land borders was recorded, since Canadians and Mexicans were not inspected until the passage of the Act of February 20, 1907 (34 Stat. 898). From 1919 the figures for the Mexican border are available separately for Mexican border seaports and Mexican land border. Since 1939 the Mexican border seaports have been recorded as Los Angeles District, San Pedro and San Diego seaports.

Not all aliens arriving at the Canadian and Mexican border ports are counted in immigration statistics. Prior to the fiscal year 1931, all aliens arriving at Canadian or Mexican border land ports from foreign countries were counted in statistics, except residents of a year or longer of Canada, Newfoundland, or Mexico who planned to remain in the United States less than 6 months. On June 23, 1930, the definition of "statistical" aliens seeking to enter at ports along the international land borders was changed to comprise:

(1) Those who have not been in the United States within 6 months, who come to stay more than 6 months; (2) those for whom straight head tax is a prerequisite to admission, or for whom head tax is specially deposited and subsequently converted to straight head tax account; (3) those required by law or regulation to present an immigration visa or reentry permit, and those who surrender either, regardless of whether they are required by law or regulation to do so; (4) those announcing an intention to depart via a seaport of the United States for Hawaii or insular possessions of the United States, or for foreign countries, except arrivals from Canada intending to return thereto by water; (5) those announcing an intention to depart across the other land boundary.

The above classification was again changed in the fiscal year 1945. Statistics of arriving aliens at border ports of entry now include (1) arriving aliens who come into the United States for 30 days or more; and (2) returning alien residents who have been out of the United States more than 6 months. Arriving aliens who

come into the United States for 29 days or less are not counted except those certified by public health officials, aliens held for a board of special inquiry, aliens excluded and deported, and aliens in transit who announce an intention to depart across another land boundary, or by sea.

Separate figures are kept by the Immigration Service on alien and citizen border crossers (not included above).

Arrivals in and departures from the Philippine Islands were recorded in the port tables from 1910 to 1924, inclusive, but were not included in the total immigration figures. From 1925 to 1931, inclusive, arrivals in and departures from the Philippine Islands were published in separate tables from data obtained annually from the Bureau of Insular Affairs, War Department. The Immigration Service has had no records since 1932 of arrivals in, or departures from, the Philippine Islands to foreign countries.

Data on aliens admitted to the continental United States from insular possessions have been compiled since 1908 but are not included in the total immigration figures. Aliens admitted from Hawaii and Puerto Rico have been reported continuously since 1908. Aliens admitted from the Philippine Islands were reported from 1908 to April 30, 1934. All arrivals from and departures to the Philippine Islands have been, since May 1, 1934, recorded as, and included with, data from other foreign countries. Aliens admitted from the Virgin Islands have been recorded since 1917. The departure of aliens from the mainland, Hawaii, and Puerto Rico was first recorded in 1918. Records are available since 1918 of aliens passing between insular possessions. Figures for aliens from Guam are available since 1929; Samoa, since 1932. Records of United States citizens' arrival in continental United States from insular possessions, and in insular possessions from continental United States and other insular possessions, are available since 1920.

**Definition of terms.** From 1820-1867 the immigration figures relate to alien passengers. From 1868 to 1891, inclusive, and 1895 to 1897, inclusive, the data relate to immigrant aliens arrived; from 1892 to 1894, inclusive, and from 1898 to the present time, to immigrant aliens admitted or aliens intending to make their permanent residence in this country. See Bureau of Statistics, Treasury Department, *Monthly Summary of Commerce and Finance of the U. S.*, No. 12, series 1902-1903, p. 4336. In the fiscal year 1906 aliens arriving were segregated into two classes; that is, (1) *immigrant aliens*, or those who intended to settle here, and (2) *nonimmigrant aliens*, or aliens admitted who avowed an intention not to settle in the United States, and all returning to resume domiciles formerly acquired in this country. See *Annual Report of Commissioner General of Immigration*, 1906, pp. 4 and 45.

No official record of *emigration* was kept prior to July 1, 1907. The keeping of these figures was made possible by a provision in Section 12 of the Immigration Act of February 20, 1907, requiring all steamship companies carrying alien passengers out of the country to furnish manifests similar to those required in the case of arriving aliens.

From 1908 to 1932, inclusive, aliens arriving in or departing from the United States were classified as follows:

Arriving aliens whose permanent domicile has been outside the United States who intend to reside permanently in the United States were classed as *immigrant aliens*; departing aliens whose permanent residence has been in the United States who intend to reside permanently abroad were classed as *emigrant aliens*; all alien residents of the United States making a temporary trip abroad and all aliens residing abroad making a temporary trip to the United States were classed as *nonimmigrant aliens* on the inward journey and *nonemigrant aliens* on the outward. The preponderance of nonemigrant over nonimmigrant aliens is due largely to the fact that many on arrival who intend to reside permanently change their minds and leave after a temporary residence only. (*Annual Report of the Commissioner General of Immigration*, 1908, p. 6.) Since 1908 permanent residence has been defined as a residence of 1 year or longer.

The above definitions for *nonimmigrant aliens* and *nonemigrant aliens* were stated more clearly in the fiscal years 1924-1932 in the following terms:

*Nonimmigrant aliens* are aliens returning from a temporary visit abroad and those who enter the United States for a temporary stay only. *Nonemigrant aliens* are resident aliens who go abroad for a temporary stay or who leave the country after a temporary sojourn here.

From 1933 to the present time, aliens arriving in or departing from the United States have been classified as follows:

An *immigrant alien* is a nonresident alien admitted to the United States for permanent residence. Immigrants have been further classified as: *Quota immigrants*, or those admitted under established quotas from European countries, Asia, Africa and the Pacific, and colonies, dependencies, and protectorates of European countries; and *nonquota immigrants*, i. e., natives from the independent countries of the Western Hemisphere, their wives and unmarried children under 18 years of age; wives, husbands, and unmarried children of citizens of the United States; ministers and professors who enter to carry on their professions and their wives and children; and others.

A *nonimmigrant alien* is an alien resident of the United States returning from a temporary visit abroad, or nonresident alien admitted to the United States for a temporary period. Included in this group are visitors, transients, treaty merchants, students, foreign government officials, officials to international organizations, and the wives and unmarried children of these groups. Travelers between the United States and insular possessions are not included in the count of nonimmigrants, nor are commuters and others who frequently cross the international land boundaries. In general, aliens admitted to the United States at land boundaries for 30 days or more are included in the statistics. Agricultural laborers admitted to the United States under the Act of April 29, 1943, as amended, have been included in the statistics if they came from the West Indies. However, agricultural and railway track laborers admitted from Mexico have not been included in the statistics as nonimmigrants.

*Emigrants* are aliens who have resided in the United States for a year or longer and who are leaving the United States for a permanent residence abroad. *Nonemigrants* are resident aliens of the United States who are leaving the United States for a temporary period abroad, or nonresident aliens of the United States who have been in the United States for a temporary period, and who are returning to permanent residence abroad.

The statistical definition of immigrant resembles closely the legal definition, but differs in several respects. Under the law, returning residents and students are classed as nonquota immigrants, whereas in statistics they are defined as nonimmigrants since they enter the United States for a temporary period, and returning residents have been counted on first entry as immigrants. Likewise, under the law all Spanish subjects admitted into Puerto Rico (Act of May 26, 1926) and American Indians born in Canada are classed as immigrants not chargeable to any quota. Under the statistical definition, such persons are nonimmigrants if admitted for temporary residence, and immigrants if admitted for permanent residence.

The distinctions in the definitions of immigrant and emigrant, nonimmigrant and nonemigrant, have to some extent impaired the reliability of net immigration figures. While an immigrant alien is admitted for permanent residence, he may change his mind and depart prior to residence of 1 year, in which case he is counted as an immigrant alien on arrival and a nonemigrant alien on departure. An alien who comes for a temporary visit and fails to depart within a year is classed as a nonimmigrant on arrival and an emigrant on departure.

#### IMMIGRATION BY COUNTRY (B 304-330)

**B 304-330.** Immigrants by country, 1820-1945. SOURCES: For 1820-1903, see Treasury Department, Bureau of Statistics, *Monthly Summary of Commerce and Finance of the U. S.*, No. 12, series 1902-1903, pp. 4345-4357. For 1904-1932, see *Annual Reports of the Commissioner General of Immigration* as follows: For 1891-1926, see *Report for 1926*, pp. 170-178; for 1927-1931, see

*Report* for 1931, pp. 222-223; for 1932, see *Report* for 1932, pp. 120-125; for 1933-1945, data were obtained from unpublished records of the Immigration and Naturalization Service.

Data for years prior to 1906 cover countries whence the aliens came, and for years following, countries of last permanent residence. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. The principal changes in reporting immigrants by country since 1820 are shown in the detailed listings below.

**B 305-316. European immigration, 1820-1945.** SOURCE: See text of series B 304-330. Since 1820, territorial transfers in Europe have to a certain extent impaired the comparability of immigration statistics from that continent. Data for Austria-Hungary were not reported until 1861. Austria and Hungary have been reported separately since 1905. In the years 1938-1945, inclusive, Austria is included with Germany. Bulgaria, Serbia, and Montenegro were first reported in 1899. In 1920 Bulgaria was reported separately and separate enumeration made for the Kingdom of Serbs, Croats, and Slovenes. Since 1922, the Serb, Croat, and Slovene Kingdom has been recorded as Yugoslavia. Prior to 1925 Northern Ireland was included with Ireland (Eire). The figures for Norway and Sweden were combined from 1820 to 1868, but since 1869 each country has been reported separately. Poland was recorded as a separate country from 1820 to 1898 and from 1920 to 1945. Between 1899 and 1919 Poland was included with Austria-Hungary, Germany, and Russia. There is no record of immigration from Rumania prior to 1880. For detailed data for each of the aforementioned countries, see sources indicated for series B 304-330, above. For clarification of column groupings of countries, consult footnotes shown in the tabular presentation of these series.

International transfers in territory following the World War I resulted in the establishment of several new countries. In 1920, Czechoslovakia, Finland, Poland, and the Kingdom of Serbs, Croats, and Slovenes were added to the immigration lists. In 1924 Albania, Estonia, Latvia, and Lithuania were added to the lists of European countries. In 1925 the Free City of Danzig and Luxembourg were added.

The Immigration Act of May 26, 1924, which established quotas for all independent countries in Europe, Asia, Africa, and the Pacific has effected a further change in the immigration lists of countries. This change, however, was not fully felt until the fiscal year 1931. In that year Andorra, Iceland, Liechtenstein, Monaco, and San Marino were added to the European countries, and the Russian Empire was classified into European Russia and Siberia, or Asiatic Russia. The principal effect of the 1924 Act, however, was in the extension of the lists of Asiatic, African, and Western Hemisphere countries.

**B 317-321. Asiatic immigration, 1820-1945.** SOURCE: See text of series B 304-330. China and India are the only countries in Asia for which the records of immigration to the United States date back to 1820. Although there is record of a few immigrants from Japan in 1861, 1866, and 1867, there are no complete records of immigration to the United States from Japan prior to 1869. Figures for Turkey in Asia are available since 1869. Data on some immigration from Arabia are recorded in the years 1876-1895; from Armenia in 1874-1895; and from Persia in 1871-1895. From 1896 to 1923, inclusive, Asiatic immigration included only China, India, Japan, Turkey in Asia, and "Other Asia." In 1924 Syria was added, and in 1925 Armenia, Palestine, and Persia (Iran) were added to the lists of Asiatic countries. Since 1934 Armenia has been included in Russia. In 1931 Siberia, or Asiatic Russia, was separated from European Russia, and Iraq and Siam (Thailand) were added to the lists.

In 1945 the immigration statistics by country of last permanent residence were made comparable to country of birth tables which

are based on the Quota Law. This change consisted in the addition to the immigration lists of Afghanistan, Arabian Peninsula, Bhutan, Muscat, Nepal, Saudi Arabia, and Asiatic colonies, dependencies, and protectorates of European countries.

**B 322-325. Immigration from America, 1820-1945.** SOURCE: See text of series B 304-330. Prior to 1920 Canada and Newfoundland were recorded under country of last permanent residence as British North America. Combined figures are available for Canada and Newfoundland from 1920 to 1924; since 1925 each country has been reported separately.

Statistics of European immigrants arriving in Canada en route to the United States have been available since 1894. From 1894 to 1906, inclusive, the data refer principally to European aliens arriving at Canadian Atlantic and Pacific ports en route to the United States. Inspection of Canadians and Mexicans was first authorized by the Act of February 20, 1907 (34 Stat. 898). The fiscal year 1908 is, therefore, the first complete year for which all immigration via the land borders was recorded.

Immigration from Mexico has been recorded from 1820 to 1885 and from 1894 to 1945. Immigration from the West Indies has been available since 1820. Between 1820 and 1860 there was no classification of the West Indies, by countries. For 1860-1898, some immigration was recorded from Antigua (1873-1895), Bahamas (1871-1895), Barbados (1869-1895), Bermuda (1861-1895), Cuba (1869-1898), Curaçao (1873-1895), Haiti (1869-1895), Jamaica (1869-1895), Puerto Rico (1869-1895), Saint Croix (1871-1895), Saint Thomas (1872-1895), and Trinidad (1874-1895). From 1899 to 1924, inclusive, there again was no classification by country of immigration from the West Indies. Immigration from Cuba has been separately recorded since 1925; from the British West Indies, Dominican Republic, Dutch West Indies, French West Indies, and Haiti since 1931; and from Bermuda since 1945. For detailed data, see *Annual Report of Commissioner General of Immigration* for each year, 1892-1932.

Immigration from Central America has been recorded since 1820, but there was no classification by country during most of that period. Separate statistics are available from 1895 to 1898, inclusive, for Guatemala, Honduras, Nicaragua, and Salvador; and from 1895 to 1897, inclusive, for Costa Rica. Separate enumeration for British Honduras was also made in the years 1874-1910, inclusive. With the above exceptions, only figures for total immigration have been available from Central America up until 1925. Immigration from British Honduras has been reported separately again since 1925, and immigration from the Canal Zone, Costa Rica, Guatemala, Honduras, Nicaragua, Panama, and Salvador has been enumerated separately since 1931.

Immigration from South America has also been reported in total since 1820 but, with the following exceptions, no breakdown by countries was available prior to 1925. Between 1869 and 1895 separate enumerations were made for Brazil, Chile, Colombia, Ecuador, Guiana, Peru, and Venezuela; and between 1871 and 1895 for the Argentine Republic. Separate figures for Brazil have been again available since 1925; and since 1931 for Argentina, Bolivia, British Guiana, Dutch Guiana, French Guiana, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, and Venezuela.

**B 326. Immigration from Africa, 1820-1945.** SOURCE: See text of series B 304-330. Immigration from Africa has been recorded since 1820, but, with few exceptions, was not classified by countries until 1931. There is record of some immigration from Liberia in 1829, 1839, 1844, and 1857-1893; Algeria in 1872-1894; Egypt, 1869-1895; and South Africa, 1869-1895. From 1890 to 1924, only immigration for continental Africa was reported. Immigration from Egypt was again recorded in 1925. Immigration from Ethiopia (Abyssinia), Liberia, Morocco, and Union of South Africa, has been recorded since 1931. In 1945 "Other Africa" was classified into Cameroons (British Mandate), Cameroons (French Mandate), Ruanda and Urundi (Belgian Mandate), South-West Africa (Man-

date of the Union of South Africa), Tanganyika Territory (British Mandate), Togoland (British Mandate), Togoland (French Mandate), and colonies, dependencies, or protectorates of Belgium, France, Great Britain, Italy, Portugal, and Spain.

**B 327-329. Immigration from Australasia, 1870-1945. SOURCE:** See text of series B 304-330. Immigration from Australia was recorded separately in 1822, 1839-1840, and in most of the years 1854-1898. From 1899 to 1924 a combined total was recorded for Australia, Tasmania, and New Zealand, and since 1925 Australia has been again reported separately. Separate figures for New Zealand are available from 1870 to 1890. From 1891 to 1893 New Zealand was included in "All other countries"; from 1894 to 1898 in "Pacific Islands, not specified," and from 1899 to 1924 with Australia and Tasmania. Separate figures for New Zealand have again been available since 1925.

The following countries were added to the immigration lists of the Pacific in the fiscal year 1945: Nauru (British Mandate); Territory of New Guinea including appertaining islands (Australian Mandate); Western Samoa (New Zealand Mandate); Yap and other Pacific islands, under Japanese mandate; and colonies, dependencies, or protectorates of France, Great Britain, Japan, Netherlands, and Portugal.

#### AGE OF IMMIGRANTS (B 331-336)

**B 331-336. Age of immigrants, 1820-1945. SOURCES (B 331, B 333-336):** For 1820-1897, see Treasury Department, Bureau of Statistics, *Monthly Summary of Commerce and Finance of the U. S.*, No. 12, series 1902-1903, pp. 4358 and 4362; for 1898-1932, see *Annual Report of the Commissioner General of Immigration* for each year; for 1933-1945, data are from Immigration and Naturalization Service records. **SOURCES (B 332):** For 1820-1910, see Senate Doc. No. 756, 61st Congress, *Reports of the Immigration Commission*, vol. 3, pp. 6 and 7; for 1911-1931, *Annual Report of the Commissioner General of Immigration*, 1931, p. 238; for 1932, see same, 1932, p. 58; for 1933-1945, data are from Immigration and Naturalization Service records.

Differences between the totals in series B 304 and series B 331 for the years 1820-1868 may be due to the fact that the source of statistics was different. Data for series B 333-335 and subtotals of B 331 are from p. 4358 of the source; data for series B 304 are from p. 4336 of the source.

The age groups of immigrants have changed a number of times since 1820, thereby impairing to a certain extent their comparability. From 1820 to 1898 immigrants to the United States were classified into the following age groups: *Under 15 years, from 15 to 40, and over 40 years*. In addition, the age of nearly 250,000 immigrants, or 4 percent of the total immigrants in the years 1820-1866, was not reported.

Between 1899 and 1917 the age classification was changed to: *Under 14 years, 14-44 years, and 45 years and over*. From 1918 to 1924 the age classification was changed to *Under 16 years, 16-44 years, and 45 years and over*.

Although only three age groups were used prior to 1925, a separate and more detailed classification was used in the years 1910-1924 for single females: *15-19 years, 20-24 years, 25-29 years, and 30-34 years* in 1910; *14-21 years, 22-29 years, 30-37 years, and 38-44 years* in 1911-1917, inclusive; *16-21 years, 22-29 years, 30-37 years, and 38-44 years*, from 1918 to 1924, inclusive.

In 1925 the age classification was enlarged from three to six groups: *Under 16 years, 16-21 years, 22-29 years, 30-37 years, 38-44 years, and 45 years and over*. In 1940 the age classification was again enlarged to 12 groups, with a lower limit of *Under 11 years*, 5-year age groups until 60, and an upper limit of *Over 60 years*. In 1945 the age groups were further enlarged into 5-year

groups, with a lower age limit of *Under 5 years* and an upper open end limit of *100 years and over*. See *Annual Report of the Commissioner General of Immigration* for separate years.

Although the Act of 1819 required that arriving immigrants be recorded by sex, no satisfactory compilation of these data prior to the year 1869 has been made. See Senate Doc. No. 756, 61st Congress, *Reports of the Immigration Commission*, vol. 3, p. 5. The earlier reports of the Secretary of State to Congress, however, contain partial data on this subject, and in 1911 the Immigration Commission compiled such data to show the approximate sex distribution from 1820 to 1867, inclusive. This compilation is made on the basis of years ending June 30 during the period under consideration, and consequently cannot be compared with the annual immigration from 1820 to 1867 as shown in series B 304 since the last mentioned data are for entirely different fiscal years. Therefore the percentages given in series B 332 cannot be reduced to numbers. Moreover, the data are not complete, as in most years during the period a considerable number of immigrants were admitted for whom sex was not reported; but on the whole the percentages may be accepted as fairly representative of the sex distribution in the years considered.

#### NATURALIZATION OF ALIENS (B 337-349)

**B 337-349. General note. Naturalization of aliens.** Prior to 1906, individual courts kept records of naturalizations but no national data were compiled. The Act of June 29, 1906, effective September 27, 1906, provided for periodic returns by all courts conducting naturalization proceedings, and for the filing with a central Federal agency of a duplicate copy of each declaration of intention and petition of naturalization filed, and of each certificate of naturalization issued. This made possible the accurate compilation of naturalization statistics. From 1907 to 1912 naturalization statistics were compiled by the Bureau of Immigration and Naturalization, Department of Commerce and Labor. From 1913 to 1932 naturalization statistics were compiled by the Commissioner of Naturalization, Bureau of Naturalization, Department of Labor. From 1933 to 1940, a summary of the naturalization work was given in the *Annual Reports of the Secretary of Labor*. For 1941 the *Annual Report of the Attorney General* contained a report on naturalization. No report was published in 1942. For subsequent fiscal years, *Annual Reports of the Immigration and Naturalization Service* (submitted by the Commissioner of the Immigration and Naturalization Service to the Attorney General) were published in mimeographed form.

**B 337-339. Declarations and petitions filed, and total naturalized, 1907-1945. SOURCES:** For 1907-1940, see Department of Labor, *Annual Report of the Secretary of Labor*, 1940, p. 115; for 1941, see Department of Justice, *Annual Report of the Attorney General*, 1941, p. 259; for 1942-1945, data are from Immigration and Naturalization Service records.

**B 337. Declaration of intention, 1907-1945. SOURCE:** See text for series B 337-339, above. Section 831 of the Nationality Act of 1940 provides that an applicant for naturalization after reaching the age of 18 years must make under oath, not less than 2 nor more than 7 years prior to the applicant's petition for naturalization, a signed declaration of his intention to become a citizen of the United States (54 Stat. 1153; 8 U. S. C. 731). This section contains substantially the requirements of the Basic Naturalization Act of 1906 concerning the declaration of intentions.

Prior to 1930 the number of declarations of intention was far in excess of the number of aliens naturalized. This was due mainly to the fact that many aliens failed to file a petition for naturalization within the prescribed time limit, as well as the denial of a number of petitions for naturalization. In most of the years since 1930 the number of aliens naturalized has been in excess of the declarations filed, because of the increasing number of persons who were exempted from the general requirements for a declaration of intention.

After the effective date of the 1906 Act, a number of laws were passed exempting special classes of persons from the general requirement of a declaration of intention. Most of these laws have been codified into the Nationality Act of 1940. Included among such exempted classes are noncitizen spouses of United States citizens; certain former citizens; noncitizens who, because of misinformation, erroneously exercised the rights of citizenship; noncitizens who, at the time of entering the United States, were less than 16 years of age; certain noncitizens who have served honorably in the United States armed forces (section 324, Nationality Act of 1940) or on certain vessels (section 325, Nationality Act of 1940); certain noncitizen children; and noncitizens who in World War II served honorably in the United States armed forces in the United States or outside of the United States (sections 701 and 702, Nationality Act of 1940).

**B 338. Petition for naturalization, 1907-1945.** SOURCE: See text of series B 337-339, above. Section 332 of the Nationality Act of 1940 (54 Stat. 1154; 8 U. S. C. 732), which is substantially a reenactment of a similar provision in the Act of June 29, 1906, provides that an applicant for naturalization must, not less than 2 nor more than 7 years after the declaration of intention has been made, file a sworn petition for naturalization in the format prescribed in the law.

While the naturalization laws exempt special classes of persons from the requirement of a declaration of intention, there are no similar exemptions from the requirement of a petition or formal application for naturalization.

In making comparisons of the number of petitions filed with the number of aliens naturalized, allowances should be made for the time elapsed between the date of filing of petition and the date of naturalization. Hence, it will be seen that in some of the years the number of petitions filed is less than the number naturalized. Another factor to be kept in mind in making comparisons is that of the total number of petitions filed in a given year, a certain number were denied by the courts. Statistics of petitions for naturalization denied have been compiled since the fiscal year 1907. The denial of a petition does not preclude the alien from filing another petition at a later date upon meeting the naturalization requirements.

**B 339. Aliens naturalized, 1907-1945.** SOURCE: See text for series B 337-339, above. The term *aliens naturalized* in naturalization statistics means aliens upon whom naturalization was conferred in the United States by a naturalization court or outside of the United States by a representative of the Immigration and Naturalization Service designated by the Commissioner or Deputy Commissioner. The total number of aliens naturalized includes both civilian and military naturalizations.

The statistics of aliens naturalized do not include figures on: repatriations under section 323 of the Nationality Act of 1940 of former citizens of the United States who lost citizenship by entering the armed forces of allied countries during World War I, and former citizens who lost citizenship of the United States by voting in a political election in a foreign state other than a state at war with the United States during the Second World War; repatriations under section 317 (b) of the Nationality Act of 1940 of women citizens at birth who lost or are believed to have lost citizenship through marriage to an alien and whose marriages have terminated; and repatriations under the Act of June 25, 1936, as amended, of native-born women who lost citizenship by marriage. Separate statistics on these repatriations are compiled by the Immigration and Naturalization Service.

Separate statistics are also compiled by the Immigration and Naturalization Service on certificates of derivative citizenship granted and denied, expatriations, certificates of naturalization revoked, and petitions for naturalization denied.

**B 340-341. Sex of aliens naturalized, 1923-1945.** SOURCES: For 1923-1932, see Department of Labor, Bureau of Naturalization, *Annual Reports of the Commissioner of Naturalization*,

1923-1932; for 1933-1940, see *Annual Report of the Secretary of Labor*, 1933-1940; for 1941, see Department of Justice, *Annual Report of the Attorney General*, 1941, p. 239; for 1942-1945, data are from Immigration and Naturalization Service records.

**B 342-349. Aliens naturalized by country of former allegiance, 1923-1945.** SOURCE: For 1923-1932, see *Annual Reports of the Commissioner of Naturalization*, cited above; for 1933-1945, data are from Immigration and Naturalization Service records.

The term *country of former allegiance* or *nationality* is construed to mean the country of which the alien at the time was a citizen or subject. Data on the number of aliens naturalized, by country or region of former allegiance, have been compiled only from July 1, 1922. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. The principal changes in reporting since 1923 are shown in the text for individual series below.

**B 342. Northwestern Europe, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes the British Empire, Norway, Sweden, Denmark, Netherlands, Belgium, Luxembourg, Switzerland, and France. In the fiscal years 1924-1932, the figures for the British Empire were classified by country: Ireland, England, Canada, Scotland, Wales, and Australia. Canada is shown separately in the fiscal years 1923-1932, and from 1933 on is included in the British Empire. Palestine and Syria and the Lebanon have been reported separately prior to the fiscal year 1945 and included in the figures for Asia. From 1945 Palestine is included in the figures for the British Empire, and Syria and the Lebanon in the figures for France.

**B 343. Central Europe, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes Germany, Poland, Czechoslovakia, Austria, Hungary, Yugoslavia, and Montenegro. In the fiscal years 1938-1945, Austria was included with Germany. In the years 1923-1932, Yugoslavia was recorded in naturalization statistics as the Kingdom of Serbs, Croats, and Slovenes.

**B 344. Eastern Europe, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes the Union of Soviet Socialist Republics, Latvia, Estonia, Lithuania, Finland, Rumania, Bulgaria, and Turkey. In the fiscal years 1923-1928 Latvia and Estonia were included with Russia. During 1923-1927 Lithuania comprised portions of Russia and Germany. European and Asiatic Turkey are included in Eastern Europe.

**B 345. Southern Europe, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes Greece, Italy, Spain, Portugal, and, from 1929 to 1946, "Other Europe," which comprises Albania, the Free City of Danzig, Liechtenstein, San Marino, Monaco, and Andorra. In the fiscal years 1923-1928 "Other Europe" was recorded under the "Miscellaneous" group of countries and is included with "All other" in series B 349.

**B 346. Asia, 1927-1945.** SOURCE: See text of series B 342-349, above. In the fiscal years 1923-1927, Asia was included under the "Miscellaneous" group of countries, which is shown here as "All other" (B 349). Separate figures for Syria and the Lebanon have been reported for 1928-1944; for Palestine for 1929-1944; for Iran (Persia), Iraq, and Afghanistan since 1929; for China and Japan since 1932; for Arabian Peninsula and India since 1943, and for Thailand (Siam) since 1944. Beginning 1945 Syria and the Lebanon and Palestine have been included in Northwestern Europe. Racial restrictions upon naturalization have, of course, limited the number of aliens naturalized who were citizens, or subjects, of countries located in Asia.

**B 347. Canada, 1923-1932.** SOURCE: See text of series B 342-349, above.

**B 348. Other America, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes Mexico, the West Indies, Central and South America. Figures for "Other America" countries were not compiled separately in the fiscal year 1923. Figures for Mexico

date from 1924; for the West Indies (Cuba, Dominican Republic, and Haiti separately) from 1929. In the fiscal years 1924-1928, the figures for Central and South America were combined. Separate figures have been compiled for independent countries in Central and South America beginning with the fiscal year 1929, except in the fiscal year 1933.

**B 349. All other, 1923-1945.** SOURCE: See text of series B 342-349, above. Includes "Miscellaneous" countries, 1923-1928; repatriated Americans, 1924-1934; Egypt, 1929-1944; Ethiopia, 1929-1945; Liberia, 1929-1945; Morocco, 1929-1945; Cameroons (French Mandate), 1945; Philippines, 1929-1945; Samoa, 1944-1945; Guam, 1944-1945; Panama Canal Zone, 1945; Puerto Rico, 1945; and "stateless nationality," 1945. From 1935 repatriated Americans have been included with countries of former allegiance. These repatriations include only former citizens of the United States to whom certificates of naturalization were issued by a clerk of court and should be distinguished from repatriations under Sections 317 (b) and 323 of the Nationality Act of 1940 and repatriations under the Act of June 25, 1936, as amended, statistics

of which are compiled separately and not included in the total number of aliens naturalized. Egypt is included in the British Empire in 1945.

**NONIMMIGRANT ALIENS ADMITTED AND ALIENS DEPARTED  
(B 350-352)**

**B 350. Nonimmigrant aliens admitted, 1906-1945.** SOURCES: For 1906-1907, see *Annual Reports of the Commissioner General of Immigration*, 1906-1907; for 1908-1931, see *Report* for 1931, p. 213; for 1932, see *Report* for 1932, p. 57; for 1933-1945, data are from Immigration and Naturalization Service records. For definitions of nonimmigrant aliens, see general note to series B 304-352.

**B 351-352. Aliens departed, 1906-1945.** SOURCE: For 1908-1931, see *Annual Report of the Commissioner General of Immigration*, 1931, pp. 213 and 239; for 1932, see *Report*, 1932, pp. 57 and 74; for 1933-1945, data are from Immigration and Naturalization Service records. For definitions of term, see general note to series B 304-352.

Series B 1-12.—POPULATION, DECENNIAL SUMMARY—AGGREGATE, UNITED STATES, TERRITORIES AND POSSESSIONS: 1790 TO 1940

SERIES B 24-25.—AREA—TERRITORIAL EXPANSION: 1790 TO 1946

ACCESSION	Date	Gross area (land and water) sq. mi.	ACCESSION	Date	Gross area (land and water) sq. mi.
Total, 1946 (excl. P.I.) <sup>1</sup>		3,619,644	Territories and possessions		597,257
Continental U. S.		3,022,387	Virgin Islands of the United States	1917	133
Gadsden Purchase	1853	29,640	Panama Canal Zone	1904	553
Mexican Cession	1848	529,017	American Samoa	1900	76
Oregon	1846	235,580	Guam	1899	206
Texas	1845	390,144	Puerto Rico	1899	3,435
By treaty with Spain:			Hawaii and misc. Pacific Islands <sup>2</sup>	1898	6,454
Florida	1819	58,560	Alaska	1867	586,400
Other areas	1819	13,443			
Louisiana Purchase	1803	827,192			
Territory in 1790 <sup>2</sup>		888,811			

<sup>1</sup> The Philippine Islands (area 115,000 square miles), ceded by Spain in 1898, constituted a territorial possession of United States from 1898 to 1946; granted independence as of July 4, 1946, when they became "Republic of the Philippines."  
<sup>2</sup> Includes that part of drainage basin of Red River of the North, south of the 49th parallel, sometimes considered part of Louisiana Purchase.

<sup>3</sup> Includes Howland, Baker, Jarvis, Midway, Kure or Ocean, Wake, and certain other small islands; also Canton and Enderbury Islands in Phoenix Group which are under joint use and control of United States and Great Britain.

SERIES B 26-30.—AREA AND POPULATION—CONTINENTAL UNITED STATES: 1790 TO 1940

YEAR	AREA (SQUARE MILES)			POPULATION	
	Gross area	Land	Water	Number	Per sq. mile of land area
1940 (Apr. 1)	3,022,387	2,977,128	45,259	131,669,275	44.2
1930 (Apr. 1)	3,022,387	2,977,128	45,259	122,775,046	41.2
1920 (Jan. 1)	3,026,789	2,973,776	53,013	105,710,620	35.5
1910 (Apr. 15)	3,026,789	2,973,890	52,899	91,972,266	30.9
1900 (June 1)	3,026,789	2,974,159	52,630	75,994,575	25.6
1890 (June 1)	3,026,789	2,973,965	52,824	62,947,714	21.2
1880 (June 1)	3,026,789	2,973,965	52,824	50,155,783	16.9
1870 (June 1)	3,026,789	2,973,965	52,824	39,813,449	13.4
1860 (June 1)	3,026,789	2,973,965	52,824	31,443,321	10.6
1850 (June 1)	2,997,119	2,944,337	52,782	23,191,876	7.9
1840 (June 1)	1,792,223	1,753,588	38,635	17,069,453	9.7
1830 (June 1)	1,792,223	1,753,588	38,635	12,866,020	7.3
1820 (Aug. 7)	1,792,223	1,753,588	38,635	9,638,453	5.5
1810 (Aug. 6)	1,720,122	1,685,865	34,257	7,239,881	4.3
1800 (Aug. 4)	892,135	867,980	24,155	5,308,483	6.1
1790 (Aug. 2)	892,135	867,980	24,155	3,929,214	4.5

<sup>1</sup> Change in area due to remeasurement for Census of 1940.  
<sup>2</sup> Revised to include adjustments for underenumeration in Southern States, see series B 2 and B 13.

Series B 31-39.—POPULATION, ANNUAL SUMMARY—SEX, AGE, AND COLOR, CONTINENTAL UNITED STATES: 1790 TO 1945

[Estimated population on July 1 of each year. Figures for 1917-1919 and 1940-1945, inclusive, include armed forces outside continental United States]

YEAR	Total population, continental United States	SEX		COLOR		AGE LAST BIRTHDAY			
		Male	Female	White	Nonwhite	Under 15 years	15-44 years	45-64 years	65 years and over
		31	32	33	34	35	36	37	38
1945	139,585,518	69,648,409	69,937,109	125,027,968	14,557,550	35,131,818	65,800,764	23,538,838	10,114,098

<sup>1</sup> Comprises Filipino, Hindu, Korean, Polynesian, and other Asian.  
<sup>2</sup> Exclusive of Indians in Indian Territory and in Indian reservations not enumerated at censuses prior to 1890.  
<sup>3</sup> Unrevised, see series B 2, footnote 11.

Series B 48-71.—POPULATION—RACE BY REGIONS: 1790 TO 1940

[Figures for white population in 1930 have been revised to include Mexicans who were classified as nonwhite in 1930 reports. Figures for 1830 and 1840 exclude the small number of persons on board ships, not credited to any State or territory]

Series B 72-80.—POPULATION—MEDIAN AGE, BY COLOR AND SEX: 1790 TO 1940

[Because of change in computation procedure, medians for 1850 to 1930 differ slightly from those published in the Population census reports for 1930 and previous years]

1880	9,945,916	-----	5.04	-----	-----	-----	-----	-----	-----	-----	-----
1870	7,579,363	-----	5.09	-----	-----	-----	-----	-----	-----	-----	-----
1860	5,210,934	-----	5.28	-----	-----	-----	-----	-----	-----	-----	-----
1850	3,598,240	-----	5.55	-----	-----	-----	-----	-----	-----	-----	-----
1790	557,889	5.43	5.79	-----	-----	-----	-----	-----	-----	-----	-----

<sup>1</sup> Statistics for 1790, 1900, 1930 and 1940 represent private families only; those for 1850 to 1890, 1910, and 1920 include the small number of institutions and other quasi households which were counted as families in those years.

<sup>2</sup> Statistics for 1930, and 1940 include the family head and his relatives only; those for 1890 and 1900 include all persons, whether related to the head or not, in both private and quasi households; those for 1790 relate to private families only but include lodgers and other nonrelatives in addition to the head and his relatives.

<sup>3</sup> Obtained by dividing total population (total free population in 1790, 1850, and 1860) by number of families; hence not strictly average size of private families because total population includes an appreciable number of persons who are members of quasi households.

<sup>4</sup> Nonfarm families in 1930 and 1940 include the small number of urban-farm families.

<sup>5</sup> Based on white and Negro families for which marital status of head was reported.

<sup>6</sup> Free population only.

Series B 182-194.—INTERNAL MIGRATION—INTERSTATE MOVEMENT OF NATIVE POPULATION AND NUMBER OF THE FOREIGN BORN: 1850 TO 1940

YEAR	Total population	NATIVE									FOREIGN BORN			
		Total		With State of birth reported						State of birth not reported	Born in outlying possessions	American citizens born abroad or at sea	Number	Percent of total population

<sup>1</sup> The North: New England, Middle Atlantic, East North Central, and West North Central divisions. The South: South Atlantic, East South Central, and West South Central divisions.

<sup>2</sup> Excess of persons born in the South and living in the North over persons born in the North and living in the South.

Series B 215-230.—INTERREGIONAL MOVEMENT—NATIVE WHITE AND NONWHITE POPULATION: 1890 TO 1940

[Excludes the small number of native persons born outside continental United States and persons for whom State of birth was not reported. Figures for white population in 1930 have been revised to include Mexicans who were classified as nonwhite in the 1930 reports. For census divisions and States comprising each region, see data and text of series B 48-71]

Series B 279-303.—COUNTRY OF BIRTH OF THE FOREIGN-BORN POPULATION (CENSUS): 1850 TO 1940

[Figures for 1910 to 1940 are for foreign-born white; those for earlier years represent total foreign born. Figures are given for each country for all census years for which data are available. Figures for 1930 have been revised to include Mexicans who were classified with "Other races" in the 1930 Population Census]

<sup>1</sup> Turkey in Asia included with Turkey in Europe prior to 1910.

<sup>2</sup> Persons reported in 1910 as of Polish mother tongue born in Austria, Germany, and Russia have been deducted from their respective countries and combined as Poland.

<sup>3</sup> Includes "Other Atlantic Islands."

<sup>4</sup> Includes "country of birth not reported" and "born at sea."

<sup>5</sup> Includes 4,635 persons born in Serbia and 5,363 persons born in Montenegro, which became part of Yugoslavia in 1918.

<sup>6</sup> Turkey in Asia included Armenia, Palestine, and Syria in 1910. Subsequent to 1910 Armenia included with "Other Asia."

Series B 304-330.—IMMIGRATION—IMMIGRANTS BY COUNTRY: 1820 TO 1945

For continuation of list of countries, see series B 317-330. Data are for fiscal years ending June 30, except: 1820-1831 and 1844-1849, fiscal years ending Sept. 30; and 1833-1842 and 1851-1867, years ending Dec. 31; 1832 covers 15 months ending Dec. 31; 1843, nine months ending Sept. 30; 1850, fifteen months ending Dec. 31; 1868, six months ending June 30]

<sup>1</sup> Differences between series B 304 and B 331 for the years 1820 to 1868 may be due to the fact that the source of statistics was different.

<sup>2</sup> Comprises Netherlands, Belgium, Luxembourg, Switzerland, and France.

<sup>3</sup> Includes Austria, 1938 to 1945.

<sup>4</sup> Poland was recorded as a separate country from 1820 to 1898 and from 1920 to 1945. Between 1899 and 1919 Poland was included with Austria-Hungary, Germany, and Russia.

<sup>5</sup> Comprises Austria-Hungary for 1861-1904; Austria, 1905-1937; Hungary, 1906-1945; Czechoslovakia and Yugoslavia, 1920-1945.

<sup>6</sup> Countries added to the list since the beginning of World War I are theretofore included with the countries to which they belonged. In the fiscal year 1931 the Russian Empire was broken down into European Russia and Siberia (Asiatic Russia).

<sup>7</sup> Comprises Rumania, Bulgaria, and Turkey in Europe.

<sup>8</sup> Comprises Spain, Portugal, Greece, and other Europe, not elsewhere classified.

## Series B 304-330.—IMMIGRATION—IMMIGRANTS BY COUNTRY: 1820 TO 1945—Con.

(For continuation of list of countries, see series B 317-330. Data are for fiscal years ending June 30, except: 1820-1831 and 1844-1849, fiscal years ending Sept. 30; and 1833-1842 and 1851-1867, years ending Dec. 31; 1832 covers 15 months ending Dec. 31; 1843, nine months ending Sept. 30; 1850, fifteen months ending Dec. 31; 1868, six months ending June 30)

<sup>1</sup> No record of immigration from Turkey in Asia until 1869.  
<sup>2</sup> No record of immigration from Japan until 1861.

<sup>3</sup> Prior to 1920 Canada and Newfoundland were recorded as British North America. From 1820 to 1898 the figures include all British North American possessions.

<sup>4</sup> From 1934 to 1945, inclusive, Philippine Islands are included in "All other countries."

<sup>5</sup> Includes 32,897 persons returning to their homes in the United States.

<sup>6</sup> Included in "All other countries."

<sup>7</sup> No record of immigration from Mexico from 1886 to 1893.

## Series B 304-330.—IMMIGRATION—IMMIGRANTS BY COUNTRY: 1820 TO 1945—Con.

[For grand total and Europe, see series B 304-316. Data are for fiscal years ending June 30, except: 1820-1831 and 1844-1849, fiscal years ending Sept. 30; and 1833-1842 and 1851-1867, years ending Dec. 31; 1832 covers 15 months ending Dec. 31; 1843, nine months ending Sept. 30; 1850, fifteen months ending Dec. 31; 1868, six months ending June 30]

<sup>1</sup> Differences between totals in series B 304 and series B 331 for the years 1820 to 1863 may be due to the fact that the source of statistics was different. See text.  
<sup>2</sup> For years 1940-1944, figures in series B 334 include, and those in series B 335 exclude, immigrants 45 years old.  
<sup>3</sup> Not reported.

<sup>4</sup> 6 months ending June 30.  
<sup>5</sup> 3 months ending December 31.  
<sup>6</sup> 9 months ending September 30.

Series B 337-349.—NATURALIZATION OF ALIENS—SEX AND FORMER ALLEGIANCE:

## Chapter C. Vital Statistics, Health, and Nutrition (Series C 1-155)

### Vital Statistics: Series C 1-78

**C 1-78. General note.** Vital statistics, including statistics of births, deaths, and marriages and divorces, are compiled on a national basis by the National Office of Vital Statistics, United States Public Health Service. Prior to the transfer of the vital statistics functions of the Federal government, on July 16, 1946, from the Department of Commerce to the Federal Security Agency, this activity was carried on in the Bureau of the Census. All tabulations of births, deaths, and stillbirths made by the United States Public Health Service utilize data from transcripts or microfilm copies of the original birth, death, and stillbirth certificates that are received from registration officials of States and cities, and of the outlying territories and possessions of the United States. At present, tabulations of marriages and divorces are limited to numbers occurring, obtained annually from State registration officials; and to numbers of marriage licenses issued, obtained monthly from State and county officials.

*Completeness of registration.*—Although every State has adopted a vital statistics law requiring the registration of all births and deaths, these laws are not uniformly enforced. In most States where the registration organization is well established and where the persons responsible for filing certificates appreciate the value of registration to the individual as well as its value for statistical purposes, practically all births and deaths are registered. In other States, however, the underregistration is enough to affect the use of tabulated data for certain purposes.

Detailed information on the completeness of death registration in each State is not available. One condition required for admission to the national registration areas was that there exist a demonstrated completeness of registration of at least 90 percent. Using this as a criterion, all of the States were admitted to the registration areas by 1933, and although registration has become more complete in most States, it is possible that there has been regression in others. It is believed that death registration is more complete than birth registration.

The first Nation-wide test of completeness of birth registration was made by the Bureau of the Census in connection with the decennial Census in 1940. In that test, it was found that the registration of births in the United States was 92.5 percent complete. (See *Vital Statistics—Special Reports*, vol. 17, No. 18, p. 227, Bureau of the Census, Washington, D. C., 1943.)

With respect to registration completeness for stillbirths, and for marriages and divorces, see text for series C 38 and C 77-78, respectively.

*Comparability of prewar and wartime rates.*—For the war period, 1940-1945, crude birth and death rates (series C 24 and C 45) as conventionally computed are not entirely comparable with those for prewar years as measures of general fertility and mortality. The transfer overseas of several million men caused changes in the age and sex composition of the population in the continental United States. The selection of men for military service overseas also changed the characteristics of the continental population with respect to physical fitness. These factors affect the interpretation of conventional crude birth and death rates.

*Population bases for rates.*—In order to present crude birth and death rates that will be most useful for comparative purposes, different population bases were selected for the various rates. The crude birth rate (series C 24) for the United States for 1940-1945 is based upon the total estimated population including the armed forces overseas; the crude death rate (series C 45) is based on the

estimated population excluding the armed forces overseas. Crude marriage rates for 1917-1919 and 1940-1945 are based on total estimated population excluding armed forces overseas, and crude divorce rates for the same years on estimated population including armed forces overseas.

**C 1-5. Growth of the birth- and death-registration areas, 1900-1945.** SOURCE: For 1900-1944, see Bureau of the Census, *Vital Statistics of the United States, 1944*, part I, table B, p. VI; for 1945, see United States Public Health Service, National Office of Vital Statistics, "United States Summary of Vital Statistics, 1945," *Vital Statistics—Special Reports*, vol. 26, No. 1, table B, p. 8. See also general note for series C 1-78, above.

The first birth and death statistics published by the Federal Government were collected during the decennial Census of 1850 and covered the entire United States. Similar collections were made at each census up to and including the Census of 1900, but because of the time interval between the occurrence of a birth or a death and the census enumeration, the reports were inaccurate and incomplete.

*Death-registration areas.*—In 1880, the Bureau of the Census established a national "registration area" for deaths, consisting of only two States—Massachusetts and New Jersey. In addition, the District of Columbia and several large cities had efficient systems for the registration of births and deaths. By 1900 eight other States had been admitted to the registration area. For the years 1880, 1890, and 1900, mortality data were received from the States and cities included in this expanding area; but birth and death figures for the entire country were still compiled from the reports of census enumerators. Reliable annual series of mortality statistics are available for Massachusetts over a longer period, and several of them have been included in this volume. (See series C 53-55 and C 62-64.)

The annual collection of mortality statistics for the death-registration area began with the calendar year 1900. In 1902, the Bureau of the Census was authorized to obtain, annually, copies of records filed in the vital statistics offices of those States and cities having adequate death-registration systems. At that time not all States had enacted laws requiring the registration of deaths, and in many States the existing laws were poorly enforced.

The death-registration area for 1900 consisted of 10 States, the District of Columbia, and a number of cities located in nonregistration States, included 40.5 percent of the population of the continental United States, was predominantly urban, and was characterized by a high proportion of white persons. If reporting cities located in nonregistration States are excluded, the population of the death-registration States comprised only 26.2 percent of the total population of the United States.

*Birth-registration areas.*—As it is more difficult to obtain accurate and complete registration of births than of deaths, the national birth-registration area was not established until 1915. The original birth-registration area of 1915 consisted of 10 States and the District of Columbia. Since 1933, the birth- and death-registration areas have included all 48 States.

*Geographic coverage.*—Prior to 1940, most of the national mortality tabulations were based on data collected from the registration areas. Beginning with 1940 all published material for the United States relating to the period prior to the completion of the death-registration area in 1933 includes only findings for the registration States and excludes the cities in nonregistration States. This change decreases the mortality statistics coverage of

the United States, but it has its advantages in that more reliable population estimates are available for the registration States than for the registration areas. No change in coverage has been made for natality statistics since the birth-registration areas at no time included cities in nonregistration States.

Because of the growth of the areas for which data have been collected and tabulated, it is impossible to obtain a national series of geographically comparable data prior to 1933. However, rates for the expanding groups of registration States are approximations to complete national rates, and general comparisons over a long period of years may be made. More exact trends for parts of the United States can be secured through the use of some constant area, such as the original registration States, or the registration States of 1920.

**C 6-21. Complete expectation of life, 1789-1945.** SOURCES: See below. The complete expectation of life at a specified age is the average number of years lived by members of a hypothetical cohort of individuals, assumed to be subject throughout the remainder of their lives to the age-specific mortality rates observed in a given time period.

**C 6-13. Expectation of life of the white population in the United States, 1900-1902 to 1945.** SOURCES: For 1900-1902 to 1929-1931, see United States Bureau of the Census, *United States Life Tables, 1900-1931*, pp. 4-7, 20-23, 28-31, and 40-51; for 1930-1939, see United States Bureau of the Census, *United States Life Tables, 1930-1939 (Preliminary), for White and Nonwhite by Sex*, pp. 4-7, tables 1 and 2; for 1939-1941, see Bureau of the Census, *United States Life Tables and Actuarial Tables, 1939-1941*, pp. 34-37, tables 5 and 6; for 1945, see National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 23, No. 11, p. 248, table 1. See also text for series C 6-21, above.

**C 14-21. Expectation of life in Massachusetts, 1789 to 1929-31.** SOURCE: For 1789 see Sydenstricker, Edgar, in *Recent Social Trends in the United States*, Report of the President's Research Committee on Social Trends, McGraw-Hill, New York, 1933, p. 605, table 1; for 1850, see Metropolitan Life Insurance Co., *Statistical Bulletin*, vol. 9, No. 3, March 1928, pp. 7-8; for 1855, see Sydenstricker, cited above; for 1878-1882, see Metropolitan Life Insurance Co., cited above; for 1890, see United States Bureau of the Census, *United States Life Tables, 1890, 1901, 1910, and 1901-1910*, tables 41-46, pp. 132-143; for 1893-1897, see Metropolitan Life Insurance Co., cited above; for 1900-1902 and 1909-1911 see Bureau of the Census, cited above; for 1919-1920, see Sydenstricker, cited above, and United States Bureau of the Census, *United States Abridged Life Tables, 1919-1920*, tables 9 and 10, pp. 24-27; for 1929-1931, see National Resources Committee, *Population Statistics 2, State Data*, p. 38. See also text for series C 6-21, above.

**C 22-23. Number of children under 5 years old per 1,000 women 20 to 44 years old, 1800-1940.** SOURCE: Department of Commerce, Bureau of the Census, *Forecasts of the Population of the United States, 1945-1975*, by P. K. Whelpton, Washington, D. C., 1947, table 14, p. 16. All ratios have been adjusted for underenumeration of children, and all except those for whites in 1800-1820 have been standardized to the age distribution of United States women in 1930. Ratios for census years 1800-1840 are estimated from data on children under 10 years old.

**C 24-26. Birth rates by race, 1915-1945.** SOURCES: For 1915-1939, see Bureau of the Census records, and *Vital Statistics Rates in the United States, 1900-1940*, table 45, p. 668; for 1940-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics," 1944 and 1945, *Vital Statistics—Special Reports*, vol. 24, No. 1, p. 9, and vol. 26, No. 1, table D, p. 9. See also general note for series C 1-78 and text for series C 1-5.

**C 27-36. Birth rates by age of mother, 1918-1945.** SOURCES: For 1918-1939, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 46, p. 669; for 1940-1945,

see National Office of Vital Statistics, "United States Summary of Vital Statistics, 1945," *Vital Statistics—Special Reports*, vol. 26, No. 1, table G, p. 11. These are age-specific rates which express the number of births to women in a specified age group per 1,000 female population of that age group.

**C 37. Gross reproduction rates, 1918-1945.** SOURCE: For 1918-1944, see National Office of Vital Statistics, "Births by Age of Mother, Race, and Birth Order, United States and Each State, 1944," *Vital Statistics—Special Reports*, vol. 25, No. 9, table A, p. 143; for 1945 the figures represent an unpublished special computation.

The gross reproduction rate represents the number of daughters a hypothetical cohort of 1,000 women entering the childbearing period would have during their lives, if they were subject to the given set of age-specific birth rates, and if none of the cohort were to die before childbearing period was completed. The rate may be defined as the sum of the age-specific birth rates of female infants per 1,000 women of each single year of age. In computing the gross reproduction rates in this table, the age-specific rates for the five-year age groups have been multiplied by five, summed, and the total for all age groups multiplied by the proportion which female births formed of all births. The rates have not been corrected for incomplete registration of births.

Assuming no migration, if the gross reproduction rate remained below 1,000, for example, no improvement in mortality alone could prevent the population from declining when a stable age distribution had been reached. In short, the gross reproduction rate represents the maximum possible replacement which might be expected from the given set of age-specific birth rates. However, only in this sense of maximum possible replacement is the gross reproduction rate a measure of population replacement.

**C 38. Stillbirth ratios, 1922-1945.** SOURCE: For 1922-1940, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1943*, table 41, pp. 654-655; for 1941-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics," *Vital Statistics—Special Reports*, 1944, vol. 24, No. 1, and 1945, vol. 26, No. 1, table A, p. 7. See also general note for series C 1-78, above.

No exact information is available concerning completeness of stillbirth registration, but it is believed to be less complete than registration of live births. The comparability of the trend of stillbirth ratios is also affected by the differing definitions of stillbirth followed by the various States. The ratios published here are based on an expanding registration area (see series C 1-5) to which States with differing definitions, and even changing definitions, were periodically being added.

**C 39-44. Infant and maternal mortality rates, 1915-1945.** SOURCES: See detailed listing below.

**C 39-41. Infant mortality rates, by color, 1915-1945.** SOURCES: For 1915-1940, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 26, pp. 572-575; for 1941-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics," *Vital Statistics—Special Reports*, 1944, vol. 24, No. 1, and 1945, vol. 26, No. 1, table D, p. 9.

The figures published here are infant mortality rates not corrected for changing number of births. These crude rates will not exactly reflect changes in infant mortality during periods in which the annual number of births is changing rapidly. This rate relates all infant deaths occurring during a given year to the number of live births which occurred during that year. However, the group of infants dying during a specified year is comprised of infants born in the same or in the previous year. A more accurate measure of infant mortality can be obtained by relating infant deaths during a specified year to the year in which those infants were born. See Bureau of the Census, "Effect of Changing Birth Rates Upon Infant Mortality Rates," *Vital Statistics—Special Reports*, vol. 19, No. 21.

**C 42-44. Maternal mortality rates, by race, 1915-1945.** SOURCE: For 1915-1940, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 37, p. 622; for 1941-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics," *Vital Statistics—Special Reports, 1944*, vol. 24, No. 1, and 1945, vol. 26, No. 1, table D, p. 9.

**C 45-55. Death rates by race and sex, 1865-1945.** SOURCE: See detailed listings below. See also general note for series C 1-78 and text for series C 1-5.

**C 45-51. Death rates by race and sex, death-registration States, 1900-1945.** SOURCES: For 1900-1939, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 3, p. 127; for 1940-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics, 1945," *Vital Statistics—Special Reports*, vol. 26, No. 1, table R, p. 14.

**C 52. Age-adjusted death rates, 1900-1945.** SOURCE: For 1900-1940, see Bureau of the Census, "Age-Adjusted Death Rates in the United States, 1900-1940," *Vital Statistics—Special Reports*, vol. 23, No. 1, table 3, p. 17; for 1941-1945, see Federal Security Agency, United States Public Health Service; annual report, *Vital Statistics of the United States, 1945*, table AJ, p. XXIX, part 1.

The age-adjusted death rate is a convenient summary index that "corrects" for differences in age composition. These rates were computed by taking the age distribution of the 1940 population as the "standard" without regard to sex, color, or other characteristics. The age-specific death rates actually observed in a given year were applied to the age distribution of this standard population and a total death rate was computed. Age-adjusted rates are abstract figures and have no particular significance except in relation to other rates adjusted to the same standard population. Such age-adjusted rates should not be compared directly with crude death rates. For more detail, see source cited above for 1900-1940.

**C 53-55. Death rates by sex, Massachusetts, 1865-1945.** SOURCE: For 1865-1899, see *77th Annual Report of Vital Statistics of Massachusetts*, p. 125; for 1900-1940, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 3, pp. 135-136; for 1940-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics, 1945," *Vital Statistics—Special Reports*, vol. 26, No. 1, table Y, p. 31.

**C 56-64. Death rates, selected causes, 1861-1945.** SOURCES: See detailed listings below. The mortality data published by the United States Public Health Service are tabulated according to the numbers and titles of the detailed International List of Causes of Death. The International List is revised decennially in order that the terminology by which deaths are classified may be consistent with advances in medical science and changes in diagnostic practice.

A large proportion of the death certificates filed annually in the United States report two or more diseases or conditions as causes of death. These multiple conditions or diseases are known as joint causes of death. General statistical practice requires that cases involving more than one cause of death be charged to a single cause rather than to a combination of causes, and it is necessary to employ a selection process to determine the one cause to be assigned. The method of selection used has an important effect upon the resulting statistics.

In the French edition of the International List (1900) which was adopted by the United States Government in 1920, certain principles for determining the single cause to be selected from the joint causes given were incorporated as a part of the general classification scheme. As an outgrowth of practices in this country following 1902, definite relationships among the various conditions represented by items in the International List were put into concrete form in the *Manual of Joint Causes of Death*, first published in 1914, and revised in 1925 and 1933 to conform with successive revisions of the International List. The *Manual of Joint Causes of*

*Death* used in conjunction with the fifth revision of the International List is practically identical with that of 1933, with the exception of alterations required by changes in the International List itself. Changes in the *Manual of Joint Causes of Death* have been kept to a minimum, since changes in these relationships tend to disrupt statistical continuity.

Apart from the question of comparability between areas, there is the additional problem of comparability for a given area between years. To a certain extent, time-trend studies of causes of death would be facilitated if the International List were maintained without change over a long period of years. However, if the list were rigidly fixed it would soon be inconsistent with current medical knowledge and terminology. To obtain the advantages of frequent revision, and yet to retain a fixed list for a number of years, revisions of the list are made at an international conference every 10 years. In the process of revision, some causes of death included under one title may be transferred to other titles. Definite discontinuities are introduced into the time trends of death rates for certain specific causes of death, as indicated by a recent study (Dunn, Halbert L., and Shackley, William, "Comparison of Cause-of-Death Assignments by the 1929 and 1938 revisions of the International List: Deaths in the United States, 1940," Bureau of the Census, *Vital Statistics—Special Reports*, vol. 19, No. 14, pp. 153-278, 1944) on the comparability of titles in the 1929 and 1938 revisions of the International List.

Improvement in diagnostic procedures and development of medical knowledge and facilities are other important factors not to be overlooked in the study of changes in death rates for certain causes. For example, additional diagnostic cancer clinics located throughout the country may correctly diagnose many cancer deaths that might otherwise be classified in another disease classification or in the unknown or ill-defined cause group.

**C 56-61. Death rates for selected causes, United States, 1900-1945.** SOURCES: For 1900-1940, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 14, pp. 248-257; for 1941-1945, see National Office of Vital Statistics, "United States Summary of Vital Statistics, 1945," *Vital Statistics—Special Reports*, vol. 26, No. 1, table N, pp. 16-17.

**C 62-64. Death rates for selected causes, Massachusetts, 1861-1945.** SOURCES: For 1861-1899, see *77th Annual Report of Vital Statistics of Massachusetts*; for 1900-1945, refer to Bureau of the Census and United States Public Health Service. Basic figures are published in annual report, *Vital Statistics of the United States*.

**C 65-76. Death rates by age, 1900-1945.** SOURCE: For 1900-1939, see Bureau of the Census, *Vital Statistics Rates in the United States, 1900-1940*, table 6, p. 169; for 1940-1945, refer to Bureau of the Census and United States Public Health Service. Basic figures are published in annual report, *Vital Statistics of the United States*.

**C 77-78. Estimated marriage and divorce rates, 1867-1945.** SOURCE: National Office of Vital Statistics, "Marriage and Divorce Statistics: United States, 1946," *Vital Statistics—Special Reports*, vol. 27, No. 10. Estimates for earlier years were based on data in the following reports: Commissioner of Labor, *A Report on Marriage and Divorce in the United States, 1867 to 1886*; Bureau of the Census, *Marriage and Divorce, 1867-1906, Marriage and Divorce, 1916*, and *Marriage and Divorce*, annual reports, 1922-1932; Stouffer, S. A., and L. M. Spencer, "Recent Increases in Marriage and Divorce," *American Journal of Sociology*, vol. 44, No. 4 (for 1933-1936); Bureau of the Census, "A Review of Marriage and Divorce Statistics: United States, 1887-1937," "Estimated Number of Marriages by State: United States, 1937-1940," "Estimated Number of Divorces by State: United States, 1937-1940," *Vital Statistics—Special Reports*, vol. 9, No. 60, vol. 15, Nos. 13 and 18; National Office of Vital Statistics, "Marriage and Divorce in the United States, 1937-1945," *Vital Statistics—Special Reports*, vol. 23, No. 9. Other reports are: National Office of Vital Statistics, *Monthly Marriage Report* (marriage licenses

issued in major cities) 1939 to date; and *Quarterly Marriage Report* (marriage license figures monthly, by State) 1944 to date.

The population figures used as bases for computing marriage and divorce rates are identical for 1907 to 1916 and 1920 to 1939; they differ for remaining years, as follows: For 1887 to 1906, the population base figures exclude population of counties for which marriage reports and divorce reports, respectively, were not received. For the war years, 1917 to 1919 and 1940 to 1945, population base figures for marriage represent population present (excludes armed forces overseas); those for divorce represent total population (includes armed forces overseas). For exact population base figures, see *Vital Statistics—Special Reports*, vol. 23, No. 9.

Marriage and divorce records are filed only at the county level in many States, but gradually the various States are embodying in their vital statistics laws a requirement that such records be handled at the State level. Some form of centralization is now provided for marriage records in about two-thirds of the States, and for divorce records in about one-half of the States. The completeness of reporting to the State offices varies, and no tests have yet been made on this subject. At the time of the decennial Census of 1940, planning was begun for national registration areas for marriages and for divorces, but was discontinued. At present, no such areas have yet been established. (See National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 27, No. 10, p. 172, for a brief discussion of the 1940 project.)

### Health: Series C 79-119

**C 79-84. Physicians and dentists and medical and dental schools, 1810-1945.** SOURCES: See detailed listings below.

**C 79. Number of physicians, 1850-1942.** SOURCE: For 1850-1860, see reports of Population Census for these years; for 1870-1934, see Leland, R. G., *Distribution of Physicians in the United States* (revised), American Medical Association, 1936, and Bureau of the Census, Fifteenth Census of the United States, 1930, *Population*, vol. V, "General Report on Occupations"; for 1936-1942, see biennial *Directory of the American Medical Association*.

The total number of physicians in continental United States is available for approximately every second year from 1886 to 1942—from *Polk's Medical Register and Directory of the United States and Canada* until 1906 and from the *American Medical Directory* beginning in 1909. Leland estimates that there were 60,000 physicians in 1870 and 82,000 in 1880.

Data on the number of physicians are also available from the Census of Population for census years. Comparison of the census data with those of *Polk's Directory* and the *American Medical Directory* is shown in the following tabulation:

YEAR	CENSUS	POLK OR A.M.A.
1940	165,629	175,382
1910*	151,132	135,000
1900	132,002	119,749
1890	104,805	100,180

\* Census figure includes osteopaths; A.M.A. figure is an estimate made by Leland.

The difference of approximately 10,000 between the 1940 census figure and that of the American Medical Association is caused largely by the inclusion in the latter, as in all figures back through 1870 shown in series C 79, of physicians who are retired or not in practice for other reasons. The 1940 census figures refer to the labor force, i. e., to persons employed or seeking work; earlier census figures are largely for the gainfully occupied.

**C 80-81. Number of medical schools and graduates, 1880-1945.** SOURCES: For 1880-1893, see "Report on Medical Education and Medical Colleges" in *Fifteenth Annual Report of the State Board of Health of Illinois*, Springfield, Ill., 1894, and Leland, R. G., *Distribution of Physicians in the United States* (revised), American Medical Association, 1936; for 1900-1935, see Leland; for 1936-1945, see *Journal of the American Medical Association*, vol. 131, No. 16, August 17, 1946.

Data on the number of medical schools and graduates in the United States prior to 1900 are fragmentary and of dubious accuracy. Where two sets of figures are available, they are not in agreement.

The sharp reduction in number of schools since 1906 is largely the outcome of the inspection and classification system begun in 1904 by the American Medical Association.

Elimination of low-grade schools is reflected in the drop in graduates between 1904 and 1922. The 77 approved schools in operation today (1945) consist of 69 four-year schools, and 8 two-year schools limited to teaching the basic sciences. Very few unapproved schools remain in existence. The sharp rise in 1944 graduates reflects the curriculum acceleration instituted during World War II.

**C 82. Number of dentists, 1810-1940, decennially.** SOURCES: For 1810-1880, see O'Rourke, John T., and Miner, Leroy M. S., *Dental Education in the United States*, W. B. Saunders Co., 1941; for 1890-1900, see Bureau of the Census, Twelfth Census of the United States, 1900, *Population*, vol. II, part 2; for 1910-1930, see Fifteenth Census, 1930, *Population*, vol. V; for 1940, see Sixteenth Census, 1940, *Population, Comparative Occupation Statistics for the United States, 1870-1940*.

**C 83. Number of dental schools, 1840-1945.** SOURCES: For 1840-1934, see Noyes, Frederick B., "Dental Education, 1911-1936," *Oral Hygiene*, vol. 26, No. 1, Jan. 1936; for 1935-1945, see *Dental Students' Register*, 1944, 1945, Council on Dental Education, American Dental Association.

Sources employed by Noyes for the number of schools were as follows:

1840, 1841: Gies, W. J., *Dental Education in the United States and Canada*, bulletin 19, Carnegie Foundation for Advancement of Teaching, 1926, p. 42.

1842-1925: *Polk's Dental Register and Directory of the United States and Canada*, 1925, p. 35.

1926-1930: Gies, W. J., *Additional Remarks on a Reference to the Carnegie Foundation's Study of Dental Education*, *Journal of Dental Research*, vol. 10, Feb. 1930, p. 32.

1931: Greenleaf, W. J., *Dentistry*, Career Series, Leaflet No. 7, Office of Education, pp. 7-10.

The data supplied by Gies and Greenleaf refer to the number of schools offering courses in dentistry, while Polk's gives the number of schools conferring degrees in each year.

The first dental school in the United States was organized in 1840. Prior to that time all physicians practiced some dentistry, a few limiting their practice to this specialty. The dental practitioners who were not physicians learned their trade as apprentices or were self-taught. From 1840 to 1880 apprentice training was the chief source of supply, but by the end of this period most States had enacted laws requiring graduation from a dental school.

**C 84. Number of dental graduates, 1841-1945.** SOURCES: For 1841-1931, same as series C 83; for 1932-1940, see O'Rourke, John T., and Miner, Leroy M. S., *Dental Education in the United States*, W. B. Saunders Company, 1941; for 1941-1945, same as series C 83.

Noyes' sources for the number of graduates were:

1841-1908: Calculated from Koch, C. R. E., *History of Dental Surgery*, pp. 402, 403.

1909: *Polk's Dental Register and Directory of the United States and Canada*, 1925, p. 34.

1910-1930: Gies, W. J., *Is the Influx of New Graduates Commensurate With the Demand for Dental Service, or Should the Educational Requirements be Altered?* *Journal of the American Medical Association*, vol. 18, April 1931, p. 593.

The number of graduates annually, 1841 to 1924, is also reported in *Polk's Dental Register*, but the number of graduates for the early years given there far exceeds the number shown in histories of dentistry. Series C 84 presents the more conservative data.

The fluctuation in the number of graduates is "correlated (1) with changes in the number of dental schools and in requirements for admission, (2) with increase in State dental boards, and (3) to

some extent with the economic conditions of the country." (O'Rourke and Miner, *Dental Education in the United States*, p. 310.)

**C 85-91. Selected reportable diseases, 1912-1945.** SOURCE: Various issues of *Public Health Reports*, United States Public Health Service. Reporting communicable diseases is the concern of the several States, with reporting to the Federal government a cooperative affair into which all the States have entered voluntarily. Each State makes its own laws and regulations prescribing the diseases to be reported, the agencies and persons required to report, and penalties for failure to report. Morbidity reports vary in completeness of reporting and no disease is completely reported.

When the United States Public Health Service first requested morbidity data from the State health authorities in 1912, only 19 States and the District of Columbia responded. The diseases reported were diphtheria, measles, poliomyelitis, scarlet fever, tuberculosis, typhoid fever, and smallpox. While the number of diseases reported has increased, there are only 12 diseases reported by all the States. Some of the rates are based on a smaller number of States than shown in series C 85, because of an occasional failure by a State to report on some disease.

The form in which the reports are published by the United States Public Health Service has been changed several times. To present the data as shown here, rates were computed which do not appear in the published reports. Since the data for 1912-1920 were originally shown only for the individual States, a rate for the country was obtained for each disease by combining the information for those States reporting the particular disease. From 1921 through 1923 many of the rates included cases occurring in the Territories; these rates were recomputed to include only continental United States.

**C 92-103. Hospital facilities by type of service, 1909-1945.** SOURCES: Annual reports for 1920-1945, *Hospital Service in the United States*, Council on Medical Education and Hospitals, American Medical Association, Chicago, Illinois.

Statistical information on hospitals in the United States is customarily obtained from the annual census of hospitals, the results of which are published in *Hospital Service in the United States*, cited above. Although this annual census was begun in 1920, complete data on the number of hospital beds classified by type of service and by ownership or control are available only from 1927. Data prior to 1920 are fragmentary. The *American Medical Directory* for the years 1909, 1914, and 1918 gives total number of hospitals and beds for those years.

The American Medical Association includes in its census only the hospitals registered by it. The United States Bureau of the Census reports that there were in 1939 a total of 3,513 unregistered institutions with a capacity of 89,614 beds (*Vital Statistics—Special Reports*, vol. 13, No. 2, "Hospital and Other Institutional Facilities and Services, 1939").

*General hospitals* accept patients for a variety of acute medical and surgical conditions. The majority of them do not admit cases of contagious disease, tuberculosis, and nervous and mental disease. *Hospitals for the mentally ill* include institutions for the mentally deficient and the epileptic. *Tuberculosis hospitals* include sanatoria and preventoria, the latter emphasizing preventive care, especially for children. The classification "all other" consists of hospitals devoted to treating some particular disease, or group of diseases, or some particular group in the population. Among the former are orthopedic, cancer, and eye, ear, nose and throat hospitals; the latter include children's and industrial hospitals.

Statistics on patients in hospitals for mental disease are available in annual reports *Patients in Mental Institutions*, issued by the Bureau of the Census.

**C 104-117. Hospital facilities by ownership or control, 1923-1945.** SOURCES: Same as for series C 92-103.

Local governmental hospitals refer to county, municipal, and joint city-county hospitals. The nonprofit hospitals which are not church-owned are generally controlled by associations of citizens or fraternal organizations. The proprietary hospitals are those operated for profit by individuals, partnerships, or corporations.

**C 118-119. Appropriations for and expenditures of the United States Public Health Service, 1798-1945.** SOURCE: Records of Budget and Fiscal Office, United States Public Health Service.

The Service was founded as the Marine Hospital Service in 1798 to provide care for sick and disabled seamen. This care was financed by a tax of 20 cents per month collected from all seamen employed on American vessels. For the first 14 years of its existence, the Service's only other source of revenue was an appropriation of \$1,000 in 1804. In 1884, the hospital tax was abolished and a tonnage tax substituted which was collected until 1906.

With time the medical officers of the Service were given additional duties, especially when epidemics occurred. In 1878, Congress authorized the Marine Hospital Service to cooperate with State and local health authorities in the control of disease. The act of 1893 in effect recognized the Marine Hospital Service as the Federal health service, and in 1902 the name was changed to Public Health and Marine Hospital Service. In the same year the research branch of the Service was established as the Hygienic Laboratory. The present name of the Service was given to it in 1912, and it was given the general authorization to investigate the diseases of man.

The expanding activities of the Service can be traced in the appropriations and expenditures from year to year. In 1893, there was a large appropriation for preventing the spread of epidemic disease. In 1918, a special appropriation was made for protecting the health of the military forces. The large amount for 1919 included funds for hospital construction which could be expended over 4 years. The appropriations for 1920, 1921, and 1922 included large sums for hospital care of veterans of World War I. The sharp drop in the amount appropriated for 1923 reflects the transfer of veterans' hospitals to the Veterans' Bureau. Special appropriations were made in 1931 and 1932 for health work in drought-stricken areas. With 1936, there began the appropriations under the Social Security Act for grants-in-aid to the States for the promotion of health services. During World War II appropriations were made to the Public Health Service for a variety of war-related activities, including the Cadet Nurse Corps, Malaria Control in War Areas, and Venereal Disease Control.

### Nutrition: Series C 120-155

**C 120-127. Food production and consumption indexes and nutrients available, 1909-1945.** SOURCE: See detailed listings below.

**C 120. Index of volume of food production for sale and for farm home consumption, 1909-1945.** SOURCE: Bureau of Agricultural Economics. This index was derived by weighting the quantities of the major farm-produced foodstuffs sold or used in farm households by average farm prices in 1935-1939.

**C 121. Index of per capita food consumption, 1909-1945.** SOURCES: See series C 128-155 below. This index was derived by weighting per capita consumption of food, retail weight equivalent, by average retail prices in 1935-1939. For method of estimating food consumption see series C 128-155 below.

**C 122-127. Nutrients available per capita per day, 1909-1945.** SOURCE: Bureau of Human Nutrition and Home Economics, *Nutritive Value of the Per Capita Food Supply, 1909-1945*, United States Department of Agriculture, Misc. Pub. No. 616, 1947.

These figures are averages for the total population, 1909-1940; and for the civilian population only, 1941-1945. Data are computed by the Bureau of Human Nutrition and Home Economics on the basis of estimates supplied by the Bureau of Agricultural

Economics, of apparent civilian consumption (retail basis) including estimates of consumption from urban gardens. No deductions have been made in the nutrient estimates for the loss or waste of food in the home, or for the destruction or loss of nutrients during the preparation of food. Deductions have been made for inedible refuse.

The computations were made by multiplying the estimated per capita quantity of each food consumed by appropriate food-composition figures. The composition values are those published in *Tables of Food Composition in Terms of Eleven Nutrients*, United States Department of Agriculture, Misc. Pub. No. 572, supplemented by a few unpublished values compiled by the Bureau of Human Nutrition and Home Economics.

Calories were estimated according to the Atwater system, which was developed for use with the average mixed diet in this country. This system results in higher caloric value than does the method of calculation used by the Medical Research Council of the United Kingdom, a point to be kept in mind when making comparisons of the energy value of food supplies. It has been estimated that the United Kingdom method gives figures about 150 calories lower per capita per day than would have been derived if the method of this analysis were used. See United States Department of Agriculture, *Food Consumption Levels in the United States, Canada and the United Kingdom, 1944*.

Within the last few years there has been enrichment or fortification of several types of foods with minerals and vitamins. Composition figures used include these added minerals and vitamins. Foods that are commonly enriched or fortified are white flour and bread, breakfast cereals, and margarine.

The consumption of vitamins and mineral preparations other than those used in the enrichment or in the fortification of foods mentioned is not included here. Quantities of calcium or other minerals added to flour to make it self-rising or phosphated are not included nor is the nutritive content of baking powder, yeast, or dough conditioner.

**C 128-155. Apparent civilian per capita consumption of food, 1849-1945.** (Meats, fats and oils, 1899-1945; dairy products, 1849-1945; poultry products, fruits and vegetables, wheat flour and coffee, 1909-1945; sugar, 1875-1945; peanuts, 1920-1945.) **SOURCES:** *National Food Situation*, issued quarterly by Bureau of Agricultural Economics. From the annual supply of each food (production plus beginning stocks, plus imports) are deducted feed and seed uses, industrial uses, exports and shipments, Government purchases, and ending stocks. The residual is taken as a measure of the quantities moving into domestic civilian consumption dur-

ing a given calendar year. Data used are from the following sources:

Item	Source of Data
Stocks.....	Bureau of Agricultural Economics, Department of Commerce, stock reports of Production and Marketing Administration, trade reports.
Production.....	Bureau of Agricultural Economics, Supply Estimates Committee of the Department of Agriculture, Fish and Wild Life Service of the Department of the Interior.
Foreign trade.....	Department of Commerce, shipment data of Production and Marketing Administration.
Nonfood use.....	Bureau of Agricultural Economics.
Military procurement.....	Special reports submitted to the Department of Agriculture.

Data on military takings during World War I were so incomplete that they could not be used. Accordingly, data on total domestic food "disappearance" for the years 1909-1940 were divided by the total population. For the years 1941-1945, the total food supplies available for civilian consumption were divided by the number of people eating from civilian supplies. Adjustments were made for members of the armed forces on leave or for other reasons eating in homes or restaurants in this country.

The basic disappearance data are in varied terms, such as the dressed weight of meats at the slaughter level and the farm weight of fresh fruits and vegetables. This results from the diversity in the levels of distribution at which data on production and utilization are currently available. However, such variation does not impede comparisons for a given food through time. Although disappearance data are not the same as consumption data, since they measure the quantities of food going into the distribution system instead of the quantities bought by consumers or consumed by consumers, they are the only available estimates of consumption. The possibility of error is present throughout, but the data are internally consistent. All disappearance data are on a national basis and no regional or State estimates can be made without the collection of much additional statistical information.

Some scattered data that are basic to estimates of apparent consumption have been gathered from decennial censuses prior to 1900. The food production data from the Census of Agriculture for 1910 were more complete, and are the first important benchmark for most food consumption estimates. The completeness and accuracy of the data have been greatly improved as the crop reporting system has developed. Data on consumption of major foods since about 1924 are viewed as much more reliable and comparable.

Series C 1-5.—VITAL STATISTICS—GROWTH OF BIRTH- AND DEATH-REGISTRATION STATES: 1900 TO 1945

YEAR	BIRTH-REGISTRATION STATES			DEATH-REGISTRATION STATES			YEAR	BIRTH-REGISTRATION STATES			DEATH-REGISTRATION STATES				
	Midyear population		Number of States <sup>1</sup>	Midyear population		Number of States <sup>1</sup>		Midyear population		Number of States <sup>1</sup>	Midyear population		Number of States <sup>1</sup>

<sup>1</sup> Number of births to women in specified race groups per 1,000 persons in the total estimated midyear population of that race group.

<sup>2</sup> Mexicans included with white each year except 1932, 1933, and 1934.

<sup>3</sup> Rates shown represent number of births to women in the specified age groups per 1,000 female population of that group, based on estimated midyear population.

<sup>4</sup> Includes births for which age of mother was not stated.

<sup>5</sup> Ratios are the number of stillbirths per 1,000 live births.

Series C 39-44.—VITAL STATISTICS—DEATH RATES, INFANT AND MATERNAL MORTALITY: 1915 TO 1945

[For birth-registration States. Mexicans included with white each year except 1932, 1933, and 1934]

<sup>1</sup> Mexicans included with white each year except 1932, 1933, and 1934.  
<sup>2</sup> Computed by direct method using age distributions of the total population enumerated in the United States in 1940 as the standard population.  
<sup>3</sup> Data for 1940 to 1945 are by place of residence; earlier years by place of occurrence.  
<sup>4</sup> Excludes armed forces overseas. For Massachusetts, 1940 male and female rates based on enumerated population, April 1.

Series C 56-64.—VITAL STATISTICS—DEATH RATES, SELECTED CAUSES: 1861 TO 1945

[Exclusive of stillbirths. Rates are number of deaths per 100,000 estimated midyear population]

<sup>1</sup> Calendar year data except where otherwise indicated.<sup>2</sup> Computed from rounded data. Includes fat content of butter, margarine, lard, shortening, and other edible oils.<sup>3</sup> Includes small quantity of lard used in manufactured products, 1899-1908; 1909-1945 excludes quantities so used.<sup>4</sup> Includes apples (commercial only 1934-1945), apricots, avocados, bananas, cherries, cranberries, figs, grapes, peaches, pears, pineapples, plums and prunes, strawberries, and citrus fruits.<sup>5</sup> Includes apples, applesauce, apricots, berries, cherries (including brined), cranberries, figs, fruit cocktail, grapefruit segments, olives (including brined), pineapples, plums, prunes, peaches, and pears. For 1909-1942, data are on a pack year basis beginning in year indicated.<sup>6</sup> Includes grapefruit, orange, blended citrus, and lemon juices (single strength juices 1930-1945; concentrated juices converted to single strength basis 1941-1945), pineapple, apple, grape and prune juices and fruit nectars. Prior to 1923 includes grape juice only. Citrus on basis of year beginning in November of year prior to that designated. Other juices on a calendar year basis.<sup>7</sup> Includes apples, apricots, Zante currants, dates, figs, peaches, pears, prunes, and raisins. Data are on a pack year basis beginning in year indicated.<sup>8</sup> Includes tomatoes, melons, asparagus, lima beans, snap beans, cabbage, carrots, kale, lettuce and escarole, green peas, green peppers, spinach, artichokes, beets, cauliflower, celery, sweet corn, cucumbers, eggplant, onions, shallots, and other miscellaneous vegetables. Includes commercial truck crops for fresh market shipment and rough approximations of quantities produced in farm and market gardens but does not include produce of town and city gardens.<sup>9</sup> Includes tomatoes, corn, peas, asparagus, lima beans, snap beans, beets, carrots, hominy, potatoes, sweetpotatoes, pickles (including bulk stock), pimientos, pumpkin and squash, sauerkraut (including bulk stock), spinach, tomato juice, pulp and puree, catsup, paste, sauce, and chili sauce, other greens and mixed vegetables (a mixture of two or more vegetables). Excludes baked beans, soups, and baby foods. For 1909-1942, data are on a pack year basis beginning in year indicated.<sup>10</sup> On a crop year basis beginning in October of preceding year.<sup>11</sup> On a calendar year basis.<sup>12</sup> Includes slaughter under the Emergency Government Relief Purchase Program in 1934-1935.<sup>13</sup> Year beginning July.<sup>14</sup> On fat solids basis. This production of total milk for human consumption differs from total farm production of milk in that the former excludes milk fed to calves but includes off-farm production, while the latter excludes off-farm production but includes milk fed to calves. Milk fed to calves and milk produced off farms are usually of approximately equal volume.<sup>15</sup> Fluid milk equivalent for fresh use, containing about 4 percent butterfat.<sup>16</sup> Canned weight. The evaporated milk is unskimmed, unsweetened, case goods; the condensed milk is unsweetened (plain condensed), unskimmed bulk goods; and sweetened condensed milk, unskimmed, case and bulk goods. Consumption of condensed milk has decreased from about 2.5 pounds in 1925 to 1.7 pounds in 1945.<sup>17</sup> Includes all kinds of cheese except cottage, pot, and bakers' cheese and full skimmed American.<sup>18</sup> Actual weight basis.<sup>19</sup> Chicken only 1909-1928, but turkey consumption was very small during that period.<sup>20</sup> Includes white, whole wheat, and semolina flour.<sup>21</sup> For year beginning September of year prior to that indicated. Excludes peanuts crushed for oil.<sup>22</sup> SOURCE: Henry Schultz, *Theory and Measurement of Demand*, p. 686. For the years 1875-1908 data from *Concerning Sugar* (loose-leaf service by United States Sugar Manufacturers Association), pp. E-54-A, B, C, D. These statistics were derived from Willett and Gray, *Weekly Statistics Sugar Trade Journal*.

## Chapter D. Labor Force, Wages, and Working Conditions (Series D 1-238)

### Labor Force: Series D 1-106

**D 1-7. Persons 10 years old and over gainfully occupied, in agricultural and in nonagricultural pursuits, decennially, 1820-1940.** SOURCE: Bureau of the Census, Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870-1940*, p. 142, and Release Series P-9, No. 11. These are census data based on complete enumerations of the population, except as noted below.

The 1940 data based on the labor force concept vary from the data obtained under the gainful worker concept in 1930 and earlier years; in part because of differences in definition, and in part because of differences in the types of questions upon which the data were based. The gainful worker statistics were obtained by means of questions regarding occupation rather than employment status. *Gainful workers* were persons reported as having a gainful occupation, that is, an occupation in which they earned money or a money equivalent, or in which they assisted in the production of marketable goods, regardless of whether they were working or seeking work at the time of the census.

The *labor force* is defined in the 1940 census on the basis of activity during the week of March 24 to 30, and includes only persons who were at work, with a job, seeking work, or on public emergency work in that week. The following are the most important types of persons for whom the 1940 labor force classification differed from the gainful worker classification used in previous censuses:

a. *Seasonal workers.*—Seasonal workers who were neither working nor seeking work at the time of the census were not included in the 1940 labor force. Such persons were counted as gainful workers in 1930 and earlier years if they reported an occupation.

b. *New workers.*—Persons without previous work experience seeking work during the census week, that is, new workers, were included in the 1940 labor force; such persons were probably for the most part not counted as gainful workers in earlier censuses. In 1930, however, the number of new workers was probably much smaller than at the time of the 1940 census.

c. *Retired and disabled persons.*—Persons unable to work and retired workers no longer working or seeking work were excluded from the labor force in the 1940 census. In earlier censuses such persons frequently reported their former occupations and were counted as gainful workers.

d. *Inmates of institutions.*—In the 1940 census all inmates of penal and mental institutions and homes for the aged, infirm, and needy were excluded from the labor force, regardless of their activity during the census week. In previous censuses inmates of these institutions were reported as gainful workers if they performed regular work in the institutions.

The comparison of the 1940 figures with those from earlier censuses is affected also by the fact that some persons who were actually working or seeking work at the time of the 1940 census were not counted as in the labor force because they failed to answer the employment status questions. Also, in earlier censuses many persons who were actually gainful workers were omitted from the enumeration because they failed to report their occupations. For a detailed comparison and analysis of the 1940 and 1930 data on the labor force, employment, and unemployment, see Bureau of the Census, Sixteenth Census Reports, *Estimates of Labor Force, Employment, and Unemployment in the United States, 1940 and 1930*.

These differences probably do not seriously affect the comparison of the total labor force in 1940 with the total number of gainful workers in 1930 and earlier years, since the groups classified as in the labor force but not counted as gainful workers at least partly

offset the groups in which the opposite difference occurred. However, in order to increase the validity of historical comparisons, the following adjustments have been made in the 1940 census figures shown in series D 1-7: New workers have been excluded; children 10 to 13 (estimated) engaged in agricultural and non-agricultural pursuits have been included; persons on public emergency work previously in agricultural pursuits (estimated) have been included; the number of persons classified in agricultural pursuits was revised as a result of the occupation classification revision in 1940. Because of these adjustments, the 1940 data shown here may differ from other published 1940 data.

In addition to the above changes, the original census data for 1920, 1910, and 1870 were adjusted for underreporting and over-reporting. For a discussion of the adjustments, see *Comparative Occupation Statistics for the United States: 1870-1940*, pp. 137-141.

The figures in series D 2-5 for 1820 to 1860 (except 1830) are estimates based on census returns covering most, but not quite all, of the population. The 1830 figures are interpolations between 1820 and 1840.

**D 8-10. Total and married women in labor force or gainfully occupied, 15 years old and over, decennially, 1890-1940.** SOURCE: Bureau of the Census, Sixteenth Census Reports, *Population*, vol. III, part 1, p. 26, and vol. IV, part 1, p. 90; and Fifteenth Census Reports, *Population*, vol. IV, p. 68. Figures for 1940 have been revised since original publication. For statement of revision procedure, see Bureau of the Census, *Current Population Reports*, Series P-50, No. 2. For definitions of labor force and gainfully occupied, see text for series D 1-7.

The data on marital status refer to the status at the time the census was taken. A person who was widowed or divorced but has remarried is reported as married. The 1940 census gives separate figures for married females, husband present; and married females, husband absent. The other censuses give only the total of all married females. All the censuses contain data on single, widowed, and divorced females and number in each category who are workers.

Because of differences in procedures in the 1910 census, figures for gainfully occupied persons for 1910, especially for women, are too high for exact comparability with those for adjacent census years.

**D 11-31. Total in labor force, and employment status, 1940-1945.** SOURCE: Bureau of the Census, *Current Population Reports*, Series P-50, No. 20.

For current statistics, see *Current Population Reports*, "Monthly Report on the Labor Force," issued monthly by the Department of Commerce, Bureau of the Census. The figures shown here reflect recent revisions (September 1947) made by the Bureau of the Census in the estimates for months prior to July 1945.

Information on the employment status of the population 14 years old and over is obtained by the Bureau of the Census through personal interviews each month with a sample of about 25,000 households throughout the country selected by scientific sampling methods. The monthly data relate to a particular week of the month, specifically, the calendar week (Sunday to Saturday) which contains the 8th day of the month. The annual average figures shown in series D 11-31 are the arithmetic means of these monthly data.

Following are definitions of the terms used in the presentation of these materials:

a. *Employed.*—Employed persons comprise those who, during each month's survey week are either (1) "At work"—

those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or business; or (2) "With a job but not at work"—those who did not work a were not looking for work but had a job or business from which they were temporarily absent because of vacation, illness, industrial dispute, bad weather, or layoff with definite instructions to return to work within 30 days of layoff. Also included are persons who had new jobs but had not yet started to work.

b. *Unemployed*.—Unemployed persons include those who did not work at all during the survey week, and who were looking for work. Also included as unemployed are persons who would have been looking for work except that (1) they were temporarily ill, (2) they expected to return to a job from which they had been laid off for an indefinite period, or (3) they believed no work was available in their line of work in the community. During the 1940-43 period persons at work on or assigned to public emergency work projects were also included among the unemployed.

c. *Labor Force*.—The *civilian labor force* comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. Figures on the *net strength* of the armed forces are added to the civilian labor force to obtain the *total labor force*.

d. *Not in labor force*.—All persons 14 years of age and over who are not classified as employed or unemployed are defined as "not in the labor force." This group largely consists of persons engaged in own home housework, persons in school, retired persons, those permanently unable or too old to work, seasonal workers for whom the survey week fell in an "off" season, and the voluntarily idle. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

In using the Census Bureau data on labor force, employment, and unemployment for the 1940-1945 period in conjunction with the data on gainful workers, employment, and unemployment shown in other series (see text for those series) particular attention should be paid to the difference in gainful worker and labor force concepts which may affect comparability. For a discussion of the differences between the gainful worker and labor force concepts, see text for series D 1-7. Other differences to be noted are those in the age of the population covered and date reference of the figures, that is, annual average or census date.

D 32-46. *Sex and age of persons in labor force and gainful workers, decennially, 1890-1940*. SOURCE: Bureau of the Census, Sixteenth Census Reports, *Population*, vol. III, part 1, p. 26, and *Comparative Occupation Statistics for the United States, 1870-1940*, p. 93. Figures for 1940 have been revised since original publication. See Bureau of the Census, *Current Population Reports*, Series P-50, No. 2. For definitions of labor force and gainful worker, see text for series D 1-7.

The 1890 to 1930 censuses contain data on the number of gainful workers, by sex, between the ages of 10 and 15. The 1940 census contains data on the number of persons in the labor force, by sex, in the 14-15 age group. Because of the noncomparability of data on persons under 16 years of age between the 1940 and earlier censuses these data were not included here. Information on these age groups under 16 may be found in the two sources listed above.

In 1870 and 1880, the age classification of gainful workers was limited to three age groups—10 to 15, 16 to 59, 60 and over—which precludes comparability with later censuses. These data may be found in Ninth Census, vol. I, *Population*, p. 704, and Tenth Census, *Population*, p. 714.

The age classification in census statistics is based on age at last birthday; that is, age in completed years. In the 1940 census tabulations the category "age unknown" (series D 46) was avoided in that when the age of a person was not reported, it was estimated on the basis of other information on the population schedules, such as marital status, school attendance, employment status, age of other members in the family, etc.

For 1920 and 1910 the original census data were adjusted for overreporting or underreporting. For a discussion of the derivation of the figures see *Comparative Occupation Statistics for the United States, 1870-1940*.

D 47-61. *Industrial distribution of gainful workers, decennially 1820-1940*. SOURCE: Fabricant, Solomon, *The Changing Industrial Distribution of Gainful Workers: Some Comments on the American Decennial Statistics for 1820-1940*, a paper presented at the Conference on Research in Income and Wealth, November 1946. The data are based almost entirely on estimates in the following monographs which were prepared mainly from data collected in the decennial Census of Population: Whelpton, P. K., "Occupational Groups in the United States, 1820-1920," *Journal of the American Statistical Association*, Sept. 1926; Edwards, Alba M., *Comparative Occupation Statistics for the United States, 1870 to 1940*, Bureau of the Census, Sixteenth Census Reports, Population, 1940; and Carson, Daniel, *Industrial Composition of Manpower in the United States, 1870-1940*, a paper presented at the Conference on Research in Income and Wealth, Nov. 1946.

D 62-65. *Gainful workers and employment status, 1900-1945*. SOURCE: National Industrial Conference Board, *The Economic Almanac for 1946-1947*, New York, pp. 262, 268, 269. For census data for 1940-1945 see series D 11-31.

The National Industrial Conference Board series in general are tied to decennial censuses and are adjusted for long-term population changes and shifts in school attendance during inter-censal years. No allowance is made, however, for the temporary entrance and withdrawal of students and other occasional workers into the labor market.

For decennial census years, the data in the series may not agree with the data in series D 1-7, because revisions made in series D 1-7 were not made in series D 62-65. Also, the data shown here may not agree with the data shown in series D 11-31 for the time period 1940-1945, because of the difference in definitions used and in methods employed in obtaining the information. The data in series D 62-65 are derived by projecting past trends into the future while the data for series D 11-31 are based on direct monthly measurements. Finally, the National Industrial Conference Board concepts involve the possibility of negative unemployment (see tabular footnote 2, series D 65, for explanation); in the Census Bureau series unemployment is measured directly and is always a positive figure.

D 66-76. *Industrial distribution of the employed, 1900-1945*. SOURCE: National Industrial Conference Board, *The Economic Almanac for 1946-1947*, New York, pp. 263-264.

D 77-89. *Gainful workers, social-economic groups, decennially, 1910-1940*. SOURCE: Bureau of the Census, Sixteenth Census Reports, Population, *Comparative Occupation Statistics for the United States, 1870-1940*, table XXVII, p. 187. The experienced labor force consists of the labor force excluding new workers; the latter are unemployed persons who had not previously worked full time for one month or more. See text for series D 1-7 for definitions of labor force and gainful workers.

D 90-106. *Selected occupations of gainful workers, 1870-1940*. SOURCE: Bureau of the Census, Sixteenth Census Reports, Population, *Comparative Occupation Statistics for the United States, 1870-1940*, table 3 pp. 59-62, and table 8, pp. 104-112. The 1870-1930 data have been adjusted for comparability with the 1940 classification system; minor variations should be disregarded as many of the adjustments, especially for the 1870-1900 data, were necessarily based on rough estimates. See text for series D 1-7 for definition of gainful workers and labor force. For definition of experienced labor force, see text for series D 77-89, above.

### Hours, Wages, and Earnings: Series D 107-212

D 107-110. *Average hours per day and index of average wages per day in all nonagricultural employments and in building trades, 1860-1891*. Index base: 1860=100. SOURCE: United States Congress, Senate Committee on Finance, *Report on Wholesale Prices, on Wages, and on Transportation*, (Aldrich Report) Senate

Report No. 1394, 52d Congress, 2d Session, 1893, part I, pp. 173-180. Information regarding hours, wages, and earnings before 1890 is fragmentary except for the data contained in this 4-volume report. These four volumes give daily rates of wages and hours per day for numerous occupations in separate establishments in 22 industries for the period from 1840 to 1891, together with special data for the same period regarding wages in coal, iron, glass, and pottery, and teachers' salaries in certain areas.

Most of the information contained in the Senate Report (commonly called the Aldrich Report) was collected under the supervision of the Commissioner of Labor, and summarized in part I of the report, pp. 110-190. The figures were derived from records collected in the early nineties from 88 establishments existing throughout the period from 1860 to 1891 in manufacturing, building trades (then included in the censuses of manufactures), railroads, retail trade, and public works. Occupational wages in each establishment were converted to relatives; these relatives in each industry were combined as a simple average; and the industry averages were combined by the use of employment weights. The weights used were changing weights derived from the several censuses up to 1880. The wages of common laborers were included in some of the industries but the general index of wages is preponderantly an index of the wages of the skilled and semiskilled workers covered by the survey. Indexes are given in the source for 1840-1860 but the coverage is so inadequate that the results before 1860 are of little general interest or value. Building trades were comparatively well represented in the series, with 25 of the 88 establishments.

**D 111-116. Indexes of average wages, hours, and earnings in manufacturing, 1890-1907.** Base: 1890-1899=100. SOURCE: Department of Commerce and Labor, *Bulletin of the Bureau of Labor*, No. 77, July 1908, pp. 1-24, 126. The Bureau of Labor of the Department of Commerce and Labor undertook, in modified form, a continuation of the Senate Committee on Finance study on wages and hours (Aldrich Report, see text for series D 107-110). The *Nineteenth Annual Report of the Commissioner of Labor*, 1904, entitled *Wages and Hours of Labor* (Washington, D.C., 1905), contains the results of the studies for the period from 1890 to 1903. Similar surveys were made for subsequent years to 1907, and the information for the entire period from 1890 to 1907 was summarized in the source volume referred to above.

The information is described as covering the wages and hours of labor in manufacturing industries. Manufacturing included such "hand and neighborhood industries" as the building trades and blacksmithing. Occupational averages were computed as absolutes for each year; the occupational relatives in each industry were computed by use of percentage changes in identical establishments. Industry relatives were computed by combining the occupational relatives, equal weight being given to each occupation. The industry relatives were combined, in turn, on the basis of the aggregate wages paid in each industry as reported by the Census of 1900 for 1899, the largest industry, as then defined, being the building trades. Laborers, as distinguished from skilled workers, were covered in many of the industries, but the general plan called for "securing data for only the important and distinctive occupations which are considered representative of each industry."

**D 117-119. Average hourly earnings, weekly hours, and weekly earnings of production workers in manufacturing, 1909-1945.** SOURCE: Bureau of Labor Statistics, *Handbook of Labor Statistics*, 1947 edition, Bulletin No. 916, p. 57; and *Monthly Labor Review*.

Monthly compilations of data on average hourly earnings and average weekly hours of work in manufacturing industries were begun by the Bureau of Labor Statistics in 1932, and subsequently carried as far back as 1909. Use was made in the earlier series of the numerous wage and hour reports of the Bureau of Labor Statistics, the Bureau of the Census reports, and various other official sources. Supplementary use was made of such unofficial sources as

the pioneer work on wages and hours in 25 manufacturing industries by the National Industrial Conference Board.

Current data on average weekly hours, average hourly earnings, and average weekly earnings in manufacturing industries are published monthly in the *Monthly Labor Review* by the Bureau of Labor Statistics; information is presented for 135 industries, and 20 major groups of industries, as well as for durable and nondurable goods groups and for all manufacturing industries combined. The data are based on monthly reports from some 35,000 cooperating establishments and cover both full- and part-time production workers who worked or received pay during any part of the pay period ending nearest the 15th of the month. The annual figures shown are the simple arithmetic averages of the monthly averages.

The monthly reports from employers state the number of production workers, the amount of wages paid, and the number of hours actually worked. Vacation hours are included as time worked and vacation pay is included as pay earned. As not all reporting firms furnish man-hour data, average hours and average hourly earnings for individual industries are based on a slightly smaller sample than are weekly earnings. Tabulations prepared from the monthly reports include only those schedules for which corresponding data were available in the preceding month.

For the 20 major groups, for the durable and nondurable goods groups, and for all manufacturing, weighted averages are obtained as follows:

The average for each individual industry is given a weight equal to the estimated number of production workers in that industry; in deriving the group average of hourly earnings, the earnings for each industry are weighted by estimates of the total number of hours worked in that industry for the week covered.

The weekly earnings average for each group is obtained by multiplying the weighted average of weekly hours by the weighted average of hourly earnings. Note that the weekly-earnings figures for the groups are not weighted averages of the weekly earnings for individual industries.

**D 120. Index of production-worker pay rolls in manufacturing industries, 1919-1945.** Base: 1939=100. SOURCE: Department of Labor, Bureau of Labor Statistics, *Handbook of Labor Statistics*, 1947 edition, Bulletin No. 916, pp. 21-22; and *Monthly Labor Review*.

This index relates to the aggregate payrolls of production workers in manufacturing industries. The Bureau of Labor Statistics' indexes of factory pay rolls for the period up to 1922 are estimated on the basis of returns from 13 industries. In 1922, the number of industries surveyed was increased and extensive additions have been made periodically since that time. At present (early 1947), 153 manufacturing industries are included.

In compiling the indexes of factory pay rolls the BLS makes a mail canvass of manufacturing establishments except where data are collected by State agencies, in which case the Bureau makes use of the reports collected by these various cooperating agencies. The monthly tabulations are based on reports from identical establishments supplying information for both the current and the preceding month. The annual averages are arithmetic averages of the figures for the 12 months.

Some 35,000 cooperating establishments submit employment and pay roll data each month covering all full- and part-time production workers who worked or received pay during any part of the pay period ending nearest the 15th of the month. Pay rolls as reported to the BLS include employee contributions for old-age benefits, unemployment insurance, and group insurance. Not included are the estimated value of free rent, fuel, and other payments in kind. Bonus payments, unless earned and paid regularly each pay period, are excluded.

The number of reporting establishments varies from month to month, as some firms fail to supply information in time for the tabulation. Because of the variation in the coverage of the samples for industries and to avoid either overrepresenting or underre-

presenting the different groups, each industry group is assigned a weight equivalent to its proportionate importance, in manufacturing as a whole, in terms of pay roll.

**D 121-133. Hours, wages and earnings: All industry, manufacturing, and skilled, unskilled, and farm labor, 1890-1926.** SOURCE: Douglas, Paul H., *Real Wages in the United States, 1890-1926*, Houghton Mifflin Company, New York, 1930, pp. 108, 116, 135-136, 175, 177, 180, 182, 186, 205, 208.

**D 134-144. Average annual earnings in all industries and in selected industries, 1890-1926.** SOURCE: Same as for series D 121-133, unnumbered pages following p. 392 of source volume.

**D 145-212 (except D 148-151 and D 172-176). General note. Hours and earnings in selected industries.** SOURCE: Department of Labor, Bureau of Labor Statistics. See second paragraph of this note and also detailed listing for the several series.

After the annual series relating to wages and hours for 1890-1907 (see text for series D 111-116) were discontinued, the Bureau of Labor (which in 1913 became the Bureau of Labor Statistics of the Department of Labor) undertook a series of studies of wages and hours in selected industries, usually repeating the study for a particular industry on a biennial basis. These industry studies, which were continued in most instances until the early 1930's, make possible summary analyses of average hourly earnings, average full-time weekly hours, and average full-time weekly earnings for a number of industries, and for certain occupations in some of the industries, for considerable periods of time.

Studies of industries which lend themselves particularly to summary analyses include cotton goods (*Wages and Hours of Labor in Cotton Goods Manufacturing, 1910 to 1930*, Bulletin No. 539); woolen and worsted goods (*Wages and Hours of Labor in Woolen and Worsted Goods Manufacturing, 1932*, Bulletin No. 584); the hosiery and underwear industries (*Wages and Hours of Labor in the Hosiery and Underwear Industries, 1932*, Bulletin No. 591); boots and shoes (*Wages and Hours of Labor in the Boot and Shoe Industry, 1910 to 1932*, Bulletin No. 579); and blast furnaces, steel works, and rolling mills (*Wages and Hours of Labor in the Iron and Steel Industry, 1931*, Bulletin No. 567).

The initial purpose of the industry studies of wages and hours was primarily an analysis of the occupational wage structure of a given industry during normal pay periods. The information was obtained by agents of the Bureau of Labor Statistics from the pay rolls of selected establishments. The averages were computed not for the entire year but for a limited period, usually including several weeks, a single pay period being chosen for each plant surveyed. The Bureau, in the course of the development of its surveys, expanded the occupational coverage to include unskilled or common laborers. The series included here have for the most part substantially comprehensive coverages, so that the averages are substantially industry averages rather than the averages of selected occupations. The various bulletins giving details of the several surveys of particular industries contain information of value in the study of occupational wage rates by industry and by area. In the industries other than those mentioned above, the available information does not lend itself readily to the construction of time series of industry averages.

The work of the Bureau of Labor Statistics in the field of wages and hours underwent a significant change in 1932, when monthly series of average hourly earnings, average weekly earnings, and average weekly hours were initiated on an industry basis for most of the manufacturing industries and for many of the nonmanufacturing industries. These averages are derived from extensive reports to the Bureau of employment, pay rolls, and man-hours for the pay-roll period ending nearest the middle of the month. It has been found possible to construct these three series of average earnings and hours for manufacturing as a whole and for bituminous-coal mining for periods antedating the series beginning in 1932. (For the manufacturing series, see text for series D 117-119.)

**D 145-147. Hours and earnings, bituminous coal mines, 1909-1945.** SOURCE: Department of Labor, Bureau of Labor Statistics. Estimates of hours and earnings in bituminous-coal mining before 1932 are derived from a variety of sources, including special wage studies by the Bureau of Labor Statistics, data collected by the Bureau of the Census and the Bureau of Mines, and reports of various coal commissions. Weekly hours are not scheduled or standard hours but the actual hours worked; the averages reflect the effects of such factors as part time, overtime, and labor turnover. Average weekly earnings are affected by similar factors. Travel time in mines was reported as working time and therefore compensable time beginning in 1944. Payment for travel time involved no change in basic rates except for certain equalization adjustments of the wages of outside workers; and average hourly earnings are computed, under the new travel-time rule, by dividing total compensation by man-hours, including travel time.

**D 148-151. Hours and earnings, Class I steam railroads, 1921-1945.** SOURCE: Interstate Commerce Commission, *Wage Statistics of Class I Steam Railways in the United States*.

In the field of railroad transportation, the Interstate Commerce Commission has regularly collected and published the basic statistics relating to wages, hours, and employment. Average weekly earnings, average weekly hours, average hourly earnings, and straight-time hourly earnings can be derived from the Commission's *Wage Statistics of Class I Steam Railways in the United States* (currently published as statement No. M-300 on a monthly and an annual basis). The averages presented here cover employees classified and reported to the Interstate Commerce Commission on an hourly basis (excluding most of the executive, professional, and supervisory employees).

Average weekly earnings and average weekly hours are the averages of hourly rated employees on the pay rolls during the month. For years before 1933, the full-month count was computed by ratio adjustment of the middle-of-the-month count, a virtually constant ratio as indicated by figures of both counts available after 1932. In most of the series of weekly hours and weekly earnings for other industries, the averages are those of employees on the pay rolls during the pay-roll period ending nearest the middle of the month.

Average hourly earnings are computed by dividing total pay rolls of hourly rated employees by the total man-hours paid for, including hours not on duty, insignificant except among road train and engine crews. Straight-time hourly earnings are computed by the Interstate Commerce Commission. The averages for 1921 to 1927 were computed by dividing compensation for "straight time actually worked" by hours of "straight time actually worked." Beginning in 1928, the averages were computed by dividing compensation for "straight time paid for" by hours of "straight time paid for." The two methods give virtually identical results. During World War II, the differences between gross average hourly earnings and the straight-time averages were small as compared with differences in manufacturing and various other industries. Premium pay for overtime begins in most of the railroad employments after 48 hours per week. Part of the increase in wages in 1943 and 1944 was "in lieu of claims for time and one-half pay for time worked over 40 hours per week."

**D 152-163. Indexes of union hourly wage rates and weekly hours, building and printing trades, 1907-1945.** Base: 1939=100. SOURCE: Department of Labor, Bureau of Labor Statistics annual reports, *Union Wages and Hours in the Building Trades*, and *Union Wages and Hours in the Printing Trades*.

Although these series cover only the building and printing trades, annual reports for the years 1907 to 1928, entitled *Union Scales of Wages and Hours*, included under one cover at various periods data on the local transit, trucking, baking, metal millwork, soft drink, brewing, theatrical, restaurant, laundry, longshore, and barber trades, in addition to building construction and printing. In 1929, 1930, and 1931, an effort was made to obtain wage and

hour data from all labor organizations in the United States. Some data were obtained from all groups, but the effort was not entirely successful as a few organizations were unable or unwilling to furnish adequate data. In 1932 and 1933, the studies were restricted to building, printing, baking, trucking, laundry, longshore, and linemen trades. There was no study in 1934, but in 1935, the industries studied in 1932 and 1933 were again covered and 1934 data were also obtained. Since 1936, emphasis has been placed on the building, printing, local transit, trucking, and baking industries, and individual annual reports have been published for each industry since that time. The index series for building construction and printing start with 1907, while those for local transit, trucking, and baking, because of inadequacies in available data for earlier years, begin with the years 1929, 1936, and 1939, respectively. The annual reports, in addition to providing the trend information for past years, also serve as a reference for current scales among the various trades and cities studied.

The indexes are based on union scales. A union scale may be defined as a minimum wage rate or a schedule of maximum standard hours agreed upon by negotiation between employers and trade-unions. Rates in excess of the agreed minimum, although frequently paid in reward for long service, for special qualifications, or for personal or other reasons, were not used in the computations. Also excluded were the scales applying to apprentices. It should be noted that the indexes relate to union rates, which may or may not be the prevailing rates in a locality, depending on the extent of local union organization. During depression periods, union wage scales may have been higher than the actual rates paid to significant proportions of the tradesmen. If it was established that at least 50 percent of the union members received the union rate, the scale was given recognition in the annual reports. The indexes are limited to the movements of basic scales and consequently are not intended to measure such factors as movement of earnings or take-home pay.

The studies from 1907-1912 covering 39 cities included 14 journeymen and 4 helper and laborer trades in building construction, and 7 book and job and 4 newspaper occupations in the printing industry. The scope was gradually expanded until, by 1941, 27 journeymen and 10 helper and laborer trades in building construction, and 11 book and job and 8 newspaper classifications in printing, in 75 principal cities, ranging in population from 40,000 to over 1,000,000, were included. The data reflected in the indexes were collected by field representatives of the Bureau of Labor Statistics directly from officials of the local trade-unions concerned. In cases where the information submitted appeared questionable, the data were checked with the other parties to the agreement. For many years, scales collected were those in effect on May 15. The survey date was changed to June 1 in 1939 and to July 1 in 1942.

The index, utilized for trend determination purposes, links each pair of years and may be termed a "chain" index. Year to year changes are computed from aggregates of the quotations of unions which furnish scale data for identical classifications in two consecutive years. The membership weights in both of the aggregates used for each year to year comparison are those reported for the second year. The total of the current aggregates (membership times rate) is then divided by the total of the previous year's aggregates. The ratio so obtained is multiplied by the previous year's index number, and the resulting figure is the current index number.

The method described above was used in computing indexes for the years 1907 to 1920 and from 1930 to the present. The series for the years 1921-1929 were simply indexes of average rates for each year, computed by dividing the average rates by the averages for the base year and multiplying by 100. The averages used in each case were weighted by the number of active members for that year in each local union covered by the reported rates. These weights, therefore, changed from year to year with changes in membership. Such an index, in which the changing union mem-

bership is an important factor, may be somewhat misleading. Thus, for instance, if the membership of high-rate unions increases or the membership of low-rate unions decreases, the index will rise even if there is no change in the scales of the individual unions. In 1936, the index series were revised to minimize the influence of such changes in membership or coverage which might distort real changes in scales. The method of computing the series for 1921-1929 remained unchanged because the necessary basic data were not available for adjusting the series. Indexes for these years, however, have been linked into the longer series upon the determination that changes in composition of active union membership during this period were so small as to render slight the extent of error due to lack of revision.

### Productivity: Series D 213-217

**D 213-217. General note. Productivity indexes for selected industries, 1880-1945.** Base: 1939=100. SOURCE: See detailed listings below.

Work in the field of productivity has been carried on by many individuals and by many organizations, and especially by the Bureau of Labor Statistics, Department of Labor; the W. P. A. National Research Project, and the National Bureau of Economic Research. Currently, extensive continuing work is being done by the Bureau of Labor Statistics, which publishes annual indexes of output per man-hour and output per wage earner for some 30 manufacturing industries, 6 mining industries, and for the electric light and power, telephone, telegraph, and railroad-transportation industries. Indexes of output per worker for agriculture for the United States as a whole and for 11 farming areas are also published by that Bureau. In addition, it has instituted direct productivity reporting programs in a number of manufacturing in-

dustries, which should substantially increase the amount of current data available.

In all instances, the indexes in series D 213-217 were computed by dividing a production index by an index of man-hours or of employment. In general, the man-hours indexes are prepared from indexes of employment and data for average weekly hours of work.

The indexes presented here measure output, in physical units, per man-hour of work (or per worker, in the case of agriculture). *Productivity*, as used here, refers to the relationship between the volume of goods produced and one factor of input—labor time. The indexes do not measure the specific contribution of labor or of capital or of any other factor of production. Changes in the ratio between output and man-hours of work show the joint effect of a large number of separate though interrelated influences. The long-term upward trend of output per man-hour is due mainly to technical improvements in industry. At any time, however, output per man-hour also depends on such factors as the rate of operations, the relative contributions to production of establishments at different levels of efficiency, the types of resources and materials available, and the flow of materials, as well as the skill and effort of the work force, the efficiency of management and the state of labor relations.

**D 213. Index of output per man-hour in all manufacturing, 1909-1939.** Base: 1939=100. SOURCE: For 1909 and 1914, see below; for 1919-1939, see Bureau of Labor Statistics, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919-1940*. See also general note for series D 213-217.

The production index used to derive the index of output per man-hour in manufacturing for the years 1909, 1914, and for the odd-numbered years 1919-1939, is from Fabricant, Solomon, *Employment in Manufacturing, 1899-1939*, National Bureau of Economic Research. The production index for even-numbered years was computed by means of the Federal Reserve Index for Manufactures. The man-hours index was derived from an employment index based on Bureau of the Census and Bureau of Labor Statistics data and the Bureau of Labor Statistics series for average weekly hours for 1909, 1919, and 1923-1939, supplemented with estimates of the W. P. A. National Research Project for 1920-1922.

For the period before 1936, indexes of productivity are shown in *Production, Employment, and Productivity in 59 Manufacturing Industries, 1919-1936*, a 3-volume report prepared by the W. P. A. National Research Project on Reemployment Opportunities and Recent Changes in Industrial Techniques. The Bureau of Labor Statistics made some revisions in these indexes and extended most of them to 1940. These measures, together with indexes of pay rolls and unit labor cost, appear in the Bureau of Labor Statistics report, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919-1940*.

The production pattern changed radically when the United States began its World War II program. It is not possible to measure over-all changes in manufacturing efficiency during the period of transition from peace to war; that would require equating of ships, planes, and munitions, for example, against automobiles and typewriters. The Bureau of Labor Statistics has, however, published indexes of output per wage earner and output per man-hour which extend through the war period for some 30 nonmunitions manufacturing industries. These indexes are shown in the release, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1939-1945*, (mimeographed) May 1946. The indexes are in process of revision and extension through 1946.

**D 214. Index of output per man-hour in railroad transportation, 1916-1945.** Base: 1939=100. SOURCE: Figures for 1916-1934 are based on Witt Bowden, "Productivity, Hours, and Compensation of Railroad Labor, 1933 to 1936," *Monthly Labor Review*, July 1937; for 1935-1945, see Bureau of Labor Statistics, *Productivity*

*and Unit Labor Cost in Steam Railroad Transportation: 1935-1946* (mimeographed). See also general note for series D 213-217.

The index of output per man-hour for railroad transportation refers to Class I steam line-haul railroads. For 1935-1945 the production measure represents aggregate passenger miles and freight-ton miles, each category being weighted by average unit revenues in 1939. The man-hour index is based on total straight-time actually worked, all overtime paid for, and constructive-allowance hours of train and engine employees. All basic data are published by the Interstate Commerce Commission. The indexes for the earlier period, 1916-1934, are based on a somewhat different index prepared by the Bureau of Labor Statistics.

**D 215. Index of output per man-hour in mining, 1880-1945.** Base: 1939=100. SOURCE: Figures for 1880-1934 are based on W. P. A. National Research Project, *Production, Employment, and Productivity in the Mineral Extractive Industries, 1880-1938*; for 1935-1945, see Bureau of Labor Statistics, releases on productivity and unit labor cost for the various mining industries. See also general note for series D 213-217.

From 1935 through 1945, the index for mining represents 6 individual mining industries for which the Bureau of Labor Statistics published separate series—bituminous coal, anthracite, crude petroleum and natural gas, iron, copper, lead and zinc. The production index, from which the combined index is derived, is an average of the separate series weighted with current man-hours; the man-hours index is based on totals for the 6 industries. The productivity index for the years before 1935 is based on the W. P. A. National Research Project study.

The individual series, from which the Bureau of Labor Statistics index was prepared, are published annually in a release *Productivity and Unit Labor Cost in Selected Mining Industries*. The production data for these series are from the United States Bureau of Mines. Employment and average weekly hours series are those of the Bureau of Labor Statistics for 1939-1945 for the 6 industries. For 1935-1939, Bureau of Labor Statistics series were used for the coal industry and Bureau of Mines data for metal mining. The employment definition adopted—average number of wage earners employed during the 12 months of each year, including months of no activity—is the concept used by the Bureau of the Census.

**D 216. Index of output per man-hour in electric light and power, 1917-1945.** Base: 1939=100. SOURCE: Bureau of Labor Statistics, *Productivity and Unit Labor Cost in the Electric Light and Power Industry: 1917-1946*. See also general note for series D 213-217.

The index for the electric light and power industry refers to privately-owned utilities and shows the trend of kilowatt-hours of electric energy distributed per man-hour of work. The production index is based on data from the quinquennial Census of Electrical Industries (suspended since 1937) and represents kilowatt-hour sales to ultimate consumers. Electricity generated by privately-owned utilities, as reported by the Federal Power Commission, was used as an interpolating series before 1937 and for all current years. All wage and salary employees, except main executives and employees of appliance sales departments, are included in the employment index.

**D 217. Index of output per worker in agriculture, 1909-1945.** SOURCE: For 1909-1942, see Bureau of Labor Statistics, *Productivity in Agriculture, 1909-1942*, Nov. 1943; for 1943-45, see same, *Productivity in Agriculture, 1942-1946*, December 1947. See also general note for series D 213-217.

These BLS reports present indexes for the United States as a whole and for 11 farming areas. The production index, used to derive the productivity index, is based on data of the Bureau of Agricultural Economics for the output of 73 farm products during the years 1936-1945. For the earlier period, 1909-1935, the series was derived from indexes prepared by the W. P. A. National Research Project and published in the reports, *Trends in Size and*

*Production of the Aggregate Farm Enterprise, 1909-1936, and Trends in Employment in Agriculture, 1909-1936.*

## Union Membership and Work Stoppages: Series D 218-238

### UNION MEMBERSHIP (D 218-223)

**D 218-223. General note.** Labor union membership in the United States, 1897-1945. SOURCE: Bureau of Labor Statistics records. See also detailed listing for the individual series.

The membership series are based upon reports and statements issued by the trade-union organizations in their official journals, reports, or convention proceedings, since there are no official Government statistics covering trade-union membership for the United States. "Union membership" is defined differently by various unions and the data are, therefore, not strictly comparable. The trend series, however, reasonably reflects year-to-year changes within each major union group.

Many unions whose headquarters are in the United States also have locals outside the continental United States, primarily in Canada. However, separate breakdowns of membership, by countries, are not available; the data therefore include a union's total membership irrespective of where located. *The Thirty-fourth Annual Report on Labor Organization in Canada*, published by the Canadian Department of Labor and covering the calendar year 1944, reported 468,013 Canadian workers as members of international unions whose principal offices were in the United States.

Figures for the American Federation of Labor are those reported annually by the Federation's secretary-treasurer (e. g., see Report of the Proceedings of the 65th Convention of the American Federation of Labor, 1946, p. 43). These membership data are defined by the AFL as the "total paid membership of the affiliated national and international organizations and the directly chartered trade and federal labor unions" based "on the actual per capita tax" remitted by affiliated unions.

The Congress of Industrial Organizations was formally organized in 1938. It existed as a Committee for Industrial Organization from November 1935 to November 1938. The CIO has never made public a consecutive membership series. The figures shown, therefore, are based upon reports or statements of CIO officials as to total membership or reported gains over a specified period.

The third broad category of union membership includes labor organizations which are not affiliated with either the AFL or the CIO. In general, this group of "independent" or "unaffiliated" unions includes all bona-fide national labor organizations and excludes those which are either purely local in character or whose jurisdiction does not extend beyond the employees of a single employer. In addition to the long-established four train and engine service railroad brotherhoods, this group includes a relatively large but fluctuating number of small labor organizations. In recent years changes in affiliation of certain large labor organizations, such as the United Mine Workers of America and the International Association of Machinists, have also influenced the membership totals of the different groups.

In conjunction with membership statistics the number of affiliated unions of the AFL and CIO are also compiled from official union sources. Similar data for independent unions are not available.

**D 221. Number of affiliated CIO unions, 1937-1945.** SOURCE: Compiled from *Proceedings of annual conventions of the CIO*. See general note for series D 218-223.

**D 222. Total CIO membership, 1937-1945.** SOURCES: For 1937-1944, see *Proceedings of the Constitutional Conventions of the CIO*; for 1945, see CIO Department of Research and Education, *Economic Outlook*, November-December 1945. See general note for series D 218-223.

**D 223. Total membership of independent or unaffiliated unions, 1897-1945.** SOURCES: For 1897-1928, see Wolman, Leo, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936, pp. 138-139; for 1929-1934, see Wolman, adjusted to include membership of unions in the Trade Union Unity League shown on p. 144; for 1935-1945, Bureau of Labor Statistics' estimates based upon fragmentary data. See general note for series D 218-223.

### WORK STOPPAGES (D 224-238)

**D 224-238. Work stoppages, workers involved, man-days idle, major issues, and average duration, 1881-1945.** SOURCES: For 1881-1936, see Bureau of Labor Statistics, *Strikes in the United States, 1880-1936*, Bulletin No. 651; for 1937-1945, see May issues of *Monthly Labor Review*, 1938-1947.

The statistical series on work stoppages caused by labor-management disputes dates back to 1881 with a gap for the 8-year period 1906-1913 during which no data were collected. Fragmentary data for earlier years, going back as far as 1741, were brought together and published in the *Third Annual Report of the Commissioner of Labor, 1887*, pp. 1107-8.

The *Third Annual Report, 1887*, covers the period 1881-1886 (with fragmentary data for earlier years); the *Tenth Annual Report, 1894*, covers the years 1887-1894; the *Sixteenth Annual Report, 1901*, the period 1895-1900; and the *Twenty-first Annual Report, 1906*, the period 1901-1905. No national statistics on work stoppages were compiled for the years 1906-1913. Beginning with 1914 the data have been compiled by the Bureau of Labor Statistics.

In recent years the Bureau has used the term "work stoppages caused by labor-management disputes." Use of this term, however, has not represented any departure in coverage of the historical and more popular terminology of "strikes and lock-outs." The Bureau's definitions of these terms are as follows: A *strike* is a temporary stoppage of work by a group of employees in order to express a grievance or to enforce a demand. A *lock-out* is a temporary withholding of work from a group of employees by an employer (or group of employers) in order to coerce them into accepting the employer's terms.

While the above definitions were first used in the middle 1930's, the substance of the definitions has been used as a guide throughout the period covered by the series. The individual strike or lock-out, that is, *one concerted action*, is the unit counted irrespective of the number of unions or employers jointly involved in the controversy.

The figures on number of workers involved and number of man-days idle include data for all workers made idle in the establishments where the strike or lock-out occurred. The data do not measure indirect or secondary idleness in other establishments which suspend or curtail operations due to material or service shortages resulting from a work stoppage.

Stoppages involving fewer than 6 workers or lasting less than a full shift are excluded from the series. Such minor disputes usually have little appreciable effect on production, and the difficulties of obtaining adequate data make their inclusion in a statistical series impracticable.

For the period 1881-1905 the Bureau of Labor periodically examined the files of leading daily newspapers, trade magazines, and commercial periodicals to locate references to strikes and lock-outs. Agents of the Bureau were then assigned to collect basic data

from the parties directly involved and were instructed to inquire widely for all strikes and lock-outs not discovered through the press. For 1906-1913 no statistics on work stoppages were gathered. During 1914 and 1915 very little information was collected except for noting the number of stoppages. For 1916-1926 a rather complete count of the number of stoppages was made from press notices, but limited returns from questionnaires sent out resulted in incomplete data, with the number of workers involved reported for only about two-thirds of the stoppages. Since 1927, methods of collecting basic data through use of a mail schedule have been improved and coverage has been virtually complete.

Initial notices or leads are obtained from the press and from various Federal and State agencies dealing with labor-management disputes. At the present time (1947) the Bureau of Labor Statistics has access to newspaper clippings on strikes from over 250 daily newspapers and from many union and industry journals, and obtains data from the Conciliation Service of the U. S. Department of Labor and from several State labor agencies.

Preliminary estimates of stoppages, workers involved, and man-days idle are published monthly. A detailed statistical analysis is issued annually in the *Monthly Labor Review*, and subsequently, in greater detail, as a separate bulletin.

Series D 1-10.—LABOR FORCE—PERSONS 10 YEARS OLD AND OVER GAINFULLY OCCUPIED, IN AGRICULTURAL AND IN NONAGRICULTURAL PURSUITS; AND TOTAL AND MARRIED WOMEN IN THE LABOR FORCE OR GAINFULLY OCCUPIED, 15 YEARS OLD AND OVER: 1820 TO 1940

[Figures for 1940 relate to the labor force; those for earlier years relate to gainful workers. For differences in concepts and statements of adjustments, see text statement, series D 1-7]

YEAR	ALL PERSONS 10 YEARS OLD AND OVER								WOMEN IN LABOR FORCE OR GAINFULLY OCCUPIED, 15 YEARS OLD AND OVER <sup>1</sup>

1830	<sup>5</sup> 8,639,412	3,931,537	45.5	1,159,084	2,772,453	100.0	29.5	70.5			
1820	<sup>6</sup> 6,487,815	2,881,000	44.4	812,042	2,068,958	100.0	28.2	71.8			

<sup>1</sup> Figures for 1940 are revised estimates of labor force 14 years old and over; see Bureau of the Census, *Current Population Reports*, Series P-50, No. 2. Figures for prior years are for gainfully occupied 15 years old and over.

<sup>2</sup> See text for explanation of derivation of this figure.

<sup>3</sup> Excludes persons in Indian Territory and on Indian reservations, areas specially enumerated at that census, but for which areas no occupation statistics are

available. Figures for the remaining area are the corrected figures; for explanation, see analysis of occupation returns for 1890 in *Twelfth Census (1900) Special Reports*, "Occupations," pp. lxvi-lxxiii.

<sup>4</sup> Final figures, after reenumeration of Montgomery County, Maryland, in 1841.

<sup>5</sup> Includes 9,419 out of 11,130 persons for whom age was not ascertained.

<sup>6</sup> See U.S. Bureau of the Census, *Supplementary Analysis of Twelfth Census*, p. 408.

Series D 11-31.—LABOR FORCE—TOTAL IN LABOR FORCE AND EMPLOYMENT STATUS: 1940 TO 1945

[In thousands of persons 14 years old and over. Excludes institutional population. Figures are revised. See Bureau of the Census, *Current Population Reports*, Series P-50, No. 2]

AVERAGE FOR THE YEAR	TOTAL LABOR FORCE (INCLUDING ARMED FORCES)			CIVILIAN LABOR FORCE					
	Both sexes	Male	Female	Total civilian labor force			Total employed		
				Both sexes	Male	Female	Both sexes	Male	Female
1945	65,140	45,870	19,270	53,860	34,830	19,030	52,820	34,210	18,610
1944	65,890	46,520	19,370	54,630	35,460	19,170	53,960	35,110	18,850

<sup>1</sup> Estimates beginning in 1930 are for midyear rather than annual average. Because of this, from 1930 on, employment plus unemployment, shown in series D 64, D 65 will not exactly equal the number of gainful workers shown in series D 62.

<sup>2</sup> Unemployment is derived as the difference between the employment estimate and the estimated labor force or total number of gainful workers shown in series D 62. Negative unemployment in the estimates shown in this table arises during periods of high industrial activity when the number of persons actually employed is in excess of the projected estimate of the labor force or total number of gainful workers.

<sup>3</sup> Data for 1900 to 1929 not directly comparable with series for later years.

<sup>4</sup> This figure and those of subsequent years are based on the 1940 Census labor-force concept and therefore are not comparable with those for prior years which are based on the gainful-worker concept. The 1940 figure based on the gainful-worker concept is 54,308,000. Figures for years prior to 1940 are all based on the gainful-worker concept. (See text for series D 1-7 for discussion of these concepts.)

Series D 77-89.—LABOR FORCE—SOCIAL-ECONOMIC GROUP OF THE EXPERIENCED LABOR FORCE, 1940, AND GAINFUL WORKERS, 1910 TO 1930

[For persons 14 years old and over]

YEAR	Total	Profes-sional persons	PROPRIETORS, MANAGERS, AND OFFICIALS					UNSKILLED WORKERS					
			Total	Farmers (owners and tenants)	Wholesale and retail dealers	Other proprie-tors, managers, and officials	Clerks and kindred workers	Skilled workers and foremen	Semi-skilled workers	Total	Farm laborers	Laborers, except farm	Servant classes

<sup>1</sup> The average of those on the pay rolls during the month. Computed by multiplying average weekly hours by average hourly earnings.

<sup>2</sup> Total man-hours paid for, reduced to a weekly basis (7/365, 7/366, 7/31, 7/30, 7/28, or 7/29), divided by the number of employees on the pay rolls during the month. For the years before 1933, the full month count was computed by ratio adjustment of the middle-of-the-month count (a virtually constant ratio after 1932).

<sup>3</sup> Total pay rolls divided by total man-hours paid for.

<sup>4</sup> Railroads include Class I switching and terminal companies. The Interstate Commerce Commission published detailed data for the various groups of employees up to 1927 only for Class I railroads including switching and terminal companies and thereafter only for these roads excluding switching and terminal companies. The exclusion of these companies makes virtually no difference in the averages for the industry as a whole.

<sup>1</sup> Woolen and worsted goods manufacturing includes Southern mills. Data for previous years exclude Southern mills; their relative importance in the industry was small, especially in the earlier part of the period.<sup>2</sup> For hosiery and underwear industries in the years 1910-1913 and 1919, "selected occupations" only were included; in 1914, the averages for the "selected occupations" did not differ significantly from the averages for "all occupations."

<sup>1</sup> "Employed wage earners" includes all workers except those in occupations and professions in which strikes rarely if ever occur.

<sup>2</sup> Estimated working time computed by multiplying the average number of "employed wage earners" each year by the days worked by most employees during the year.

<sup>3</sup> Figures are based on stoppages beginning each year prior to 1927; for 1927 and subsequent years, stoppages ending in each calendar year.

<sup>4</sup> Wages and hours were important issues in many of these stoppages also.

<sup>5</sup> The number of workers involved in some strikes which occurred from 1916 to 1926 is not known. However, the missing information is for the smaller disputes, and it is believed that the totals given above are fairly accurate. Numbers of stoppages to which workers' data relate are as follows: 1916, 2,667; 1917, 2,325; 1918, 2,151; 1919, 2,665; 1920, 2,226; 1921, 1,785; 1922, 899; 1923, 1,199; 1924, 898; 1925, 1,012; 1926, 783.

## Chapter E. Agriculture (Series E 1-269)

### General Statistics: Series E 1-116

**E 1-269. General note.** In this chapter, series E 1-60 relate to farm real estate, farms and tenure; series E 61-71 provide data on farm employment, wages, and productivity; series E 72-75 present a few production measures; series E 76-104 are concerned with farm taxes, insurance and income; series E 105-116 constitute data on farm machinery and equipment, and fertilizer consumption; series E 117-180 show statistics on livestock, meat, dairying, and poultry; series E 181-243 relate to crop statistics; and series E 244-269 provide summary series on farm credit.

Basic statistics on agriculture are, for the most part, prepared by the Bureau of the Census, Department of Commerce, which conducts the Census of Agriculture, and by the Department of Agriculture which prepares current estimates.

Annual agricultural statistics of a wide variety have been issued currently by the United States Department of Agriculture for over 80 years—the first being as of May 1, 1863. Statistics compiled by the Bureau of Agricultural Economics on crops, livestock and livestock products, agricultural prices, farm employment, and other related subjects are based mainly on data obtained through mail questionnaires. The basic information is obtained from nearly three-quarters of a million reporters, located in every agricultural county in the United States, who report on one or more items during a year. These reporters, mostly farmers, report for their own and nearby farms on some 80 crops and scores of other items pertaining to agricultural production and farm-family living.

Beginning with 1840 a Census of Agriculture has been taken every 10 years in conjunction with the Decennial Census of Population. In 1925, 1935, and 1945 a mid-decennial Census of Agriculture has also been taken. Information at each census has been obtained by a personal canvass of individual farms by census enumerators. The first Census of Agriculture, that of 1840, was limited in scope. It included such items as an inventory of the principal classes of domestic animals, the production of wool, the value of poultry, the value of products of the dairy, and the production of the principal crops. The number of farms and the acreage and value of farm land were first included in the Census of 1850. In 1880 information was first secured as to the tenure under which the farms were operated. A detailed classification of farm land according to use was first obtained in 1925; in earlier censuses, farm land was classified only as improved land, woodland, and other unimproved land. For brief discussions of the comparability of various agricultural data, census to census, see United States Bureau of the Census, 1945, *Census of Agriculture Reports*, vol. II.

For each decade from 1840 through 1900, the Census of Agriculture was taken as of June 1. The four decennial censuses since then have been taken as of April 15, 1910; January 1, 1920; April 1, 1930; and April 1, 1940. The 1925, 1935, and 1945 quinquennial Censuses of Agriculture were taken as of January 1.

#### FARM REAL ESTATE, FARMS, AND TENURE (E 1-60)

**E 1-4. Number and value of farms, decennial 1850-1900; annual 1910-1945.** SOURCE: For 1850-1900, data from Bureau of the Census reports; for 1910-1945, see Bureau of Agricultural Economics, *Net Farm Income and Parity Report: 1943*, July 1944 (processed); and *The Farm Income Situation*, June-July 1947 (processed).

The first Census of Agriculture was taken in 1840, but the Census of 1850 was the first in which data on the number, acreage, and value of farms was secured. Prior to 1850, early tax records are available in some counties giving the number, acreage, and

value of farms listed for assessment purposes. Information on farm land values in scattered local areas is referred to by Bidwell, P. W., and Falconer, J. I., *History of Agriculture in the Northern United States, 1620 to 1860*, pp. 70-71, 242 and 328. Similar information for Southern States is found in Gray, L. C., *History of Agriculture in the Southern United States to 1860*, vol. I, pp. 403-406, and vol. II, pp. 640-645.

**Definitions.**—Instructions accompanying the 1945 Census schedule gave the following definition for farms to be enumerated:

A farm, for census purposes, is all the land on which some agricultural operations are performed by one person, either by his own labor alone or with the assistance of members of his household, or hired employees. The land operated by a partnership is likewise considered a farm. A "farm" may consist of a single tract of land, or a number of separate tracts, and the several tracts of land may be held under different tenures, as when one tract is owned by the farmer and another tract is rented by him. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a farm. Thus, on a plantation the land operated by each cropper, renter, or tenant should be reported as a separate farm, and the land operated by the owner or manager by means of wage hands should likewise be reported as a separate farm. \* \* \* Do not report as a farm any tract of land of less than 3 acres, unless its agricultural products in 1944 were valued at \$250 or more. \* \* \* (See 1945 Census of Agriculture Reports, vol. II, p. 371ff.)

The 1945 Census of Agriculture Report (vol. II, pp. 4-5) carried the following statement of explanation regarding the census data on number of farms:

The definition of a farm used in the 1945 Census of Agriculture was essentially the same as that used in the 1940, 1935, 1930, and 1925 censuses. That used for the 1920 and 1910 censuses was similarly worded but was somewhat more inclusive. In those years farms of less than 3 acres with less than \$250 worth of products were to be included, provided they required the continuous services of at least one person.

In the definition for 1900, there was no acreage limit. Market, truck, and fruit gardens, orchards, nurseries, cranberry marshes, green houses, and city dairies were to be included, provided the entire time of at least one individual was devoted to their care. For 1890, 1880, and 1870, no tract of less than 3 acres was to be reported as a farm unless \$500 worth of produce was actually sold from it during the year. For 1860, no definition was given the enumerators. In the Census of 1850, there was no acreage qualification given in the definition, but there was a lower limit of \$100 for value of produce.

The value of farm real estate and other specified items of farm property obtained by the census was the current market value.

Data for the census years are published in Bureau of Census reports, and are obtained from complete census enumerations. The number of farms between census years is estimated by the Bureau of Agricultural Economics on the basis of estimates of changes in farm population. The value of farm land and buildings between census years is estimated on basis of changes in the Bureau of Agricultural Economics index of land values per acre and adjusted for changes of acreage of land in farms.

**E 5. Index of estimated value of farms per acre, 1912-1945.** Base: 1912-14 = 100. SOURCE: Department of Agriculture, *The Farm Real Estate Situation*, circular No. 754, and earlier circulars bearing the same title.

These index numbers cover farm land, together with buildings and other permanent improvements. Estimates of average value per acre of farm real estate, within relatively small communities, are made by crop reporters of the United States Department of Agriculture on March 1 of each year. They are not averages of market

transactions or sales prices, although it is thought that such transactions as do occur tend to influence the reporters in formulating their estimate for the community.

About 20,000 estimates of average value per acre are obtained from the crop reporters. In addition, approximately 9,000 reports from a special list of reporters (farm real estate dealers, country bankers, and appraisers) are used as a check. Data from both sources are summarized for crop reporting district averages and are combined into State, regional, and national weighted averages. The weights used are fixed on the basis of area of land in farms according to the 1925 Census of Agriculture. Index numbers of the State, geographic division, and United States estimates are then computed, using as a base 1912-1914=100.

**E 6-11. Estimated number of farms changing ownership per 1,000 farms, 1926-1945.** SOURCE: Department of Agriculture, annual circular, *The Farm Real Estate Situation*.

Basic data for these estimates are supplied by crop reporters. *Farms* are defined broadly as properties used primarily for farming and exclude ranches, plantations, and orchards. The reporters are instructed that if ownership of a farm has changed more than once in the last 12 months, then each transfer should be counted separately. *Voluntary sales and trades* (series E 7) indicates *bona fide* sales, *straight* sales, etc.; contracts to purchase are included, but not options. *Forced sales* (series E 8-10) are divided between those resulting from difficulties in meeting payments on indebtedness and those resulting from delinquency in payment of taxes. *Foreclosures of mortgages, bankruptcies, etc.*, (series E 9) includes loss of title by default of contract, sales to avoid foreclosure, and surrender of title or other transfers to avoid foreclosure. *Other transfers* (series E 11) includes transfers of title as a result of inheritance and gift, administrator and executor sales in settlement of estates, and a small group of miscellaneous and unclassified sales.

The data refer to the number of transfers that occurred during the 12 months ended March 15. The reports are summarized by crop reporting districts and are combined to yield State ratios, using the number of farms reported in the 1925 Census as a basis for the weights, except in the Southern States where the weights are based on the number of farms minus the number of croppers.

A processed release by the Bureau of Agricultural Economics, "Transfers of Farm Real Estate," August 1939, gave data on transfers for 485 selected counties, for 1935 or earlier years. In a number of counties, data on recorded transfers are shown in that report for a period of years extending back to 1900.

The county record data on transfers have been used as a basis for extending back to 1912 the regular series of estimates of frequency of voluntary sales, and foreclosures and assignments, for the United States as a whole (see series E 17-18). The county record data for earlier years were in terms of tracts and acreages, rather than farms, and by calendar years; hence they were not exactly comparable with the regularly computed series. The total acreage was used in preference to the number of parcels in extending back the transfer volume series. For the period since 1926, transfer data for the 12 months ended March 15 were used to represent the previous calendar year's transfers. The estimates for the earlier years are shown in series E 17 and 18.

**E 12-16. Percentage of voluntary sales and trade by specified classes of residents, 1928-1945.** SOURCE: Department of Agriculture, annual circular, *The Farm Real Estate Situation*.

Data on the character of farm buying are computed annually from reports of individually listed actual sales furnished by co-operating farm real estate dealers and similar correspondents. For the purpose of this classification a *local resident* (series E 12) was defined as one "from the same county, or a county adjoining that in which the farm bought is located." Purpose of purchase (series E 13) was determined from "Yes" or "No" answers to the question: "As far as you know, did the buyer buy to actually work the place himself or to turn it over to some of his children to own or operate?" Occupation status of buyer (series E 14-16) was deter-

mined on the basis of answers to the question: "At the time he bought was the buyer (1) an active farmer, or (2) a retired farmer, or (3) mainly in some other occupation?"

The percentage distributions are based on simple totals of all reports received. The distributions indicated for the United States as a whole have checked closely with those obtained in selected county surveys during recent years. The data published in *The Farm Real Estate Situation* also give comparable classifications by geographic divisions.

**E 17-18. Transfers per 1,000 farms, 1912-1924.** SOURCE: See text of series E 6-11.

**E 19-60. General note. Farm tenure, census years, 1880-1945.** SOURCE: For 1880-1940, see Bureau of the Census, Sixteenth Census of the United States, *Agriculture*, vol. III. Data for 1945 are from Bureau of the Census records.

Before the Census of 1880 no general study of operator status had been conducted in this country, although it had been the national policy from the first to be liberal with the public lands in the encouragement of owner operatorship of farms. Studies in the history of agriculture prior to 1860 contain chapters on land tenure but these, necessarily, are based upon fragments of information on the tenure situation. See Bidwell, P. W., and Falconer, J. I., *History of Agriculture in the Northern United States, 1620-1860*, and Gray, L. C., *History of Agriculture in the Southern United States to 1860*.

The 1900 Census of Agriculture reported the results of a study of the ownership of rented farms in the United States. This report had particular reference to the questions of absentee ownership and the concentration of ownership of rented farms. On a sample basis, the Bureau of Agricultural Economics of the Department of Agriculture has made subsequent studies of the ownership of rented farms as of 1920 and 1945. The results of the 1920 study were published in 1926 as Department of Agriculture *Bulletins 1432* and *1433*, and the results of the 1945 study are now being tabulated.

The findings of a census of plantations for 1910 were published in 1916 by the Bureau of the Census under the title *Plantations in the South*. This report covered 325 selected counties in 11 Southern States. In the selected plantation area, 39,073 plantations were reported as using 5 or more tenants. In connection with the 1940 census, the Bureau made another study of plantations but has not published the results. The findings, in connection with the 1945 Census of Agriculture inquiries into the so-called multiple farm units, were published in 1947 by the Bureau of the Census under the title *Multiple Unit Operations*. The Bureau of Agricultural Economics of the Department of Agriculture issued in 1924 as Department Bulletin 1269 the results of a study made by C. O. Brannen into the *Relation of Land Tenure to Plantation Organization*.

For the Census of 1880 and that of 1890 only the number of farms was classified by tenure. Classifications by color of the farm operator and interclassifications by color and tenure were first made in the Census of 1900.

*Definitions of terms* (series E 19-60).—A *farm operator*, according to the census definition, is a person who operates a farm, either performing the labor himself or directly supervising it. The census definition of a farm is on the basis of operating units, rather than ownership tracts. A *farm* may consist of a number of separate tracts and these may be held under different tenures, as when one tract is owned and another tract is rented by the farm operator. Similarly, when a landowner has several tenants, renters, or croppers, the land operated by each is considered a separate farm. Therefore, the number of farm operators, for all practical purposes is identical with the number of farms (series E 19) and these items are used interchangeably.

The color classification of farm operators includes the Mexicans with the whites. The nonwhite group (series E 45, E 54-60) in-

cludes Negroes, Indians, Chinese, Japanese, and other nonwhite races.

Each farm was classified according to the tenure under which the operator controlled the land, on the basis of replies to the following three inquiries on the schedule: Item 9. Do you operate this farm for others as hired manager? (Yes or no); Item 10. How many acres in this farm do you own?; Item 11. How many acres in this farm do you rent from others?

The enumerator was instructed to consider as owned, land which the operator or his wife held under title, homestead law, purchase contract, or as one of the heirs or as trustee of an undivided estate. If both an owned and a rented tract were farmed by the same operator, these were to be considered as one farm even though the tracts were not contiguous and each was locally called a farm. Farm operators were classified into four major tenure groups: (1) *Full owners* (series E 20, E 32, E 38, E 49, E 56) who own all the land they operate; (2) *Part owners* (series E 21, E 33, E 39, E 50, E 57) who own a part and rent from others the rest of the land they operate; (3) *Managers* (series E 22, E 34, E 40, E 51, E 58) who operate farms for others and receive wages or salaries for their services. Persons acting merely as caretakers or hired laborers were not classed as managers. Farms operated for institutions or corporations were considered to be managed even where no person was specifically indicated as being employed as the farm manager; (4) *Tenants* (series E 23, E 35, E 41, E 52, E 59) operate hired or rented land only. *Croppers* (series E 36, E 42, E 53, E 60) have been defined by the 1945 Census as share tenants to whom their landlords furnish all of the work animals, or tractor power in lieu of work animals. Croppers were classified separately for the first time in the 1920 Census and data for this class have been secured at each succeeding census.

In the censuses of 1920, 1925, and 1930 croppers were defined as share tenants whose landlords furnished the work animals. For the census of 1935, the schedule carried no inquiry in regard to the method of paying rent and, therefore, croppers for that year included all tenants whose landlords furnished the work animals. The furnishing of tractor power was not taken into account in classifying croppers until the census of 1940.

The greatest difficulties in making a classification by tenure result from the sharecropper system. Briefly, the question involved is whether the sharecropper should be considered merely a type of laborer or a farm operator. In reality, croppers have some of the characteristics of both laborers and tenants. *Crop-sharing contracts*, by John H. Graves, Bureau of the Census, 1943, is a memorandum regarding legal relations and rights of parties when land owned by one is cultivated by the other under agreement to share the crops. The memorandum covers 14 Southern States. Speaking of the situation as of 1940 the author of the memorandum finds "if croppers were included with landowners as a single farm, it would make a difference [reduction] for the United States of about 567,675 in the number of farms . . . and for the South a difference [reduction] of 541,291 in the number of farms . . ."

#### FARM EMPLOYMENT, WAGES, PRODUCTIVITY (E 61-71)

**E 61-63. Farm employment, 1909-1945.** SOURCE: Bureau of Agricultural Economics. For 1909-1942, see *Farm Wage Rates, Farm Employment, and Related Data*, January 1943, p. 155 (processed); for 1942-1945, see *Agricultural Statistics*, 1946, p. 533.

Current farm employment data are collected by the crop-reporting service operated by the United States Department of Agriculture. About 70,000 crop reporters are on a list of general crop and livestock farmers who are sent questionnaires on farm employment and wages paid hired farm workers. From these reporters, about 20,000 returns are received each month.

Crop reporters are asked to report the number of persons employed 2 or more days on their farms in the last week, excluding persons doing housework. The reporting period from 1935 to 1941

was designated as 7 days prior to the first of the month. Since 1941, the respondent has been asked for the number of persons employed during the past week, which varies according to the day the crop reporter receives the questionnaire. Before 1935, the time period was not designated. *Family workers* include operators and members of their families who worked on the farm without pay. *Hired farm workers* include all persons paid wages for farm work on the reporter's farm, whether paid monthly, daily, piece, or other type of wage rate.

The average number of hired and family workers per farm for States are computed for the reporting farms. The averages are then adjusted by factors which are based on extrapolations from the last census level, labor requirements data, and the estimated seasonal pattern of employment based on the 1940 Census and studies in selected States. The adjusted averages are then multiplied by the estimated number of full-time farms in each State to obtain the estimates of the number of family and hired workers employed. Full-time farms are defined as those on which the operator worked less than 250 days at off-farm work during the year. Data from the Census, State assessors' reports, and Agricultural Adjustment Administration records are used in estimating the number of farms. Annual averages of employment are simple averages of first-of-month employment estimates.

Collection of monthly farm-employment data through crop reporters was started in October 1923. In 1938, the National Research Project of the Works Progress Administration developed and published monthly farm-employment estimates for 1925-1936, from the crop reporter data. See Shaw, E. E., and Hopkins, J. A., *Trends in Employment in Agriculture, 1909-36*, Works Progress Administration, National Research Project, Report No. A-8, Philadelphia, Pennsylvania, November 1938. Current monthly estimates have been made by the Bureau of Agricultural Economics from crop reporter data from 1939 to the present time, using the methods developed in the Works Progress Administration project. The series was adjusted to the 1940 census bench mark data and monthly estimates were made for January 1937 to 1939. Thus, monthly data are available for the United States and nine geographic divisions from 1925 to the present time. Estimates of annual average employment and monthly employment by 10 type-of-farming areas are also available from 1925 to the present. Unpublished State estimates are used as weights in computing wage rate estimates from crop-reporter data.

In the National Research Project study annual estimates of farm employment from 1909 to 1924 were also published. These estimates were based on census data and on data such as acreage and farm production and farm population changes.

In addition to the farm-employment estimates, monthly indexes of farm employment are available, both unadjusted and adjusted for seasonal variation. The adjustment factors for seasonality are revised each year. The employment index is based on the 1910-14 period; the base is a simple average of the five annual figures.

**E 64-68. Farm wage rates, 1866-1945.** SOURCE: Bureau of Agricultural Economics. For 1866-1941, see *Farm Wage Rates, Farm Employment, and Related Data*, January 1943, pp. 3-4 (processed); for 1942-1945, see *Agricultural Statistics*, 1946, p. 538.

Information on farm wages prior to 1866 is scattered, and is on a State basis or consists of individual records rather than data for the country as a whole. For farm wage data before 1866, see *Wages of Farm Labor in the United States*, Department of Agriculture, Bureau of Statistics, Miscellaneous Series, Report No. 4, Washington, D. C., 1892; Holmes, George K., *Wages of Farm Labor*, Department of Agriculture, Bureau of Statistics, Bulletin 99, Washington, D. C., 1912; and Adams, T. M., *Prices Paid by Vermont Farmers for Goods and Services and Received by Them for Farm Products, 1790-1940*; see also Vermont Agricultural Experiment Station Bulletin 507, *Wages of Vermont Farm Labor, 1780-1940*, Burlington, Vermont, February 1944.

The first investigations made by the Department of Agriculture of the wage rates farmers paid hired workers in the United States was in 1866. It was followed by 18 similar studies made at irregular intervals in the following 44 years. Then from 1909 to 1923, inquiries were made annually. Since 1923, they have been on a quarterly basis. In all these surveys, questionnaires were sent to the voluntary crop correspondents. Information was requested on the average monthly and daily wage rates, with and without board, paid by farmers in the locality.

From 1866 to 1909 an estimate of the average wages in the locality for the year was requested of the crop reporters. During this period, the time of year when the inquiry was made varied considerably; sometimes it was in the spring, sometimes in the fall or winter. For those years in which the investigation was made in the spring, there is some uncertainty as to which year the annual average refers. For this reason, a dual-date is designated in the series as, for example, "1874 or 1875." In each of these 19 investigations, wage rates per day were obtained separately for harvest work and for work other than harvest work. The data published here for these years are the day rates for "other than harvest work." The monthly wage rates reported are not strictly comparable throughout this period. From 1866 to 1890, monthly wage rates were reported for workers hired by the year. These are the rates shown here. In addition, in the first three of these inquiries, crop reporters were asked for monthly rates paid to workers hired for the season, which are published in Holmes (see above). From 1891 to 1909, the monthly rate requested was on a combined annual and seasonal basis. In 1909, the distinction was again made, but the two types of monthly rates were averaged. The weighted average (revised) is published here. For the original averages of the monthly rates for workers hired by the year and those hired by the season, see Holmes, *Wages of Farm Labor*, referred to above. Throughout this period from 1866 to 1909, wage rates requested were those paid to men doing outdoor work. In 1902, 1906, and 1909, rates paid women for domestic work on farms were also requested.

Data from the 19 wage inquiries were published in four bulletins by the Bureau of Statistics of the Department of Agriculture—No. 4, 22, and 26 of the miscellaneous series, which were published in 1892, 1901, and 1903; and *Bulletin 99* of the Bureau of Statistics series published in 1912. In the first three of the bulletins the rates were published without reducing currency to gold values, since the monetary system of this country was not on a gold basis, but in Holmes' bulletin (No. 99) and in subsequent reports the wage rates for the period of inflated currency values during and following the Civil War were reduced to gold values. In Holmes' bulletin the weighting system, which was not uniform for all previous surveys, was revised and wage-rate data for all 19 surveys were recomputed. The number of male agricultural laborers, as reported by census of occupations, in each State was used as the weight in obtaining United States and major region averages from State average wage rates.

From 1909 to 1923, annual inquiries as to farm wage rates in their localities were made of crop reporters. As previously, they were asked about monthly rates with and without board; and about daily rates, with and without board, "at harvest" and for "other than harvest labor." In 1923, to give an overlap for linking purposes, a quarterly inquiry was initiated as well as the annual survey. The new quarterly series changed the time reference of day rates to "average wage rates being paid to hired labor at the present time in your locality," with an additional instruction to include in the estimates of day rates "average daily earnings of piece workers." Thus the distinction between day rates for harvest work and for non-harvest work was no longer made. For comparative purposes, the daily wage rates "for other than harvest work" in the period before 1923 are probably more comparable with the rates obtained after the 1923 shift in definition of daily rates than

are the daily rates for harvest work or a combination of the two types of daily rates obtained before 1923.

From 1923 to the present time, the questions asked crop reporters on wage rates have continued in almost exactly the same form. A more detailed discussion of the method of collecting wage rate data through crop reporter questionnaires is given in Hale, R. F., and Gastineau, R. L., *Reliability and Adequacy of Farm Wage Rate Data*, Department of Agriculture, Agricultural Marketing Service, Washington, D. C., February 1940 (processed).

Because the return of these questionnaires is on a voluntary basis and because the crop reporter list is made up of those willing to cooperate, the group of farmers reporting on wage rates in their locality is not representative of all farmers or all farming communities. Most of the returns are from operators of general crop and livestock farms. It is doubtful whether rates on specialized farms are adequately covered. The rates reported probably provide a fairly accurate picture of average rates paid regular hired men in the general crop-producing regions.

Average rates based on data reported by crop reporters have been published quarterly in the Bureau of Agricultural Economics' *Farm Labor* and annually in the Department of Agriculture's *Agricultural Statistics*. Both quarterly rates and annual average rates are published for States, nine major geographic divisions, and the United States. The annual average rates are weighted averages of the quarterly averages, using data on the number of hired farm workers employed each quarter as the weight. The number of hired farm workers employed is also used to weight State averages to geographic divisions and United States averages. Up to 1938, census data on the number of male hired workers were used as weights. In 1938 the weighting system was revised and average rates for the United States and the geographic divisions for 1909-1938 were also revised. State rates were unchanged. These new rates were based on data compiled by the Works Progress Administration and published in Shaw, E. E., and Hopkins, J. A., *Trends in Employment in Agriculture, 1909-36*, Works Progress Administration, Natl. Res. Proj. Rpt. No. A-8, Philadelphia, November 1938. Since 1938, the current employment estimates have been used. A more detailed statement on the current weighting system is given in Hale, R. F., and Gastineau, R. L., (see above), and in *Farm Wage Rates, Employment, and Related Data* (also cited above).

Index numbers of the composite farm wage rates (series E 64) are published for geographic regions and for the United States. In obtaining this index, the day rates are multiplied by 20 to obtain their monthly equivalents. A constant set of percentages of the workers receiving each type of rate, based on a 1927 survey, have been used in weighting rates in each geographic region beginning 1925. The resulting composite wage rate is converted to an index based on the period 1910-1914. The base is a simple average of the five annual figures. The quarterly wage-rate index, which is also available, is published both unadjusted and adjusted to remove seasonal variation. Seasonal adjustment factors are based on the relationship of monthly levels to annual averages for 1923 to 1939.

In the absence of direct information in the past, the difference between the average monthly rate with board and the average monthly rate without board, as reported by crop reporters, has often been estimated as the monthly value of *board* which has never been explicitly defined. The value thus obtained by subtraction of the two series for July 1945, however, is considerably lower than the average value of room and meals furnished as perquisites which was reported by the farmer for a similar period. A more detailed discussion of the value of perquisites furnished by farmers is given in "Perquisites Furnished Hired Farm Workers, United States and Major Regions, 1945," Bureau of Agricultural Economics Report No. 18 of the series *Surveys of Wages and Wage Rates in Agriculture*, December 1946 (processed).

**E 69. Farmers' expenditures for hired labor, 1909-1945.** SOURCE: Bureau of Agricultural Economics. For 1909-1929, see *Income Parity for Agriculture*, part II, sec. 1, "The Cost of Hired Farm Labor, 1909-38," April 1939, p. 5; for 1930-1945, see *Agricultural Statistics*, 1946, p. 564. Data for census years are from Bureau of the Census; intercensal years are BAE estimates. Current estimates are published in Bureau of Agricultural Economics, *Farm Income Situation*, for June and July of each year. For a detailed statement of the methods used in estimating the farm labor bill, see "The Cost of Hired Farm Labor, 1909-38," cited above; and "Net Income and Production Expenses of Farm Operators by States, Calendar Years 1929, 1939-44," part VI, sec. 2 of the series *Income Parity for Agriculture*, October 1945.

Annual estimates of farmers' total expenditures for hired labor since 1909 are available for the United States; and for 1929 and annually, beginning in 1939, for individual States. The total farm labor bill is divided between cash wages and the value of perquisites farmers furnished hired workers. It is also divided between the wage bill paid to workers living on farms and those not living on farms.

The annual estimates of the cash expenditures for hired labor for census years were taken from the Census of Agriculture. Estimates for intercensal years were interpolated on the basis of changes in the product of hired farm employment and average wage rates, with the latter appropriately weighted by quarters for each type of employment.

The estimates of board and lodging furnished hired farm workers as perquisites for the United States as a whole were based on totals from the 1910 and 1920 Censuses of Agriculture. Estimates for intervening and subsequent years were based on the percentage change in the product of the number of hired farm workers paid monthly and daily wage rates with board and the value of board and lodging. This value was estimated as the difference between wage rates with board and wage rates without board, as estimated from crop reporter data. In addition, the value of perquisites other than board and lodging for 1925 was derived from a special study of the Bureau of Agricultural Economics. (Folsom, J. C., *Perquisites and Wages of Hired Farm Laborers*, Department of Agriculture, Tech. Bul. 213, 1931.) Estimates of the value of perquisites other than board and lodging for other years were based on the 1925 data and on the change in hired farm employment and changes in farm prices of the major perquisite items. And finally, the two perquisite series combined have been adjusted to the levels shown by the May 1945 survey of wages and wage rates in agriculture, made by the Bureau of Agricultural Economics. ("Perquisites Furnished Hired Farm Workers, United States and Major Regions, 1945," Bureau of Agricultural Economics, Report No. 18 of the series, *Surveys of Wages and Wage Rates in Agriculture*, December 1946.) Basic data on the number of hired farm workers living on farms and those not living on farms were from the 1930 and 1940 Censuses of Population.

The series as a whole is tied to census enumerations, which may under-estimate to some extent the total cash-wage bill. The data are comparable from year to year, and should closely approximate the variations in the total farm-labor bill.

**E 70-71. Productivity of farm labor, 1910-1945.** SOURCE: See Barton, Glen T., and Cooper, Martin R., *Farm Production in War and Peace*, Bureau of Agricultural Economics, Dec. 1945, and BAE records.

The two indexes of farm production per worker were constructed by dividing the index of production for sale and home consumption (series E 72), and the index of gross farm production (series E 73), by the index of average annual farm employment (based on series E 61).

The two series of production per farm worker have quite different long-time trends, particularly since 1918 when the number of

horses and mules on farms was at the peak. The replacement of farm horses and mules by mechanical power in the form of tractors, trucks, and automobiles had two broad effects on production per farm worker. Mechanical power and associated labor-saving equipment enabled fewer farm workers to produce more products. And, as farm horses and mules declined in number, the cropland formerly used for raising their feed was diverted to production of farm products for human use. The shift in composition of farm power thus was a force in the downward trend in farm employment and in the upward trend in farm production for the market. The result was a sharp upward trend in production for sale and home consumption per farm worker.

The trend in gross production per farm worker was not so sharply upward. This is the result of the inclusion of the value of farm-produced power as an item of gross farm production. The index of gross production per worker thus more nearly measures the change in the total production contribution of farm labor than does the index of production for sale and home consumption per worker. Part of the increase in production for sale and home consumption is attributable to the nonfarm workers who manufactured the motor vehicles and fuel for them.

Another index of agricultural production per worker was developed in Bressler, R. G., Jr., and Hopkins, J. A., *Trends in Size and Production of the Aggregate Farm Enterprise, 1909-1936*, Works Progress Administration, National Research Project, Report A-6, July 1938, and has been kept current by the Bureau of Labor Statistics. In this index of farm production the commodities are weighted by labor requirements rather than by prices in the base period as is the case for both of the indexes shown here. (See chapter D, series D 217.)

#### PRODUCTION MEASURES (E 72-75)

**E 72-73. Agricultural production indexes, 1909-1945.** SOURCE: Bureau of Agricultural Economics. Series E 72: For 1909-1944, see *Agricultural Statistics*, 1946, p. 560; for 1945, see *Farm Income Situation*, December 1947 (processed). Series E 73: For 1910-1918 and 1940-1945, data are from BAE records; for 1919-1939, see Barton, Glen T., and Martin R. Cooper, *Farm Production in War and Peace*, Bureau of Agricultural Economics, December 1945.

The volume of agricultural production for sale and farm household use (series E 72) is a fixed-weight aggregative index of production of 86 agricultural products. Because of inadequate data, some of the items that are included in the index at present are omitted in the earlier years, leaving only 41 items in 1909, the first year for which the index is available. The base period is 1935-39, and 1935-39 average prices are used as weights. This index was developed in connection with the farm-income estimates and the concepts used parallel those used in the income estimates (series E 91-94).

Group indexes are calculated for two major groups—crops, and livestock and products. Subgroups of the crops are calculated for food grains, feed crops, cotton lint and seed, oil-bearing crops, tobacco, fruits and tree nuts, truck crops, vegetable and sugar crops. The crops group includes cowpeas and hops in addition to the subgroups listed. Subgroups in livestock and products are calculated for meat animals, poultry and eggs, and dairy products. Wool and mohair are included in livestock and products group.

The data on crops are total crop-year production for sale and for farm home consumption. Data on meat animals and livestock products are total calendar-year liveweight or products sales and home consumption. Home consumption includes only farm household consumption and does not include feed and seed used on farms where grown.

The index of gross agricultural production (series E 73) for each calendar year covers total crop production, pasture consumed by livestock, and the product added in the conversion of feed and

pasture into livestock and livestock products for human use and into farm-produced power. Indexes have been constructed for each of the 9 census geographic divisions from 1919 to date and the United States from 1909 to date. Sub-indexes of gross farm production are available for product added by all livestock and by meat animal products. The total crops and pasture component has subgroups for feed grains, hay and pasture, food grains, truck crops, vegetables except truck, fruits and tree nuts, sugar crops, cotton, tobacco and oil crops. Cowpeas, hops, and hay seeds are included in the crop and pasture index. In addition, the quantity-price aggregates of farm-produced power of horses and mules are subtracted from the total quantity-price aggregates of gross farm production to obtain regional and national indexes of farm output for human use.

The decreasing importance of horses and mules as a source of farm power is reflected in the difference in the trends of the indexes of production for sale and home consumption (series E 72) and gross farm production (series E 73).

Neither of these indexes is available for years earlier than 1909. Department of Agriculture, Tech. Bulletin 703, *Gross Farm Income and Indices of Farm Production and Prices in the United States, 1869-1937*, by Strauss and Bean contains several indexes of farm production for the years 1869-1937. These indexes are not comparable with those appearing here but they probably provide the best available measure of changes in farm production prior to 1909.

**E 74-75. Aggregate acreage of 52 crops, 1909-1945.** SOURCE: For 1909-1928, data are from records of Bureau of Agricultural Economics; for 1929-1945, see BAE, *Crop Production, 1947 Annual Summary*, December 1947 (processed). Estimates of harvested acreages of principal crops in the United States appear in the records of the Crop Reporting Board of the Bureau of Agricultural Economics for the period beginning with 1866. For purposes of comparison with current totals, the estimates for 52 principal crops have been aggregated for the years since 1909.

The 52 crops selected for this treatment include the 4 feed grains—corn, oats, barley, and sorghum grain; the 4 food grains—wheat, rye, buckwheat and rice; the 5 annual legumes—dry edible beans, dry field peas, soybeans for beans, cowpeas for peas, peanuts picked and threshed; all hay; cotton, tobacco, flaxseed, potatoes, sweetpotatoes, broomcorn, sorghum silage and forage; 3 sugar crops—sugar cane for all purposes, sugar beets, and sorgo sirup; 6 field seeds—alfalfa, red clover, alsike clover, sweetclover, lespedeza, and timothy; and 21 vegetables. Of the 21 vegetables 11 are for processing and 19 for fresh market, some of which appear in both categories. Among crops not included are sweet corn for market and some of the less important commercial vegetables, most market gardens, hops, spelt, hemp, velvetbeans, minor crops, and fruits and nuts.

In aggregating these acreages it is necessary to allow for some duplications. The aggregate acreage shown for any particular year is a net acreage, excluding most duplications, excluding some annual legume acreages which may be harvested by grazing, but including small acreages of succession crops, mostly vegetables, which may be grown on the same acreage in the same year. The effect of these is more or less offsetting and the extent is probably not sufficient to affect more than the fourth significant digit.

Planted acreages of most crops have been estimated by the Crop Reporting Board only since 1929. For the same 52 crops for which harvested acreages are aggregated, a total of estimated acreages planted or grown is prepared. The difference between the aggregate of acreage planted or grown and the aggregate acreage harvested in any year represents acreage losses. These losses are published for specific crops and in total in the December issue of *Crop Production*. These series are comparable throughout, both within each series and between the two series.

The expression *acreage planted or grown* (series E 74) is descriptive of the data contained. For most crops the acreage is that

estimated as planted, and thus includes some acreage that was not harvested for various reasons. For such crops as field seeds and hay, which are harvested from fields not sown or planted annually, the term "acreage grown" is more realistic.

#### FARM TAXES, INSURANCE, AND INCOME (E 76-104)

**E 76-79. Taxes levied on farm property, 1890-1945.** SOURCE: Department of Agriculture, Bureau of Agricultural Economics, *Agricultural Finance Review* issues. These series cover all *ad valorem* taxes levied upon farm property by State and local governments. They do not cover special assessments such as those levied on a per acre or other benefit basis, by drainage, irrigation, or other special districts. *Farm real estate* (series E 76-78) is all land that falls within the Bureau of the Census definition of land in farms (see series E 1-4). *Farm personal property* (series E 79) covers all livestock, machinery, automobiles, trucks, produce, and household and personal effects. Much personal property on farms is not taxed because some States provide a flat dollar exemption or they exempt certain classes of personal property entirely.

The taxes shown include those levied upon farm property whether owned by the operator or not. To the extent that nonfarm landlords pay the taxes on farm property, the figures are greater than the taxes paid by farmers. "Levies" rather than "payments" are shown partly because data for payments are not available for many States. For short periods and in particular States, levies and payments may differ widely. Over long periods and for the country as a whole, however, levies and payments probably are about equal. The figures, therefore, can be said to represent the property-tax charges against the agricultural industry.

The several real estate tax series (E 76-78) are developed by the Bureau of Agricultural Economics from data for sample farms obtained from local tax officials or from farmers themselves, and from farm real estate tax data reported by the Agricultural Censuses of 1930 and 1940. The acreages used in computing taxes per acre are census enumerations of land in farms with interpolations for intercensal years. The values used in computing taxes per \$100 of value are based on census enumerations of operator estimates of value with interpolations for intercensal years based on the Bureau of Agricultural Economics index of farm land values. For a more detailed discussion of the method used in constructing these series, see *Farm Property Taxes and Their Relation to Parity Determinations*, issued in November 1941 by the Bureau of Agricultural Economics.

The personal property tax series (series E 79) is developed by the Bureau of Agricultural Economics from the annual figures for total real estate taxes and the ratios between the amounts of farm real and farm personal property on the tax rolls as shown in published reports of State tax commissions, boards of equalization, or similar bodies. A discussion of this series appears in the article, "Personal Property Taxation and the Farmer," in the *Agricultural Finance Review*, vol. 3, No. 2, November 1940, Bureau of Agricultural Economics.

**E 80-81. State automotive taxes paid by farmers, 1910-1945.** SOURCE: Department of Agriculture, Bureau of Agricultural Economics, *Agricultural Finance Review* issues. The series for State motor-vehicle licenses and permits (series E 80) includes payments of all registration and "tag" fees for automobiles and trucks on farms and for drivers' permits by farmers. Estimates have not been made for years prior to 1910 as the number of vehicles on farms was very small and registration charges were low. The increase in the amount paid by farmers since 1910 reflects both the increase in the number of vehicles on farms and the increase in the average charge per vehicle. The latter increase resulted partly from a long-time trend toward increasing the tax contribution of motor vehicle owners and partly from a tendency to simplify administration by adjusting license fees upward and then exempting motor vehicles from the property tax. The license and permit series is derived from

Bureau of Agricultural Economics estimates of vehicles on farms and average charges per vehicle. The latter is the average charge for all vehicles registered, adjusted to the level of charges for vehicles on farms as determined from special surveys.

State motor-fuel taxes (series E 81) are those arising out of the use of automobiles and trucks by farmers. For practical purposes they may be considered as paid by farmers, although in many States these taxes technically are levied upon the distributors or dealers. The taxation of motor fuel began in 1919 when four States adopted gallonage taxes on gasoline. By 1929 all States had such taxes. The motor-fuel series is derived from Bureau of Agricultural Economics estimates of fuel consumption of farm vehicles and the average tax rate on such fuel as developed from special surveys.

Further discussion of these series appears in an article, "Automotive Taxes and the Farmer," in the *Agricultural Finance Review*, vol. 4, No. 2, November 1941, Bureau of Agricultural Economics.

**E 82-87. Farmers' mutual fire insurance, 1914-1945. SOURCE:** Compiled by Bureau of Agricultural Economics from published State reports and from data supplied by State insurance officials, company officials, and others. The data presented here are for farmers' mutual fire insurance companies, and include insurance against fire and lightning but, in most cases, not against windstorm, hail on growing crops, or other hazards. For 1914-1933, *farmer companies* were defined as those which had more than 65 percent of their insurance on farm property. Since 1933, *farmer companies* have been defined as those which had more than 50 percent of their business on farm property. During both periods, however, all business of such companies was considered farm business, although only about 88 percent of the total insurance was on farm property. On the other hand, general-writing mutual and stock fire insurance companies also write insurance on farm property; but the business of such companies is not included, as they do not come within the definition of a *farmer company*.

The number of companies indicated (series E 82) are those for which data were obtained and may not be entirely complete for any year. The amount of surplus and reserves shown represents merely the excess of assets over liabilities. Most of the farmers' mutuals are assessment companies and as such are not required to set up unearned-premium reserves. "Cost per \$100 of insurance" (series E 84-86) does not include any amounts collected from members which have been added directly to surplus or reserve funds (series E 87). Such funds are, of course, available for payment of future losses and operating expenses. The average increase in these surplus funds during the 10-year period 1935-44 suggests that, on the average, annual assessments collected from members amounted to about 27.5 cents per \$100 of insurance, compared with amounts actually paid out for losses and operating expenses of about 24.8 cents.

**E 88-94. Cash receipts from farm marketing, and farm income, 1910-1945. SOURCE:** For 1910-1939, see Bureau of Agricultural Economics, *Net Farm Income and Parity Report, 1943, and Summary for 1910-42*, July 1944; for 1940-1945, see BAE, *The Farm Income Situation*, June-July 1947. The estimates, assembled in the last 10 years by the Bureau of Agricultural Economics, are designed primarily to meet the specifications of the legislative formula for determining income parity for agriculture; but they have also provided for the first time a systematic set of general-purpose statistics on farm income and expenditures.

As finally revised in 1938, the formula for income parity for agriculture provides in general that the net income of persons on farms from farming is at parity when it bears the same per capita relationship to nonfarm income as in the 1910-14 base period.

In 1936, the Bureau of Agricultural Economics launched an extensive project of research and estimation in the field of farm-income statistics. This project was designed to extend the estimates back to 1910 as required by the income-parity formula, to revise

the data to a full calendar-year basis comparable with similar estimates of nonagricultural income, and to improve and expand the data in other respects. Partial results were published by the Bureau, as completed, in a series of reports under the general heading of *Income Parity for Agriculture*; and all of the results in preliminary form were assembled and published in *Material Bearing on Parity Prices*, USDA, BAE, July 1941. The various series have been revised and brought up to date every year since then.

Estimates for individual States are also available for some of the more recent years. Data on cash receipts appear in *Cash Receipts from Farming, by States and Commodities, Calendar Years 1924-1944*, USDA, BAE, January 1946, and are brought up to date in the May issues of *The Farm Income Situation*. Estimates of net income appear in *Net Income and Production Expenses of Farm Operators by States, Calendar Years 1929 and 1939-44*, part VI, section 1 of *Income Parity for Agriculture*, USDA, BAE, October 1945, and are usually brought up to date in the July issues of *The Farm Income Situation*.

No adequate statistics are available on farm income and expenses before 1910. Willford I. King's early estimates of the total value produced in agriculture go back to 1850, but for census years only (*The Wealth and Income of the People of the United States*, Macmillan Co., 1915). They were based on inadequate information and are not comparable with any of the current series. With no data available for intercensal years, the decennial figures may be misleading even as an indication of the long-term trend in farm income. The decennial projections back to 1800 prepared by the National Industrial Conference Board, *National Income in the United States, 1799-1938*, 1939, are in much the same category, and must be regarded only as very rough approximations. Annual estimates of gross farm income extending back to 1869, and covering a substantial part of total farm production, are given in *Gross Farm Income and Indices of Farm Production and Prices in the United States, 1869-1937*, USDA, Tech. Bul. No. 703, December 1940. Although not comparable with any of the current series, these estimates are probably fairly reliable as an indication of trends in the gross value of farm production.

In the absence of any direct reporting of farm income on an adequate scale, it has been necessary to develop the estimates by indirect methods using the available data on production, disposition, prices, and costs. The procedure followed in the Bureau of Agricultural Economics has been to treat agriculture as though it were one tremendous enterprise, and to derive its net income by first computing "gross income," as defined below, and then deducting aggregate expenses of production.

Series E 88-91, presented here, are estimates of gross farm income and its principal components. These estimates are "gross" in the sense that they represent the total value of commodities and services produced by farms in the United States, without any deduction for costs incurred in their production, and without any consideration as to who reaps the ultimate benefit from their sale or use, whether he be a farm operator, a landlord, a farm laborer, or a bank. Cash receipts from farm marketings, in the case of crops, include all sales of crops by farmers; purchases by other farmers for use as feed or seed are later deducted as production expenses. Similarly, in the case of livestock and products, the estimates include all sales by farmers, with purchases of livestock by other farmers included as a production expense in series E 92. Farm sales of firewood and other forest products are included in the crop totals.

Series E 88 represents total cash receipts from all farm marketings, and for the period from 1933 to 1945 includes Government payments to farmers. The latter include rental and benefit, conservation, price adjustment, parity, and production payments—in short, all money paid directly to farmers by the Government in connection with its various farm programs. Indirect financial aid transmitted to farmers through commodity prices or loan values is

covered in cash receipts from marketings. Government payments to landlords are included, as well as those to farm operators; but the former are also included in series E 92 as a part of total rental payments to nonfarm landlords.

Gross farm income (series E 91) represents total cash farm income, the value of farm-produced food and fuel consumed in farm households, and an imputed rental value for all farm dwellings. Farm-household consumption of farm products is valued at prices received for the sale of similar products. It includes food and fuel furnished to hired farm laborers, later deducted as a part of total labor costs to farm operators. The rental value of dwellings is on a gross basis; later deductions of rent, interest, taxes, insurance, maintenance, and depreciation are for farms as a whole with their buildings and equipment, and include shares allocable to farm dwellings.

Gross farm income has been built up commodity by commodity from the estimates of production, disposition, price, and value of the various farm products released periodically by the Crop Reporting Board of the Department of Agriculture. These estimates in turn are generally based on periodic census enumerations supplemented by regular reports from a long list of field statisticians, farmers, and special crop, livestock, and price correspondents, and by records and reports of a wide variety of public and private agencies concerned with the inspection, storage, marketing, transportation, or processing of farm products.

The series on total farm-production expenses (series E 92) comprises the aggregate cost to farm operators, or all of that part of gross farm income which is not retained by farm operators. It includes: (1) Wages paid for hired labor, both in cash and in kind; (2) purchases of feed, livestock, fertilizer, and lime; (3) outlays for the operation of tractors, trucks, and automobiles (excluding the portion assigned to family use); and (4) a large number of other current farm operating expenses. It also includes: (5) Charges for maintenance and depreciation of farm buildings, motor vehicles, machinery and equipment; (6) taxes levied on farm property; (7) interest paid on farm-mortgage loans; and (8) net rents paid to landlords not living on farms, including that part of Government payments that goes to such landlords and not to farm operators. Other farm rents, paid to landlords who are also farm operators, are not included as they constitute offsetting items of income and cost for farm operators as a group.

The estimates of production expenses are generally based on enumerations in the quinquennial Census of Agriculture, supplemented by special surveys. Estimates for years other than census or survey years have for the most part been derived on the basis of relative changes in available series that are similar or related to the expense items in question. A combination of two series is frequently used, one representing or indicative of changes in quantity and the other of changes in price. For a few types of costs, however, the records of public or private agencies provide the basis for direct annual estimates.

The realized net income of farm operators (series E 93) is obtained by subtracting total production expenses from gross farm income. The term "realized" is used because the estimates include the value of farm products only as they are sold, with no allowance for commodities produced but not sold during the year. In other words, the estimates do not include changes during the year in farm inventories of crops and livestock. This series should not be confused with net income from agriculture, or agriculture's contribution to the total national income. The latter would include farm wages, rent, and interest in addition to inventory changes and the realized net income of farm operators.

Series E 94, the net income to persons on farms from farming, is the one used, together with corresponding estimates of the income of persons not on farms, in the legislative formula for computing income parity for agriculture. It includes: (1) The realized net income of farm operators; (2) the value, at year-end prices, of

the net change during the year in crop and livestock inventories on farms; and (3) wages, in cash or in kind, paid to farm laborers who live on farms. Inventory changes are included in order to achieve comparability with the net income of nonfarm business enterprise as ordinarily reported. Only about two-thirds of all hired farm workers live on farms; and in compliance with the residence criterion in the income-parity formula, only their wages are included in this series.

The series are constructed on a generally comparable basis throughout the period shown, and are believed to be fairly complete and reliable despite the indirect methods of estimation. A more detailed discussion of coverage and methods may be found in the various publications of the Bureau of Agricultural Economics on *Income Parity for Agriculture*.

**E 95-104. Index numbers of prices received and paid by farmers, interest and taxes, and parity ratio, 1910-1945.** SOURCE: Bureau of Agricultural Economics, records and *Crops and Markets*, April 1944, pp. 91 and 95. See also detailed listings below.

**E 95-97. Index numbers of prices received by farmers, 1910-1945.** SOURCE: Bureau of Agricultural Economics. For 1910-1943, see *Crops and Markets*, April 1944; for 1944-1945, see *Agricultural Outlook Charts, 1947*, book II, p. 12. Data on prices received and paid by farmers in their local markets are collected by the Department of Agriculture and are published as "local market prices" as distinguished from "wholesale prices" of farm products at the central markets. Three distinct types of price series are collected by the Department: (1) Annual estimates of December 1 prices of crops and January 1 farm values of livestock which constitute the oldest series, beginning in 1867; (2) mid-month prices of commodities sold by farmers, which were first collected in 1908 for crops, and in 1910 for livestock and livestock products; and (3) the prices of articles bought by farmers, beginning in 1910.

During and before the first World War, summarization of composite price movements in the Department of Agriculture was confined to some rather simple percentage comparisons and index numbers of prices received and paid by farmers. The first comprehensive index-number series of prices of farm products was constructed and published in 1921 as Department of Agriculture Bulletin No. 999, *Prices of Farm Products in the United States*. Considerable research on this subject in 1923-24 resulted in the development of the aggregative type of index-number series as first published in *Crops and Markets* in August 1924. Later revisions of the prices received index numbers have been published at 10-year intervals in 1934 and January 1944.

From the time of the first publication in 1921, the base period for index numbers of prices received by farmers has been the 60-month period, August 1909-July 1914. The primary consideration in the original decision to accept this base was that these prewar years constituted a period in which the prices of farm products were relatively stable and it was assumed that there was a more nearly normal relationship with other price series during this period than in any other period during the short term of years for which data were then available.

The series of prices received by farmers that are used in the construction of the index of the general level of farm-product prices are based on reports from a group of voluntary respondents, most of whom are buyers of, or dealers in, farm products at country shipping points, and a few of whom are well-informed farmers. These reporters have increased in number with developments and needs of the work in the field of prices; at present (1947), reports are based upon returns from about 9,000 respondents. Before December 1923, prices of the major crops were reported on the first of the month by county reporters in connection with monthly crop reports. Beginning with December 1923 all monthly prices relate to the 15th of the month. The 1st-of-the-month prices for the period before December 1923 have been adjusted to approxi-

mate 15th-of-the-month prices by taking the average of previously estimated prices for the first of 2 consecutive months. The monthly prices of livestock have related to the 15th of the month since the beginning of the series in January 1910.

The current construction of index numbers of farm-product prices is based upon local market prices for 48 important agricultural commodities sold by farmers. The commodities are arranged into two major groups, crops and livestock. There are seven crop subdivisions: (1) Food grains, (2) feed grains and hay, (3) cotton, (4) tobacco, (5) oil-bearing crops, (6) fruits, and (7) truck crops. The three livestock subdivisions are (1) meat animals, (2) dairy products, (3) poultry and eggs. The weights currently used in computing the index numbers are annual averages of sales during the period 1935-1939. Price series for individual commodities are weighted by the quantity of the commodity sold, with minor adjustments to give some representation in the subgroups to commodities not included in the index. Since 1921, the index numbers have been issued on an August 1909-July 1914 base, but the weights (based on the volume of marketings) have been shifted from those of 1918-1923 to 1924-1929, and later to marketings during the most recent prewar years, 1935-1939.

**E 98-100. Index numbers of prices paid by farmers, 1910-1945.** SOURCE: Bureau of Agricultural Economics. For 1910-1943, see *Crops and Markets*, April 1944; for 1944-1945, see *Agricultural Outlook Charts, 1947*, book II, p. 13. Prices of commodities bought by farmers are reported by approximately 17,000 voluntary reporters, composed in the main of independent retail merchants serving the farm population of the United States. The series of estimates of prices paid by farmers used in the construction of the rural retail price index were obtained only on an annual basis from 1910 to 1922. Since that time most items have been priced quarterly in March, June, September, and December. Feed prices have been gathered monthly in recent years.

The index of prices paid by farmers is based upon 179 individual items farmers buy; 86 items used for farm family living and 93 commodities used in farm production. The broad category of items bought for maintenance of the farm family is classified into the following groups: Food (22 items), clothing (17 items), supplies (11 items), furniture and furnishings (21 items), motor vehicles (1 item), and building materials for houses (14 items). The group of commodities used in production is also broken down into subgroups: Feed (12 items), farm machinery (30 items), motor vehicles (3 items), fertilizer (7 items), building materials (19 items), equipment and supplies (15 items), and seed (7 items).

The weights used in computing State and national averages of prices paid are estimated quantities bought by farm families. For most cost-of-living commodities these estimates were obtained by multiplying the number of farms by the average purchases per farm family for each item as shown by the reports on Family Income and Expenditures from the *Consumer Purchases Study, 1935-36*, Bureau of Human Nutrition and Home Economics, United States Department of Agriculture. For production goods, weighting factors are based on indicators of volume of purchases derived from data compiled by the Bureau of the Census, the Bureau of Agricultural Economics, and other official and trade source materials.

**E 101-103. Index numbers of prices paid, including interest and taxes payable per acre, 1910-1945.** SOURCE: See text for series E 95-104, above. National averages of prices paid for items farmers buy are combined into the index of prices paid by farmers by weighting each according to its relative importance with regard to farm expenditures during the six years 1924-1929. The index of prices paid by farmers for commodities is combined with indexes of interest payable per acre on mortgage indebtedness and of taxes payable per acre on farm real estate to obtain the index of prices paid, interest, and taxes by giving prices paid for commodities a weight of 86.0 percent, interest 7.2 percent, and taxes 6.8 percent.

**E 104. Parity ratio, 1910-1945.** SOURCE: See text for series E 95-104, above. The original "prices paid" series of index numbers, prepared in 1928 and revised in 1933-34 on the basis of later data, was brought into prominence by the Agricultural Adjustment Act of 1933 which set forth the often-quoted definition of the parity principle and declared that it was the policy of Congress, among other things, to: "... reestablish prices to farmers at a level that will give agricultural commodities a purchasing power with respect to articles that farmers buy, equivalent to the purchasing power of agricultural commodities in the base period . . ." Thus the legislative basis for parity as a definite part of American agricultural policy was established.

A later enactment provided for the inclusion of interest and taxes per acre in the case of all commodities with an August 1909-July 1914 base. Neither this nor other minor modifications, however, altered either the basic concept of parity or the dominant role of the prices-paid series in its determination.

#### FARM MACHINERY AND EQUIPMENT AND FERTILIZER CONSUMPTION (E 105-116)

**E 105-110. Farm machinery and equipment, 1850-1945.** SOURCE: Department of Agriculture, Bureau of Agricultural Economics. See text for individual series below.

**E 105. Value of farm implements and machinery, decennial 1850-1910, annual 1911-1945.** SOURCE: For 1850-1910, see Bureau of the Census, Thirteenth Census of the United States, *Agriculture*, vol. V, p. 51; for 1911-1945, see Bureau of Agricultural Economics, *Progress of Farm Mechanization*, Misc. Pub. 630, October 1947, p. 83. This series represents inventory value at the beginning of the year. These figures are closely tied to the values enumerated by the Census of Agriculture, the intercensal years being estimated from information on manufacture and sales with due allowance for wear and tear and then adjusted for changes in price levels.

For the period 1850-1910, the data shown are not entirely comparable. These are data from early censuses which were taken on different dates and cover periods of vastly different price levels and attendant investment values. They also include the period of expansion into the West. According to the source, however, "the data are sufficiently comparable to indicate in a broad way the agricultural progress of the country . . ."

**E 106. Tractors on farms, January 1, 1910-1945.** SOURCE: Bureau of Agricultural Economics. For 1910-1928, see *Income Parity for Agriculture*, part II, sec. 3, "Purchases, Depreciation, and Value of Farm Automobiles, Motortrucks, Tractors, and Other Farm Machinery," August 1940, p. 56; for 1929-1945, see *Agricultural Statistics*, 1946, p. 582. Tractors on farms have been selected as indicative of the extent of mechanization of farming. The tractors counted in the series shown are mostly those with internal combustion engines. In the earlier years there had been considerable numbers of tractors powered by heavy steam engines capable of moving from farm to farm and used more for belt work than for pulling plows and other equipment except in the wheat fields of the West. Census counts of tractors were first made in the 1920 Census of Agriculture. Numbers in intercensal years are estimates reconciled to census years, and based on the Census of Manufactures and surveys of the life and cost of tractors.

**E 107. Sales of farm equipment, machinery and parts (for use in the United States from domestic manufacture), 1920-1945.** SOURCE: For 1920, see below; for 1921-1928, see Bureau of the Census, *Manufacture and Sale of Farm Equipment*, annual issues for that period; for 1929-1945, see same agency, *Facts for Industry*, M35A, Supplement 1, "Farm Machines and Equipment Sales for Export, 1940-1945," January 1947. The Bureau of the Census has obtained essentially complete data on production of farm machinery and equipment and has segregated the items sold for export from those sold for use in this country. The series here pre-

sented makes appropriate deduction for the amounts sold for uses other than on farms. The values represent manufacturers' prices. The enumeration of 1921 covered only a few items, 7 categories totaling \$59,759, and has therefore been omitted. For 1931 the value of export sales was not segregated, and no data were collected for the years 1932, 1933, and 1934. For 1920 the Department of Agriculture made an extensive survey which was reported in detail in *Circular 212*.

**E 108-110. Farmers' expenditures for farm machinery and equipment, 1910-1945.** SOURCE: Bureau of Agricultural Economics. For 1910-1939, see *Net Farm Income and Parity Report, 1943*, July 1944, p. 27 (processed); for 1940-1945, see *Farm Income Situation*, June-July 1947. These estimates cover purchases made by farmers annually for farm machinery and equipment to be used on farms. Expenditures for motor vehicles include the part for automobiles allotted to farm production, amounting to 50 percent of the value 1942-1945 and to 40 percent before 1942. Motortrucks and tractors are included with automobiles (for production) in the estimates of expenditures for motor vehicles. The figures in these columns do not include expenditures for current operation of the farm machinery and equipment.

**E 111-114. Commercial fertilizer consumption, decennial 1850-1890, annual 1891-1945.** SOURCES: Compiled by A. L. Mehring, Bureau of Plant Industry, Soils, and Agricultural Engineering, Department of Agriculture, from sources mentioned below and other data. Some of the data have been published in the *Journal of the American Society of Agronomy*, vol. 37, No. 8, pp. 595-609; the remainder were prepared in the manner there indicated.

The short ton and the calendar year are employed throughout these series. The term *commercial fertilizer* as used here includes any substance containing nitrogen (N), phosphoric acid ( $P_2O_5$ ), potash ( $K_2O$ ), or any other recognized plant-food element or compound, such as lime (CaO), magnesia (MgO), boron (B), etc., which is consumed primarily for the purpose of supplying plant food to crops, except unmanipulated manures. Thus barnyard manures are excluded but dried animal manures sold commercially are included. Ground phosphate rock, gypsum, sulfur, borax, copper sulfate, manganese sulfate, zinc sulfate, cottonseed meal, dried blood, animal tankage, etc., are included when sold to farmers to be used as sources of plant food in promoting crop growth, but are excluded when sold as fungicides, animal feeds, or for any other purpose than as plant food. Limestone, dolomite, magnesia, etc., when used as components of mixed fertilizers are included but when sold as soil amendments are excluded. By *soil amendments* is meant materials used to change the physical properties or the acidity of the soil rather than to supply plant food.

The method of calculating the tonnages of nitrogen, phosphoric acid, and potash has been published in detail in *U. S. Dept. Agr. Circ. No. 315*, p. 19 (1934).

The data include all commercial plant food. That means that they include the tonnage distributed by the Field Service Branch of the Production and Marketing Administration (formerly the Agricultural Adjustment Agency and before then the Agricultural Adjustment Administration) in its soil-building program and that used by the Tennessee Valley Authority in test demonstrations. The figures also include the tonnages consumed in the territories.

The territories of Hawaii and Puerto Rico are included because they use relatively very large quantities of plant food and because the preparation of a part of the data required the use of other basic figures that also include the territories. Other noncontiguous territories such as Alaska do not use significant quantities, although Alaska has recently started to use a few hundred tons annually. That the figures may be comparable throughout the table, they include the consumption in Hawaii even before it was part of the United States. Puerto Rico began the use of commercial fertilizer right after becoming a territory of the United States.

The total consumption of the two territories increased from about 3,000 tons in 1890 to 50,000 tons in 1900, 80,000 tons in 1910, 120,000 in 1920, 262,000 in 1930, 320,000 in 1940, and 315,000 tons in 1945.

The plant food consumption in the territories in 1935, 1940, and 1945 was as follows: Nitrogen, 31,700, 41,900, and 43,000 tons; phosphoric acid, 14,000, 18,000, and 18,000 tons; potash, 16,600, 26,500, and 28,000 tons, respectively. The data are not available for years prior to 1935.

The earliest data on consumption of fertilizers were collected by State fertilizer control officials. The first volume of *American Fertilizer*, 1894, p. 101, gives such figures for Georgia for the years 1875 to 1892, inclusive. In 1945 the Fertilizer Control Office, or a similar State Agency, of each of 36 States published tonnages of fertilizers consumed in their States during the previous period. A bibliography of such reports is given by Mehring in *United States Department of Agriculture Circular No. 756*, 1946, which also gives considerable detail concerning 1943 and 1944 consumption in all States and some trends in consumption, as shown by comparisons with earlier years.

The total United States consumption has been estimated annually by the National Fertilizer Association for many years. *The Fertilizer Review*, vol. XXI, No. 2, pp. 11-14, gives figures for continental United States by decades from 1880 to 1910, and annually from 1910 to 1945. For recent years the same issue of the *Review* gives figures for individual States and regions, and by type of distribution.

The consumption of each kind of fertilizer material and the total of all materials are given in the 1939 *Yearbook of Commercial Fertilizer*, pp. 34-35, by decades from 1850 to 1920 and annually from 1925 to 1937. Similar data for the years 1938 to 1945 are presented in *American Fertilizer*, vol. 106, No. 5, pp. 7-9 (1947).

Consumption of plant nutrients is set forth on page 81 of *U. S. Department of Agriculture Misc. Pub. No. 586* for all years 1900 to 1944, inclusive. These figures are for the commercial distribution only. Total consumption of nitrogen (N), phosphoric acid ( $P_2O_5$ ), and potash ( $K_2O$ ) in agriculture is given by Mehring, Wallace, and Drain in *Journal of the American Society of Agronomy*, vol. 37, No. 8, pp. 595-609. This article also includes data for each State and region, 1935 to 1944. A statistical analysis of fertilizer consumption and prices was published by E. E. Vial in *Cornell Univ. Agr. Expt. Sta. Memoir*, No. 119 (1928).

The Department of Agriculture and National Fertilizer Association (NFA) have made a number of surveys of fertilizer and plant food consumption for certain years which give considerably more detail than is normally available. The first of these was made by E. A. Goldenweiser for 1917 and 1918 and was published as *Dept. Agr. Bul. No. 798*, 29 pp. (1919). The next was prepared for 1925 by the National Fertilizer Association, but the results were never fully published. Joint surveys were made by the Dept. Agr. and the NFA for the fiscal years ending June 30, 1934, 1939, and 1943. These were published as special bulletins by the NFA. Surveys for 1941 and 1944 were published as *U. S. Dept. Agr. Circular No. 689*, 55 pp. (1943), and *No. 756*, 28 pp. (1946).

**E 115. Farmers' expenditures for fertilizer and lime, 1909-1945.** SOURCE: Bureau of Agricultural Economics. For 1910-1939, see *Net Farm Income and Parity Report, 1943*, July 1944, p. 22 (processed); for 1940-1945, see *Farm Income Situation*, June 1946, p. 26 (processed).

**E 116. Lime consumed on farms, 1909-1945.** SOURCE: Bureau of Agricultural Economics. For 1909-1928, see *Income Parity for Agriculture*, part II, sec. 2, "Farmers' Expenditures for Fertilizer and Agricultural Lime," October 1940; for 1929-1945, see *Agricultural Statistics*, 1945, table 60, p. 465, and 1946, table 645, p. 594. This series associates two series not quite alike in coverage. For 1929-1945 the tonnage is in terms of ground limestone, materials

in other forms being converted to that basis, except for some coarser materials used in Illinois. These figures were based on surveys made by State agricultural college agronomists and include county surveys of producers and data from county extension agents and AAA offices, assembled by C. E. Carter of the Production and Marketing Administration. The data for 1910, 1920, and 1925-28, however, were assembled by A. L. Mehring, of the Bureau of Plant Industry, Soils, and Agricultural Engineering. The intervening years were interpolated. Mehring's figures, with the interpolations, have been carried through 1939 in the Bureau of Agricultural Economics series *Income Parity for Agriculture, pt. II, sec. 2*. Hence, the figures given there for 1929-1939 differ from those in this series. Lime used by fertilizer manufacturers in their mixed goods is not included.

### Livestock, Meat, Dairying, and Poultry: Series E 117-180

#### LIVESTOCK (E 117-135)

**E 117-135. Livestock: Number, value, production and prices, 1867-1945.** SOURCE: See text for individual series which follow. See also Bureau of the Census, *United States Census of Agriculture: 1945*, vol. II, which presents a complete history of the enumeration of livestock and a discussion of the comparability from census to census.

**E 117, 119, 121, 123, 125. Number of livestock on farms, January 1, 1867-1945.** SOURCE: For 1867-1919, see Bureau of Agricultural Economics, *Livestock on Farms, January 1, 1867-1935*, January 1938; for 1920-1945, see Production and Marketing Administration, *Livestock Market News, 1946*, September 1947. These estimates have been made by the Department of Agriculture since 1867. The early estimates were based on reports of field agents and crop reporters giving their estimate of the percentage change in numbers from the previous year. The Census Bureau furnished the basic figures to which these percentage changes were applied over 10-year periods. This method was in general use until about 1920. Since then annual estimates are based primarily on survey returns from livestock producers, obtained largely in cooperation with the Post Office Department through the rural carriers. Producers report on the number and different classes of livestock on their own farms about December 1 each year. Records of livestock assessed for taxation in the various States have furnished indications of the annual percentage change in numbers, and records of marketings and slaughter have been used both by States and for the United States as check information on the inventory numbers.

Data from the Census of Agriculture have been used as periodic "bench marks" for the January 1 estimates but over the entire period there are few census years when the estimate for the census year (made by the Department of Agriculture) and the census data are in close agreement. There are various reasons for these differences. One of the main reasons is that there are only a few times when the census was taken as of January 1. In years when the census relates to a different date than January 1, adjustments are made to determine a January 1 equivalent number. Over a period of several years, ending in 1937, the Department of Agriculture undertook a general revision of all of the estimates prior to 1920 to correct for irregularities in the early series and to utilize more fully the records of numbers assessed for taxation and other information not considered in preparing the original estimates. A full description of the methods used and problems involved is contained in *Livestock on Farms, January 1, 1867-1935* (cited above).

**E 118, 120, 122, 124, 126. Value per head of livestock on farms, January 1, 1867-1945.** SOURCE: Bureau of Agricultural Economics. For 1867-1929, see *Livestock on Farms, January 1, 1867-1935*, Jan. 1938; for 1930-1945, see *Livestock on Farms, January 1*, Feb. 18, 1947 (processed release). These data are based on values reported by crop reporters for their locality about January 1 each year.

Prior to 1920, reporters gave a single estimate of the value per head for a given species. Since 1920 the estimates of value per head are weighted averages based on values per head reported separately for the different age and sex classes of a given species—using as weights the estimated number in the respective class.

**E 127, 130, 132. Live weight production, 1909-1945.** SOURCE: Bureau of Agricultural Economics, *Meat Animals, Farm Production and Income, 1924-1944*, Sept. 1947. Data for 1945 are from records of BAE. Production in live weight relates to the total poundage produced on farms and ranches during a calendar year. The estimate of production is derived by determining for each State a balance sheet which shows as debit items the inventory at the beginning of the year, the births, and inshipments, and as credit items, the marketings, farm slaughter, death losses, and numbers on hand at the end of the year. Estimates of average live weight are based on reports from slaughterers, collected by the Department of Agriculture and Census of Manufactures, and on records obtained from stockyards. In recent years, reports have been obtained from farmers as to the average weight of livestock slaughtered on farms. Earlier estimates were based on the average live weight obtained from the other sources mentioned. The total live weight for the beginning and for the end of the year is obtained by multiplying estimates of the different age and sex classes for a species by an estimate of their respective average live weight. Live weight of marketings, farm slaughter, and inshipments is determined by multiplying the estimate for these items by the respective average live weight. To obtain production, the total weight of inshipments is subtracted from the combined weight of marketings and farm slaughter. Then the difference in the inventory weight between the beginning and end of the year is added or subtracted as the case might be.

**E 128, 129, 131, 133, 134. Prices received per hundred pounds by farmers, 1910-1945.** SOURCE: For 1924-1944, see Bureau of Agricultural Economics, *Meat Animals, Farm Production and Income, 1924-1944*, Sept. 1947. For other years, data were obtained from BAE records. The prices received by farmers for the different meat animals represent the estimated average annual price per hundred pounds. Price information is obtained from voluntary price reporters who furnish average local market prices each month. The estimates of monthly prices are weighted by monthly estimates of marketings to obtain the annual average. The monthly marketings are based on reports from stockyards and packers on monthly receipts of livestock by State of origin.

**E 135. Total workstock, 2 years old and over, on farms, 1920-1945.** SOURCE: For 1920-1929, data are from records of Bureau of Agricultural Economics; for 1930-1939, see same agency, *Agricultural Statistics, 1946*, table 472, p. 364; for 1940-1945, see same agency, *Livestock and Poultry on Farms, January 1, Number, Value Per Head, and Total Value, Revised Estimates 1940-1945*, February 1947 (processed).

#### MEAT (E 136-151)

**E 136-151. Meat slaughtering, production and price, 1899-1945.** SOURCE: Department of Agriculture, Production and Marketing Administration, *Livestock Market News, Statistics and Related Data, 1946*, September 1947.

**E 136-137, 140-141, 144-145, 148-149. Number of livestock slaughtered, 1900-1945.** SOURCE: See text for series E 136-151, above. The number of livestock slaughtered under Federal inspection is compiled by the Bureau of Animal Industry in connection with its regulatory functions relating to meat inspection. Total slaughter includes Federally inspected slaughter and estimates of all other slaughter which is classified in two categories, (1) other wholesale and retail slaughter, and (2) farm slaughter. Federally inspected slaughter includes animals condemned as unfit for human food. Estimates of the number of animals slaughtered in other wholesale and retail channels are based on reports from slaughter-

ers who are not under Federal inspection and on other available records of the movement and disappearance of livestock.

Before 1944, information on this class of slaughter was obtained largely on an annual basis from various sources. Beginning in 1944, information has been collected by months, first under the slaughter control program of the War Food Administration, and later under the slaughter and meat control programs of OPA. Estimates of farm slaughter are based on voluntary reports from livestock producers who report annually on the number of animals of each species slaughtered on their farms. The periodic enumerations of farm slaughter by the Bureau of the Census are used as "bench marks" for the farm slaughter estimates.

**E 138, 142, 146, 150. Production of meat, dressed weight, 1899-1945.** SOURCE: See text for E 136-151, above. Production of the different kinds of meat are computed from estimated average live weights and dressing yields, and except for pork the meat output is shown on a carcass weight basis. The pork production represents carcass weight excluding the raw fat rendered into lard.

The data on production under Federal inspection are prepared by the Production and Marketing Administration of the Department of Agriculture, and are based on records of production and yields reported monthly by slaughterers operating under Federal inspection. Monthly estimates of production under Federal inspection are not available prior to 1921. Reports of the biennial Census of Manufactures on slaughter were used as a basis for annual production estimates for years for which they are available. In other years the estimates were based on information obtained from market records and other sources. Currently, information on weights and yields for other wholesale and retail slaughter is based on monthly reports from commercial slaughterers who are not under Federal inspection.

**E 139, 143, 147, 151. Prices of livestock at Chicago, 1899-1945.** SOURCE: See text for series E 136-151, above; see also the *Drovers Journal Yearbook of Figures*, Chicago, and the earlier editions of *Livestock Market News* for data for the early years. Prices of the different species of livestock at Chicago for the early years are from records published in the *Drovers Journal Yearbook*. Beginning in 1922, the price of beef steers at Chicago is based on records of all steers sold out of first hands for slaughter. The number of head, live weight, and total value of steers, by grades, are compiled by weeks. The annual prices represent the weighted average of all grades of steers sold during the year for slaughter. Since 1919, the average price for veal calves is based on the average of daily quotations. The average price of hogs at Chicago has been obtained from different sources, also. Since 1920, the average price of hogs is the weighted average of packer and shipper purchases at the Chicago market. Since 1921, the price of lambs at Chicago represents an average computed from the bulk of sales price data. All price data for Chicago shown in these series are prepared by the Production and Marketing Administration of the Department of Agriculture.

#### DAIRYING (E 152-170)

**E 152-170. General note. Cows kept for milk and production and prices of milk and milk products, 1849-1945.** SOURCES: Bureau of Agricultural Economics and Bureau of the Census records. In general, the more recent years are from the BAE, and are either compilations of production reported by dairy plants or estimates based on data from various sources including the Census Bureau.

Early development of the dairy industry in the United States is indicated by export statistics of 1790; which showed the New England States, New York, and Pennsylvania producing considerable amounts of butter and cheese in excess of their consumption requirements. The growth and spread of the industry between that time and 1849, when statistics on dairying were first available through the national census, were described briefly in the *Agriculture Yearbook*, 1922, pp. 297-306. At the middle of the 19th

century, milk cows were rather generally distributed over the eastern half of the United States as far west as southern Wisconsin, eastern Iowa, western Missouri and Arkansas, and the eastern third of Texas. By 1860 there were appreciable numbers of milk cows in sections of the Pacific Coast States and in later years they gradually spread over the intervening territory. Dairy products sold by farmers in the early period were limited mainly to whole milk, farm-made butter, and farm-made cheese.

Prior to 1850 dairy products were produced mainly on farms. The 1849 census data on cheese production showed the bulk of this product coming from farms in the area extending from north-eastern Ohio eastward through New York and New England. Factory cheese production was in an experimental stage shortly before 1850, and made considerable progress during the next two decades. Although some butter was made in early cheese plants, the first commercial creamery was not established until 1861. Since that time factories have largely supplanted farms in the production of both cheese and butter. Farm cheese is now practically negligible and farm butter represents only about one-fifth of the total. The first condensery was established in 1856, but little interest was given the product until the Civil War. Unsweetened condensed milk was first produced in this country in 1885. The canned unsweetened product, known in trade circles as evaporated milk, now makes up about nine-tenths of all evaporated and condensed whole milk. Ice cream was produced and sold by some retail stores in the first half of the nineteenth century and wholesale plant distribution to dealers began about the middle of the century. However, most of the development of this industry has come in the last fifty years.

**E 152-153. Cows and heifers kept for milk, 1850-1945.** SOURCE: Bureau of Agricultural Economics. For 1867-1929, see *Agricultural Statistics*, 1941; for 1930-1939, see *Agricultural Statistics*, 1946; for 1940-1945, see *Livestock and Poultry on Farms, January 1, Number, Value Per Head, and Total Value, Revised Estimates 1940-1945, February 1947* (processed). BAE estimates also appear in the report *Livestock on Farms, January 1*, issued in mid-February each year. A summary and discussion of estimates over the 1867-1935 period is given in *Livestock on Farms, January 1, 1867-1935*, January 1938. Census data for 1850 to 1920 appear in Bureau of the Census, Sixteenth Census Reports, *Agriculture*, vol. III, pp. 606-607, and for 1925 to 1945 in *Census of Agriculture: 1945*, vol. II, p. 381.

From 1867 through 1945, the BAE data represent estimates of the number of cows and heifers 2 years old and over. The estimates are based on interpretation of data obtained in periodic enumerations of cow numbers by the Census of Agriculture (conducted by the Bureau of the Census), tax assessors, and other State agencies, together with the analysis of changes taking place in herds kept by a large sample of livestock reporters. Along with the annual estimates are shown the data on milk cow numbers obtained in the Censuses of Agriculture over the period. The wording of the census questions has not necessarily been comparable with the definitions represented by the estimates and has varied somewhat from one census enumeration to another. The census figures shown in each period represent the following classifications: For 1945, 1940, 1935, 1930 and 1925, cows milked during the previous calendar year (the 1945, 1935, and 1925 censuses were taken as of January 1, and those of 1940 and 1930 as of April 1); for 1920, dairy cows and heifers 2 years old and over, January 1; for 1910, an estimate of cows and heifers 2 years old and over, January 1, based on the April 15, 1910, enumeration of 20,625,000 cows and heifers kept for milk born before January 1, 1909; for 1900, cows kept for milk 2 years of age and over as of June 1, 1900; for 1890, 1880, 1807, 1860, 1850, milch cows (with no specific age designated) recorded as of June 1.

The data on value per head of cows and heifers kept for milk

are based on average prices for this type of animal reported by a group of farmers for their localities on January 1 each year.

**E 154. Milk production on farms, decennial 1889-1919, annual 1924-1945.** SOURCE: Bureau of Agricultural Economics and Bureau of the Census. For 1924-1945, see Bureau of Agricultural Economics, *Farm Production, Disposition, and Income from Milk, by States, 1946-47* (mimeographed). Beginning in 1924, the series represent estimates of calendar-year totals prepared by the Bureau of Agricultural Economics. The estimates are based on interpretations of periodic census enumerations, analysis of annual and monthly survey data on milk cows and milk production, and checks against information regarding milk utilization obtained from dairy plants and other sources. For 1919 and earlier years, the data are those of the Census Bureau based on its decennial agricultural census, and converted from gallons to pounds by use of a conversion factor of 8.6 pounds per gallon. For 1889, the census totals are the reported figures. For 1899 they include estimates for incomplete reports and for 1909 and 1919 include estimates of production on farms that reported milk cows, but failed to report milk produced. The 1889 and 1899 data were enumerated as of June the following year, the 1909 data as of April 15, 1910, and the 1919 data as of January 1, 1920.

**E 155. Whole milk sold from farms, decennial 1869-1919, annual 1924-1945.** SOURCE: See source cited for series E 154, above. Beginning in 1924, the figures are estimates prepared by the Bureau of Agricultural Economics. These are based on analysis of periodic Census enumerations and on survey data obtained from farmers on milk disposition and on dairy-plant records of milk received and production of manufactured dairy products made primarily from milk, together with indicated levels of fluid milk consumption. The data shown include both milk sold to plants and dealers and milk retailed by farmers directly to consumers. The data for 1919 and earlier years are from the Census of Agriculture conducted by the Bureau of the Census.

**E 156-162. Production of dairy products, 1849-1945.** SOURCE: For 1849-1929, see E. E. Vial, cited below; for 1930-1945, see Bureau of Agricultural Economics, *Production of Manufactured Dairy Products, 1945*, March 1947. For 1930-1945, data are totals obtained by the Bureau of Agricultural Economics in its annual enumeration of output of dairy manufacturing plants. For the years before 1930, the level of the figures is based mainly on the Census Bureau's enumeration of the output of dairy plants with intervening years having been interpolated for some products. The interpolation methods are fully discussed in Vial, E. E., *Production and Consumption of Manufactured Dairy Products*, Department of Agriculture Technical Bulletin 722, April 1940. For additional information see text for individual series below.

**E 156-158. Butter production, 1849-1945.** SOURCE: Series E 156-157: See text for series E 156-162. Series E 158: For 1849-1924, see Bureau of the Census, Sixteenth Census Reports, *Agriculture*, vol. III, pp. 606-607; for 1925-1945, see Bureau of Agricultural Economics, *Farm Production, Disposition, and Income From Milk, by States, 1946-47* (mimeographed). Farm butter production data for the census years from 1849 through 1939 were obtained from the Census of Agriculture enumeration. For years other than census years in the 1924-1945 period, the data represent estimates of the Bureau of Agricultural Economics based on production reported by a sample group of farmers.

Factory-butter figures from 1930 to date are for production of creamery butter as enumerated by the Bureau of Agricultural Economics. Figures for factory production for 1929, 1927, 1925, 1923, 1921, 1919, 1914, 1909, 1904, 1899, 1879, 1869, 1859, and 1849 are from the Census of Manufactures, conducted by the Bureau of the Census. The 1889 census data were revised upward to allow for incompleteness of the census enumeration. Annual figures on factory-butter production for the intercensal years were interpolated on the basis of receipts of butter at major central

markets during the 1879-1919 period and on factory production as reported by the Bureau of Agricultural Economics during the 1919-29 period.

Figures for total butter since 1924 represent the sum of the figures for the production of both farm butter and factory butter. Annual figures on total butter production for intercensal years before 1924 were interpolated on the basis of market receipts. As interpolations of total butter and factory butter were made independently, and no attempt was made to estimate farm butter as a separate product, data on farm butter production for intercensal years prior to 1924 are not shown separately.

**E 159-160. Cheese production, 1849-1945.** SOURCE: See text for series E 156-162, above. Total cheese production as shown here includes both factory production, shown separately, and farm production. Since 1926, it has been assumed that farm cheese was negligible, so factory production and total production are given as the same.

Data from 1930 to date represent totals of the plant enumeration by the Bureau of Agricultural Economics, of all types of cheese manufactured except cottage, pot, or bakers' cheese. For the years 1919, 1909, 1889, 1879, 1869, 1859, and 1849 the production figures for total cheese are those reported by the Census Bureau. For 1889, the census data were revised upward to allow for incompleteness of the census enumeration. Estimates of total cheese production for the intercensal years 1869-99 were interpolated on the basis of market receipts.

Data on factory production of cheese for 1929, 1927, 1925, 1921, 1914, and 1904 are those reported by the Census of Manufactures. Factory production of cheese for the intercensal years 1869-1919 was interpolated on the basis of market receipts and for the intercensal years 1919-29 and for 1923 on the basis of factory production reported by the Bureau of Agricultural Economics. Production of farm cheese for the intercensal years 1899-1927 were roughly projected on the basis of average change between census years and added to the factory product to obtain total cheese figures.

**E 161. Evaporated and condensed milk production, decennial 1869-1899, annual 1900-1945.** SOURCE: See text for series E 156-162, above. Data on evaporated and condensed milk from 1919 to date are totals of the Bureau of Agricultural Economics plant enumeration. Products included are evaporated milk, bulk unsweetened condensed whole milk, and case and bulk sweetened condensed whole milk. Production for the years 1914, 1909, 1904, 1899, and 1879 are the totals reported by the U. S. Census relating to the production of all condensed and evaporated milk. For 1889, the census data were revised upward to allow for incompleteness of enumeration. Data for 1869 are estimated, and for the non-census years before 1919 represent an estimated trend of production based on intervening census data.

**E 162. Ice cream production, decennial and quinquennial 1859-1919, annual 1920-1945.** SOURCE: See text for series E 156-162. Data for 1930 and later years are total ice cream production, as reported by the Bureau of Agricultural Economics, based on its plant enumeration. For the period 1919-1929 the data are estimates based on the Bureau of Agricultural Economics reported figures adjusted upward to allow for incompleteness of enumeration. For 1914, data were estimated from the Census of Manufactures. For 1909 and earlier years, the data represent merely an estimated trend of production.

**E 163-164. Milk equivalent of manufactured dairy products, 1849-1945.** SOURCE: For series E 163, see text for series E 156-162. For series E 164, data are from records of Bureau of Agricultural Economics. Two series of milk equivalent figures for manufactured products are shown here. The series of milk equivalents prior to 1930 (series E 163) is based on national production of manufactured dairy products converted to milk equivalent on the basis of somewhat less refined conversion factors than those used for series E 164. As such, they include no allowance for shifts in production between

areas of high- or low-testing milk, and assume standard butterfat content of the products over the series of years.

From 1930 through 1945 data were computed on a State basis (series E 164), utilizing information on quantities of products made in each State and State conversion factors for each product. These data include the milk equivalent of farm butter. Duplications of milk usage involving the production of butter from whey fat recovered from cheese making, and the use of butter and condensed milk in the production of ice cream, were eliminated. One year's overlap is shown to indicate the relative level of the two series.

**E 165-166. Wholesale prices, cheese and butter, 1830-1945.** SOURCE: Data are from records of Bureau of Agricultural Economics. The wholesale prices of cheese (series E 165) represent averages of weekly quotations on American twins on the Wisconsin cheese exchange at Plymouth. Before 1900, annual averages for this series were not available and the data shown represent prices for the month of September. The wholesale price of butter (series E 166) is that for the New York City market. Over the period of years since 1830, the data shown differ somewhat as to definition and source, as outlined in the tabular footnotes.

**E 167-170. Prices received by farmers for dairy products, 1909-1945.** SOURCE: Department of Agriculture. For 1909-1929, see *Crops and Markets*, April 1946, p. 96; for 1930-1945, see *Agricultural Statistics*, 1946. Prices received by farmers for butter, butterfat, wholesale milk, and retail milk are estimates prepared by the Bureau of Agricultural Economics. They are based on averages of survey data reported by dealers and farmers for their local market areas. Prices of butterfat (series E 168) represent the butterfat in farm skimmed cream sold by farmers. As survey information on this item was not collected before 1920, estimates for this period were extrapolated on the basis of trend in butter prices during this period.

Wholesale milk prices (series E 169) are for milk sold by farmers to plants and dealers including such establishments as cheese factories, condenseries, creameries, or market milk plants. In obtaining survey data on wholesale milk prices, prior to 1923, prices were asked on a per gallon basis and since that time in terms of price per 100 pounds. Additional historic information on wholesale milk-price series was collected by direct plant contacts during the middle 1930's when the State estimates were revised. A discussion of this series may be found in Johnson, R. E., *Wholesale Prices Received by Farmers for Whole Milk, 1909-36*, mimeograph publication, U. S. Department of Agriculture, Bureau of Agricultural Economics, February 1937.

Retail milk prices (series E 170) represent the milk retailed by farmers directly to consumers. Before 1923 survey information was collected on a price per gallon rather than per quart basis. Some of the increase in price between 1909 and 1945 probably represents additional services rendered in process of distributing the milk. A more detailed description of the price series on butter, butterfat, and retail milk will be found in Hale, R. F., and Shepard, J. B., *United States Average Farm Prices of Dairy Products, 1910-34*, mimeograph publication, Department of Agriculture, Bureau of Agricultural Economics, June 1934.

#### POULTRY AND EGGS (E 171-180)

**E 171-180. Poultry and eggs: Number, value and price, 1909-1945.** SOURCE: Bureau of Agricultural Economics. For 1909-1939, see *Agricultural Statistics*, 1942, tables 645, 646, 665, 669, 672; for 1940-1944, see release series on *Farm Production, Disposition, Cash Receipts, and Gross Income*, "Chickens and Eggs, 1940-1944" (revised estimates), and "Turkeys, 1940-1944" (revised estimates), April 1947 (mimeographed); for 1945 data, see same release series, "Chickens and Eggs, 1945-1946," and "Turkeys, 1945-1946." The estimates shown are believed to indicate, within reasonable limits of accuracy, the actual number of farm chickens and turkeys; the

production of chickens, turkeys, and eggs; and, with greater accuracy, the direction and extent of the changes from year to year.

Complete surveys of the hatchery industry are made every year in some States and every few years in all States. Monthly estimates of the production of baby chicks, based on returns from 15 to 25 percent of total hatchery capacity, are also made. These figures of hatchery output together with a determination annually of the proportion of all farm chicks that came from hatcheries, give a dependable check on the actual level of chicken and turkey production and on the trend from year to year indicated by sample flocks.

**E 171, 177. Number of poultry on farms, Jan. 1.** SOURCE: See text for series E 171-180, above. For census data on chickens, see Bureau of the Census, *Census of Agriculture: 1945*, vol. II, pp. 406-407; for census data on turkeys, see Sixteenth Census Reports, *Agriculture, Special Poultry Report*, p. 46. Estimates of inventory numbers of chickens on farms January 1 (series E 171) are based primarily upon the census enumerations. These enumerations from 1910 to 1945 were adjusted for changes between January 1 and the average date of enumeration in each State, and cover only farm flocks as defined and enumerated by the Census Bureau. Estimates of change in numbers from year to year are based on rural carrier surveys made in December of each year, covering about 150,000 livestock farms, and on changes in flocks belonging to about 25,000 crop reporters. Although census enumerations of chickens on farms were made as of June 1, 1880, 1890, and 1900 (see source cited above), the Department of Agriculture did not make annual estimates of chickens on farms until 1909 because data showing annual changes prior to that date were not available.

Estimates of inventory numbers of turkeys on farms January 1 (series E 177) are based primarily upon the census enumerations of turkeys on farms January 1, 1935, and April 1, 1940, adjusted for changes in numbers between January 1 and the date of enumeration. In 1945, however, the census enumeration did not include turkeys on farms. The estimates of turkeys on farms January 1, 1945, were derived from the relationship between turkeys raised in 1944 and the number on hand January 1, 1945, as reported on January 1 by crop and livestock reporters, using as a base the revised estimates of turkeys raised in 1944 based on the census enumeration. Annual changes in the estimates for intervening years are based mainly on the numbers on hand as reported on January 1 by crop and livestock reporters. Although the Census Bureau enumerated turkeys on farms as of June 1, 1890 and 1900, April 15, 1910, and January 1, 1920 (for 1890 and 1900 data, see source cited above), the Department of Agriculture did not make annual United States estimates of turkeys on farms for years prior to 1929 because data showing annual changes before that date were not available.

**E 173, 175, 179. Poultry and eggs produced on farms.** SOURCE: See text for series E 171-180, above. Estimates of chickens (series E 173) and of turkeys (series E 179) produced on farms represent the net annual farm production computed from the number raised during the year, minus the death loss of chickens and of turkeys that were on hand at the beginning of the year. Young chickens and young turkeys of the current year's hatchings that die are not included in the number of chickens or turkeys raised.

Egg production (series E 175) is estimated from returns from about 25,000 crop respondents reporting on the first of each month for their own flocks the number of layers on hand and the eggs produced yesterday. Beginning with the estimated total number of layers on farms at the beginning of the year the change in numbers from month to month is estimated from the changes shown by reports from these survey farms. Revisions in the monthly average number of layers and total egg production are made at the end of the year if the change in number of layers shown by an annual survey with about 150,000 returns differ from the change

in the number of layers estimated during the year from monthly returns.

**E 172, 174, 176, 178, 180. Value and prices of poultry and eggs.** SOURCE: See text for series E 171-180, above. For census data, see 1945 source cited in text for series E 171, 177, above. The values per head of chickens and turkeys on hand January 1 (series E 172, 178) are estimated from the values reported by crop respondents. The average price per pound of chickens and turkeys live weight (series E 174, 180) and per dozen of eggs sold (series E 176) are computed from monthly local market prices, and the estimated quantities sold each month.

### Crop Statistics: Series E 181-243

**E 181-243. General note. Crop statistics, 1790-1945.** For sources and notes, see text for the specific series.

Estimates of acreage, yield, production, disposition, stocks, and prices of principal agricultural commodities are among the series of statistics prepared and published by the Crop Reporting Board of the Bureau of Agricultural Economics. For many of these crops, estimates of acreage, production, and prices are available beginning with 1866, the year in which regular reports were begun in the Department of Agriculture. A vast amount of such information is available for individual States and for the United States, for all major crops and most of the minor crops produced in this country, for periods of varying length. Of these many series only acreage, production, and price for the United States are presented here for corn, wheat, hay, oats, barley, flaxseed, soybeans, cotton and cottonseed, together with farm stocks of corn and wheat and the carry-over stocks of cotton in all positions. Statistics on sugar and tobacco crops are not included in this edition.

Data more detailed than are carried in this volume are readily available in various publications of the Department of Agriculture and the Bureau of the Census. The annual publication, *Agricultural Statistics*, particularly the issues of 1941 and 1946, presents most of the available statistics, chiefly on a national basis, covering every phase, from acreage and production of individual commodities to utilization and consumption. Forecasts for the current season, beginning with the Prospective Acreage report in March and carrying through the growing season, are presented monthly in the mimeographed publication of the Crop Reporting Board entitled *Crop Production*. A summary for the current season, revisions for the previous season, and comparisons with previous years, appear in the December issue. Both the forecasts and the summary are prepared on a State basis and for the United States. These data also appear in the Department organ, *Crops and Markets*. Other releases by the Crop Reporting Board present mid-month and season average prices received by farmers, value of sales and production, farm disposition, monthly sales, stocks in all positions, and numerous other phases connected with the various commodities. Periodically, revisions have been published for a relatively short period of the more recent years, thus connecting currently published data with the longer historical series. The most recent of these was issued in April 1947.

Information from the Censuses of Agriculture, conducted by the Bureau of the Census, beginning with the crop year 1849, is included in these series and shown in italics. Detailed reports and reports for counties are available from these censuses. In many instances census data are not entirely comparable with the estimates shown, but have furnished bench marks in establishing the level of the estimates. For years prior to 1866 information from trade sources is available for some crops, such as cotton, tobacco, and rice.

In preparing estimates such as those carried in this volume, the Crop Reporting Board of the Bureau of Agricultural Economics uses every available source of information. Chief reliance is placed upon reports received from volunteer farmer-reporters representing every part of every State. Check information is gathered from

processors, from transportation and storage facilities, from buyers of farm products, from annual State farm enumerations, from various farm programs, and from other governmental agencies such as the Bureau of the Census, the Bureau of Internal Revenue, and the Customs Office.

*Season average prices for each State* are averages of the mid-month prices weighted by the quantity sold each month in the crop-marketing season. The *crop-marketing season* is the 12-month period following the harvesting of the crop. It may vary for different crops, and for any crop it may vary by States. The *season average price of any crop*, as presented in this volume, is the average of all the State prices, weighted by the production of each State. Thus it may be applied to production in any given year to obtain a measure of the value of that production. State season average prices may be weighted by quantities sold in each State to obtain an average for the United States which may be applied to total quantities sold in the United States to measure value of sales in the crop season. In neither case, however, should the computed value be confused with calendar-year income from the crop. Estimates of quantity sold are based upon reports of receipts each month by the chief purchasers of the commodity—in the case of grains, the interior mills and elevators

*Mid-month prices* as estimated by the Crop Reporting Board are based upon reports from thousands of firms dealing directly with farmers (such as elevators, truckers, processors, produce dealers, etc.) and from farmers themselves, all reporting prices received by farmers for their products. Such reports are issued monthly for the principal farm commodities in *Agricultural Prices*. Season average prices for each State and the United States appear in various issues of these monthly reports and are all summed up in a December issue of *Agricultural Prices* and again in the report entitled *Farm Production, Farm Disposition and Value of Principal Crops*, issued each May. This series of season average prices begins for most commodities in 1908, but is supplemented for preceding years by a series reported by farmers on December 1, representing their estimate of average prices for the season's sales, and usually referred to as the December 1 price series. The two series overlap for a space of years sufficient to indicate that a close relation exists between them.

Crop statistics data shown here are the most recently revised data available at this time (June 1947). Insofar as possible, the sources indicated below for particular series refer to published material. In some instances, however, the data shown have not as yet been published. In all cases, the user is cautioned to note carefully the time periods indicated in connection with each source. The more current sources cited very frequently make obsolete only part of a series shown in an earlier source.

### CORN AND WHEAT (E 181-195)

**E 181-185. Corn acreage, production, prices, and stocks, 1839-1945.** SOURCE: Bureau of Agricultural Economics. Series E 181-182: For 1866-1928, see *Agricultural Statistics*, 1941; for 1929-1938, see *Agricultural Statistics*, 1946; for 1939-1944, see *Field and Seed Crops, Acreage, Yield, and Production (Revised Estimates, 1939-1944)*, April 1947 (processed); for 1945, see *Crop Production, 1946 Annual Summary*, December 1946. For Census data, see Bureau of the Census, *Census of Agriculture: 1945*, vol. II, p. 424. Series E 183: For 1908-1928, data are from records of BAE; for 1929-1942, see *Agricultural Statistics*, 1946; for 1943-1945, see *Agricultural Prices*, 1944, 1945, 1946, released December of each year (processed). Series E 184: For 1866-1907, see *Agricultural Statistics*, 1941; for 1908-1927, data are from records of BAE. Series E 185: For 1926-1939, see *Corn: Revised Estimates of Stocks on Farms, 1926-1941*, April 1943 (processed); for 1940-1945, see *Revised Estimates of Stocks on Farms*, July 1947 (processed). For additional information for series E 181-185, see general note for series E 181-243, above.

Corn for all purposes includes not only the production of corn on the acreage harvested for grain, but also an allowance for that harvested for silage, for forage, including some harvested by grazing farm animals, commonly called *hogging off*. Estimates of acreage harvested for grain, for silage, and for forage including that hogged off, and production of corn for grain and tons of silage are published by the Crop Reporting Board. The census data included here for acres harvested are not comparable with the production for 1924 through 1939, in that while the acreage harvested is for all purposes, the production is for grain only. The census figures on both acreage and production for 1919 and previous years represent amount harvested for grain only.

The crop-marketing season for corn in most States is October 1 to September 30; in Texas, August 1 to July 31; in Florida, Louisiana, and Oklahoma, September 1 to August 31.

Farm stocks (series E 185) have been estimated by States quarterly since 1926 by the Crop Reporting Board, based upon a large number of reports from individual farms. The United States total stocks on October 1 are shown here as they represent the farm carry-over for crops of previous years which becomes a part of the feed supply for the new season when added to the new crop of corn. In addition to farm stocks of corn, stocks in all off-farm positions have been compiled by the Crop Reporting Board since April 1943. Comparison with the farm stocks data indicates that the bulk of carry-over stocks of corn on October 1 of any year is still on farms.

**E 186-195. Wheat acreage, production, prices, and stock, 1839-1945.** SOURCE: Bureau of Agricultural Economics. Series E 186-187: See source cited for series E 181-182, above. Series E 188: For 1908-1929, see *Agricultural Statistics*, 1941; for 1930-1942, see *Agricultural Statistics*, 1946; for 1943-1945, see *Agricultural Prices*, 1944, 1945, 1946, released December of each year (processed). Series E 189: See source cited for series E 184, above. Series E 190: For 1926-1939, see *Stocks of Wheat on Farms, revised estimates, 1926-1941*, February 1943 (processed); for 1940-1945, see *Revised Estimates of Stocks on Farms*, July 1947 (processed). Series E 191-195: For 1926-1929, see *Agricultural Statistics*, 1941; for 1930-1945, see *Agricultural Statistics*, 1946. For additional information for series E 186-195, see general note for series E 181-243, above.

The statistics for all wheat are the combined estimates for winter, durum, and other spring wheat, harvested for grain. Separate series for each of these kinds are published by the Crop Reporting Board, also a breakdown by market classes. The census data on acreage and production are regarded as comparable with the estimates in most cases. The part of the wheat acreage that is harvested for hay is not included in these series of estimates.

The crop-marketing season for wheat in most States is July 1 to June 30; but for Kansas, North Carolina, South Carolina, Georgia, Tennessee, Alabama, Mississippi, Arkansas, Oklahoma, New Mexico, Arizona, and Texas the season is June 1 to May 31.

Farm stocks of all wheat have been estimated by States quarterly since 1926, based upon a large number of reports from individual farmers. The series presented here (series E 190) are the United States totals for July 1, representing the farm carry-over from previous crops at the beginning of a new crop year. The carry-over added to the new crop thus is the supply for the new season. Stocks in interior mills, elevators, and warehouses on July 1 (series E 192) have been estimated by the Crop Reporting Board since 1919 and stocks in other commercial storages have been gathered by other agencies for varying periods.

#### OATS, BARLEY, FLAXSEED, SOYBEANS (E 196-210)

**E 196-199. Oats for grain: Acreage, production, and price, 1839-1945.** SOURCE: Series E 196-197: See source cited for series E 181-182, above. Series E 198: For 1908-1928, see *Agricultural Statistics*, 1941; for 1929-1945, see *Agricultural Statistics*, 1946. Series E 199:

See source cited for series E 184, above. For additional information for series E 196-199, see general note for series E 181-243, above.

Oats for grain as estimated includes the acreage cut ripe and fed unthreshed. Oats cut green for hay are not included in this harvested acreage. Census data shown in italics are not comparable with the estimates, as they include only the acreage and production threshed. Data regarding farm stocks and stocks in off-farm positions are available in publications of the Crop Reporting Board.

**E 200-203. Barley for grain: Acreage, production, and price, 1839-1945.** SOURCE: Series E 200-201: See source cited for series E 181-182, above. Series E 202: See source cited for series E 198, above. Series E 203: See source cited for series E 184, above. For additional information for series E 200-203, see general note for series E 181-243, above. The estimates of barley acreage and production and the census data in italics are on a comparable basis, representing the acreage and production of barley for grain. That cut for hay is not included in this series. Farm-stocks data are available for a relatively short period and stocks in off-farm positions have been compiled only since April 1943.

**E 204-207. Flaxseed acreage, production, and price, 1849-1945.** SOURCE: Bureau of Agricultural Economics. Series E 204-205: See source cited for series E 181-182; except for series E 205, for 1866-1888, see *Revised Estimates of Flaxseed Production, 1866-1929*, July 1936 (processed). Series E 206: For 1908-1928, see *Agricultural Statistics*, 1941; for 1929-1945, see *Agricultural Statistics*, 1946. Series E 207: For 1902-1907, see *Agricultural Statistics*, 1941; for 1908-1927, data are from records of BAE. For additional information for series E 204-207, see general note for series E 181-243. The series of acreage, production, and prices for flaxseed are available in publications of the Crop Reporting Board. The census data shown are on a comparable basis. Flax grown for fiber is not included in the acreage estimates, nor is the flaxseed deseeded from fiber flax included in the production estimates. Estimates for fiber flax are available in the various publications of the Crop Reporting Board, however. The price series is relatively short, with the December 1 series available only from 1902.

**E 208-210. Soybeans for beans, acreage, production, and price, 1924-1945.** SOURCE: Series E 208-209: See source cited for series E 181-182. Series E 210: See source cited for series E 206. For additional information for series E 208-210, see general note for series E 181-243, above. A relatively short series of estimates of the acreage, production, and prices of soybeans for beans is available. The acreage grown for all purposes, alone and interplanted, and acreage and production of soybeans for hay, are also estimated by the Crop Reporting Board. The prices presented are the current series of season average prices prepared by weighting the mid-month prices received by farmers.

#### HAY AND COTTON (E11 2-224)

**E 211-216. Hay acreage, production and price, 1866-1945.** SOURCE: Bureau of Agricultural Economics. Series E 211: For 1909-1928, see *Agricultural Statistics*, 1941 (data for E 211 obtained by adding data for wild hay shown in this source to data for tame hay, E 212); for 1929-1934, see *Agricultural Statistics*, 1946; for 1935-1945, see *Field and Seed Crops, Acreage Yield and Production (Revised Estimates, 1939-1944)*, April 1947 (processed). Series E 212, 214: For 1866-1928, see *Agricultural Statistics*, 1941; for 1929-1938, see *Agricultural Statistics*, 1946. Series E 213: For 1909-1928, see *Farm Production, Farm Disposition, and Value of Hay, 1909-1941*, September 1944 (processed); for 1929-1945, see source cited for series E 211. Series E 215: For 1909-1928, data are from records of BAE; for 1929-1945, see *Agricultural Statistics*, 1946. Series E 216: For 1866-1928, see *Agricultural Statistics*, 1941; for 1929-1938, data are from records of BAE. For additional information for series E 211-216, see general note for series E 181-243, above. The series for tame hay, beginning 1866, was discontinued with the 1939 estimates. The series for all hay began in 1909 and continues cur-

rently. Census enumeration data are comparable with the series with which they are included. Farm stocks of hay are estimated, as of January 1 and May 1 of each year, by the Crop Reporting Board, and are published in *Crop Production*.

The price series shown in the table for all tame hay is the December 1 series throughout, but that for all hay is the season average of the mid-month price throughout. The latter series is being continued currently.

**E 217-224. Cotton and cottonseed: Acreage, production, prices and stocks, 1790-1945.** SOURCE: Series E 217: For 1866-1928, see *Agricultural Statistics*, 1941; for 1929-1942, see *Agricultural Statistics*, 1946; for 1943-1945, see BAE, *Cotton Report*, Dec. 1, 1946 (processed). For census data, see Bureau of the Census, *Census of Agriculture: 1945*, vol. II, p. 428. Series E 218: For 1790-1898, see Department of Agriculture, Bureau of Statistics, *Circular 32*, 1912; for 1899-1928, see *Agricultural Statistics*, 1941; for 1929-1945, see *Agricultural Statistics*, 1946. For census data, see Bureau of the Census, *Census of Agriculture: 1945*, vol. II, p. 428. Series E 219: See source cited for series E 198. Series E 220: For 1869-1875, see Department of Agriculture, Bureau of Statistics, *Circular 32*, 1912; for 1876-1907, see *Agricultural Statistics*, 1941; for 1908-1927, data are from records of BAE. Series E 221: For 1906-1939, see *Agricultural Statistics*, 1941; for 1940-1945, see *Agricultural Statistics*, 1946. Series E 222: For 1909-1927, see *Agricultural Statistics*, 1941; for 1928-1944, see BAE, *Farm Production, Farm Disposition, and Value of Cotton and Cottonseed*, October 1945 (processed); for 1945, see *Agricultural Statistics*, 1946. Series E 223: For 1909-1927, see BAE, *Cotton Acreage, Yield and Production, 1866-1938*, Sept. 1940 (processed); for 1928-1945, see source cited for series E 222. Series E 224: Data are from records of BAE. For additional information for series E 217-224, see general note for series E 181-243, above.

Bureau of the Census farm enumeration data on acreage and production for census years are shown in italics. The production, shown in running bales, is not comparable with annual production estimates shown in 500-pound gross-weight bales. The net weight per running bale varies from 383 pounds in 1839, the first census period, to 496.1 pounds in 1944, the most recent census year.

Cotton production estimates are defined by statute as cotton actually ginned. From 1913 to 1924 annual ginnings as published by the Bureau of the Census included some cotton produced in Lower California and Mexico and ginned in California. Although this cotton was ginned in this country, it is not included in the production of the United States. For those years, cotton ginned in the United States exceeds production by the quantity of the cross-border movement of seed cotton into this country. For all other years beginning in 1899, production of cotton is the quantity of census ginnings by States adjusted for cross-State movement of seed cotton and rounded to thousands of bales. The rounded State-production estimates are added, to obtain the production for the United States. Adding the rounded State totals has resulted in a United States production that differs slightly from the census report on ginnings, but the difference is inconsequential.

Before 1899 the total production was compiled from various current sources including exports and imports, rail and water shipments, mill receipts, etc., together with the decennial enumerations of the Bureau of the Census. These production estimates are the same as published August 15, 1912, in Department of Agriculture, Bureau of Statistics *Circular 32*, except for minor adjustments caused by rounding State estimates.

Stocks on August 1 of the crop-year (series E 221) are given in running bales, except that any small quantity of foreign cotton which is included is in equivalent 500-pound gross-weight bales. Previous to 1914 stocks are as of September 1. Data on stocks shown for the years beginning with 1923 were compiled by the Bureau of the Census. Stocks for years before 1923 are from the New York Cotton Exchange Service.

Cottonseed production (series E 222) beginning in 1928 is computed from net lint production using ratios of cottonseed to cotton lint as estimated from survey data collected from cotton ginners. For the years 1927 back to 1866 a uniform ratio of 65 pounds of cottonseed for each 35 pounds of net lint was used in computing cottonseed production.

The season average prices from 1908 to date for both cotton and cottonseed (series E 219 and 223) are the weighted averages of mid-month prices. For years before 1908 the price series for cotton (series E 220) is the judgment price for the season as reported by farmers on December 1. Cottonseed prices are not available for the years before 1909. In order that comparisons of the price series may be made, the December prices for 20 years in which the two series overlap are shown.

The crop-marketing season for both cotton and cottonseed is August 1 to July 31 for all States except Texas where the marketing season begins about mid-July.

#### FRUITS AND VEGETABLES (E 225-243)

**E 225-230. Irish and sweetpotatoes, acreage, production and price, 1849-1945.** SOURCE: Bureau of Agricultural Economics and Bureau of the Census. For census data, see *Census of Agriculture: 1945*, vol. II, pp. 519-521. Series E 225, 228, 229: For 1866-1928, see *Agricultural Statistics*, 1941; for 1929-1938, see *Agricultural Statistics*, 1946; for 1939-1945, see *Crop Production, 1947 Annual Summary*, December 1947. Series E 226: For 1866-1944, see source cited for series E 225; for 1945, see *Crops and Markets*, 1947. Series E 227, 230: For 1866-1938, see source cited for series E 225; for 1939-1944, see *Prices Received by Farmers for Crops, Livestock, and Livestock Products, 1909-45* (revised reprint from *Crops and Markets*), 1946; for 1945, see *Season Average Prices and Value of Production, Principal Crops, 1945-46, by States* (mimeographed), Dec. 17, 1946. For additional information for series E 225-230, see general note for series E 181-243, above.

**E 231-243. Fruit production and prices, 1889-1945.** SOURCE: Bureau of Agricultural Economics and Bureau of the Census. For census data, see *Census of Agriculture: 1945*, vol. II, p. 534. Series E 231-239: For 1889-1944, see *Production, Farm Disposition, Value, and Utilization of Sales, 1889 to 1944* (in press); for 1945, see same, *1945 to 1947* (in press). Series E 240-243: For 1909-1939, see *Citrus Fruits—Production, Farm Disposition, Value, and Utilization of Sales, Crop Seasons 1909-10 to 1943-44* (mimeographed), October 1945; for 1940-1945, see same, *Crop Seasons 1940-41 to 1946-47* (mimeographed), October 1947. For additional information for series E 231-243, see general note for series E 181-243, above.

Estimates of fruit production relate to the harvested crop plus allowances for economic abandonment in years when appreciable quantities are not harvested because of low prices or other economic factors. Losses from natural causes, such as wind storms, freezes, etc., are not included in production. Production relates to the total crop produced on farms, including commercial and home production, except for apples, for which BAE production estimates, 1935-1945, relate to commercial areas only.

The annual estimates of BAE are checked and adjusted at the end of each marketing season on the basis of shipment and processing records that are available from transportation agencies, processors, cooperative marketing associations and other industry organizations. The estimates are again checked and revised at 5-year intervals when the Bureau of the Census enumerates and publishes for census years the numbers of trees and harvested production of fruits, by kinds, in each State and county. The BAE estimates for census years are not always in agreement with census data because of allowance for economic abandonment and adjustments based on available shipment and processing records.

Citrus and other fruits (series E 240-243) are valued at equivalent per unit returns, excluding packing, grading and container costs, rather than at average prices for all sales.

## Farm Credit: Series E 244-269

## FARM MORTGAGES (E 244-255)

**E 244-251. Farm-mortgage credit: Debt outstanding and loans closed, 1910-1945.** SOURCE: Bureau of Agricultural Economics, Bureau of the Census, Farm Credit Administration, and Federal Deposit Insurance Corporation. For specific sources, see below.

Farm-mortgage credit has variously been referred to as farm-real-estate credit, long-term credit, or capital credit. The data presented here, however, merely represent the amount of credit secured by farm real estate, whether it be extended for short terms or long terms, or whether it be used for such purposes as purchasing the farm, operating the farm, or financing nonagricultural activities. Furthermore, they represent credit extended under all types of loan instruments, whether they be mortgages, deeds of trust, vendors' liens, or sales contracts, so long as the security offered is farm real estate.

Information on the number of mortgaged farms has been collected by both the Bureau of the Census and the Bureau of Agricultural Economics. Generally speaking, the data on number of mortgaged farms have been published along with the data on amount of debt in census years, with the exception of 1900 when no information on amount of debt was obtained. A historical summary and an analysis of the data on number of mortgaged owner-operated farms back to 1890 are included in an article on "Number and Percentage of Farms Under Mortgage" in the *Agricultural Finance Review*, vol. 1, No. 2, November 1938, issued by the Bureau of Agricultural Economics. Data on the number of mortgaged farms in each tenure class for 1930, 1935, and 1940 appear in a cooperative publication of the Bureau of Agricultural Economics and the Bureau of the Census entitled *Farm-Mortgage Indebtedness in the United States, Release No. 1—Number of Mortgaged Farms*, June 25, 1943. Similar data for 1945, as well as for the census years just mentioned, can be found in another joint BAE-Census report, *Farm-Mortgage Debt in the United States: 1945*.

Estimates of the total amount of farm-mortgage debt outstanding at the beginning of each year (series E 244) and the amount of loans held by the principal lender groups (series E 245-249) are available back to 1910. The estimates of total indebtedness are based upon census data and the results of special surveys. The Bureau of the Census obtained data on the amount of mortgage debt resting on farms operated by full owners in each census back to 1890, except 1900. In 1890, 1940, and 1945 it collected similar information on the owned part of part-owner farms.

Mortgage data may be found in the following reports of the Bureau of the Census: Eleventh Census of the United States, 1890, *Report on Real Estate Mortgages*; Thirteenth Census, 1910, *Agriculture*, vol. V, ch. 3; Fourteenth Census, 1920, *Agriculture*, vol. V, ch. 7; Census of Agriculture, 1925, *Summary Statistics by States*; Fifteenth Census, 1930, *Agriculture*, vol. IV, Ch. 6; Sixteenth Census, 1940, *Agriculture*, vol. III, ch. 4. Data for 1935 and 1945 appear only in the cooperative publications referred to elsewhere in the text.

Beginning with a survey for 1920, the Bureau of Agricultural Economics has conducted quinquennial surveys on which to base estimates of debt on farms operated by part-owners, tenants, and managers; the 1935, 1940, and 1945 surveys were conducted in cooperation with the Bureau of the Census. The results of the survey for 1925, which also collected data as of January 1, 1928, were published in *Farm-Mortgage Credit*, Tech. Bull. No. 288, February 1932, Department of Agriculture. The data for both 1930 and 1935 were published in the cooperative release *Farm Mortgage Indebtedness in the United States (Detailed Summary)*, August 26, 1937. When the data from both the 1940 census and the 1940 special survey became available, the 1935 estimates were revised, and the final estimates for 1930, 1935, and 1940 were presented in a cooperative release entitled *Farm-Mortgage Indebtedness in the United*

*States, Release No. 2—Amount of Farm-Mortgage Debt*, March 25, 1944. Mortgage data for 1935 are not published in any regular census volumes, except for those series that appear in the 1940 census reports. Likewise, the 1945 data are to be found only in the special cooperative report entitled *Farm-Mortgage Debt in the United States: 1945*, which also presents figures for 1930, 1935, and 1940. The revisions of the earlier census-year estimates on the basis of certain relationships established by more recent surveys were made so the estimates for all census years could be more comparable. A discussion of some of these revisions is included in the article "Fluctuations in Outstanding Farm-Mortgage Debt, 1910-39," appearing in the *Agricultural Finance Review*, vol. 2, No. 2, November 1939.

Estimates for intercensal years have been based on published data showing the amount of mortgages held by certain lending agencies and on estimates of the amount of farm mortgages recorded and released annually by other lender groups. Whenever a new census-year bench mark was established, the intercensal-year estimates were revised to reflect the new trend. For the years prior to 1935 the data on mortgages recorded and released were compiled from the records of selected counties through a Nation-wide WPA project sponsored by the Bureau of Agricultural Economics. Since 1935 this information has been collected by the Farm Credit Administration. Revisions of annual debt estimates back to 1930 appear in *Revised Annual Estimates of Farm-Mortgage Debt by States, 1930-43*, April 1944, and in *Distribution by Lender Groups of Farm-Mortgage and Real Estate Holdings, January 1, 1930-45*, August 1945, both reports of the Bureau of Agricultural Economics. Subsequent revisions back to 1940 are shown in the *Agricultural Finance Review*, vol. 10, November, 1947.

**E 244. Total farm-mortgage debt outstanding, 1910-1945.** SOURCE: See text for series E 244-251, above.

**E 245 and E 250. Farm-mortgage loans held by Federal land banks and Federal Farm Mortgage Corporation, 1918-1945.** SOURCE: See text for series E 244-251. Federal land banks, which were organized pursuant to the Federal Farm Loan Act of 1916, began operations in 1917 and gradually become important lenders in the farm-mortgage field, particularly after 1933. The data on loans closed and loans outstanding are from publications of the Farm Credit Administration or its predecessor, the Federal Farm Loan Board. Land Bank Commissioner loans, first made under the authority of the Emergency Farm-Mortgage Act of 1933, were taken over by the Federal Farm Mortgage Corporation upon its creation in 1934. The Commissioner continued to make such loans on behalf of the Corporation until his authority expired on July 1, 1947. The establishment and operations of these Federal lending agencies are examined rather fully in *Farm-Mortgage Credit Facilities in the United States*, Misc. Pub. No. 478, 1942, Department of Agriculture, as well as in the annual reports of the Farm Credit Administration.

**E 246. Farm-mortgage loans, held by life insurance companies, 1910-1945.** SOURCE: See text for series E 244-251. Life insurance companies invest considerable funds in farm mortgages and over the years have been a major source of mortgage loans. The figures presented here are estimates of the Bureau of Agricultural Economics based primarily upon data obtained from reports of companies holding a substantial proportion of all life insurance company loans. Prior to 1930 the estimates are based largely on data reported to the Association of Life Insurance Presidents. Since 1930 they are based upon direct reports from life insurance companies, official reports submitted to State insurance commissioners, hearings before the Temporary National Economic Committee, *Best's Life Insurance Reports*, and reports from the Life Insurance Association of America and the Institute of Life Insurance. The results of a study of the farm-mortgage investments of this lender group, particularly those of more recent years, are published in *Farm-Mortgage Investments of Life Insurance Companies*, De-

ember 1943, and in *Sales Contracts and Real Estate Investments of Life Insurance Companies*, March 1944, both reports of the Bureau of Agricultural Economics.

**E 247. Farm-mortgage loans, held by commercial banks, 1910-1945.** SOURCE: See text for series E 244-251. Commercial banks as a group also have loaned considerable funds on farm real estate. The data presented here do not cover all banks, but they do represent a very large proportion of all bank loans against farm real estate. Prior to 1935 they are for all open State and national banks, but since 1935 they include only the loans of insured commercial banks. Consequently, they do not include loans of noninsured commercial banks after 1934, closed commercial banks, nor mutual savings banks. Furthermore, they do not include sales contracts, which are usually classified with real estate by bank supervisory authorities. Data for insured banks are those reported by the Federal Deposit Insurance Corporation. Figures prior to 1935 are based on special surveys made by the Department of Agriculture in 1914, 1918, 1921, 1924, and 1931, the results of which are discussed in *Agricultural Loans of Commercial Banks*, Tech. Bull. No. 521, July 1936. Estimates for intervening years prior to 1935 were developed from data on mortgages recorded and released, which were collected from county records in the WPA project.

**E 248 and E 251. Farm-mortgage loans, held by joint-stock land banks, 1918-1945.** SOURCE: See text for series E 244-251. The joint-stock land banks, also authorized under the Federal Farm Loan Act of 1916, were under Federal supervision and regulation, but differed from the Federal land banks in that they were privately owned institutions. Their organization and growth are discussed in considerable detail in Schwartz, C. H., Jr., *Financial Study of the Joint-Stock Land Banks*, Washington College Press, Takoma Park, Md., 1938, as well as in the publications referred to in the text for series E 245 and E 250, above. Their liquidation was called for in the Emergency Farm-Mortgage Act of 1933, and since that time the only loans made by them have been in connection with liquidation activities. In the case of the several Federal and federally sponsored agencies, it should be pointed out that their "loans closed" include only their regular loans as distinct from purchase-money mortgages and sales contracts, and that they are not necessarily comparable with "loans recorded" by other lender groups.

**E 249. Farm-mortgage loans, held by "individuals and others," 1910-1945.** SOURCE: See text for series E 244-251. A substantial part of the total farm-mortgage loans is held by the lender group identified as "individuals and others." Within this group, individuals are by far the most important holders of farm mortgages. Because of its residual nature, this general lender group also includes many miscellaneous sources of farm-mortgage credit. These include mortgage, real estate, finance, and investment companies; State and local governmental agencies; religious, educational, civic, and fraternal organizations; mercantile firms dealing largely in farm supplies; lending agencies operating chiefly in the urban mortgage field but sometimes lending on farm lands; corporations and associations chiefly engaged in making production loans but sometimes requiring real estate as security; and, in more recent years, the Farmers Home Administration (formerly Farm Security Administration). In addition to these are the loans of mutual savings banks, closed commercial banks, noninsured commercial banks after 1934, insurance companies other than life insurance companies, and certain types of loans not specifically included in the figures for the major lending groups.

**E 252-255. Interest payable on farm mortgages, 1910-1945.** SOURCE: Bureau of Agricultural Economics and the Farm Credit Administration.

The interest rates given here represent average contract rates. They are averages of the rates charged by the various types of lenders weighted by the amount of mortgages recorded or held by each. Furthermore, they are averages of rates on all farm mortgages regardless of their priority. It should be pointed out that

year-to-year changes in the average rates do not necessarily reflect changes in the level of interest rates charged by the different lenders but may represent changes in the distribution among the lender groups of loans recorded or held. The averages are based on the rates specified in the mortgage contract and do not necessarily represent averages of the rates actually paid, except that in the case of rates on outstanding mortgages, they do reflect the temporarily reduced rates of the Federal land banks during the period 1934-44 and of the Federal Farm Mortgage Corporation during the period 1938-1945. The data on interest charges are estimates of amounts payable by borrowers during the calendar year and reflect the interest reductions granted borrowers by the Federal land banks during the years 1933-44 and the Federal Farm Mortgage Corporation during the years 1937-45. Furthermore, they are estimates of the amounts due during the calendar year, even though some of these amounts were not paid. The index of interest charges per acre is also shown, as this series is utilized in parity price computations.

Data on interest rates and interest charges representative of all types of owners and all types of lenders are available back to 1910. The Bureau of the Census obtained some information either on interest rates or interest charges on outstanding mortgages in 1890, 1920, 1930, and 1940. The interest rates on mortgages recorded (series E 252) have come from two sources. The averages shown for selected years after 1935 are estimates of the Farm Credit Administration based on mortgages recorded during the month of March in approximately one-third of the counties in the United States. The rates presented for 1935 and earlier are averages developed from data obtained in a Nation-wide WPA project sponsored by the Bureau of Agricultural Economics. The data for these earlier years appear in the publication *Average Rates of Interest Charged on Farm-Mortgage Recordings of Selected Lender Groups*, November 1940, Bureau of Agricultural Economics.

Average interest rates on outstanding mortgages (series E 253) for 1937 and later years are based on data obtained by the Bureau of Agricultural Economics in special surveys in census years and from Farm Credit Administration surveys of farm-mortgage recordings in selected months of intercensal years. For 1936 and earlier, the average rates are based on data obtained in the WPA project. Rates on mortgages recorded as reported in this project were converted to rates on outstanding mortgages by assuming that all mortgages recorded remained in effect for a period equal to the average of the terms of years specified in the mortgage contracts. This procedure was used for all lender groups, except the Federal land banks and Federal Farm Mortgage Corporation for which averages were computed from information on the amount of loans outstanding at various interest rates. A further discussion of the method used in developing this series appears in *Interest Charges Payable on Farm Indebtedness in the United States, 1910-40*, August 1942, Bureau of Agricultural Economics. Some of the data for the years after 1930 were later revised and were published in *Revised Annual Estimates of Interest Charges and Interest Rates on Farm-Mortgage Debt, 1930-43*, October 1944, Bureau of Agricultural Economics.

The series on the amount of interest charges payable (series E 254) was developed from the estimates of farm-mortgage debt outstanding at the beginning of each year and the average interest rates charged thereon, except in the case of the Federal agencies. Calendar-year estimates were computed by averaging the charges payable on debts outstanding at the beginning of each year with those payable on debts outstanding at the beginning of the succeeding year. For the Federal agencies, the actual amounts of interest charges payable on their outstanding loans during the calendar year were obtained from the Farm Credit Administration. These amounts, of course, excluded those charges no longer payable because of the interest reductions granted to borrowers. A more detailed discussion of the methods used appears in the pub-

lications referred to in the preceding paragraph. The interest charges per acre used in computing the index (series E 255) were arrived at by using Bureau of the Census acreage figures for census years with straight-line interpolations for intercensal years.

#### FARMER BANKRUPTCIES (E 256-257)

**E 256-257. Bankruptcy cases filed by farmers, 1899-1945.** SOURCE: For 1899-1938, see Department of Agriculture, *Farmer Bankruptcies, 1898-1935*, Cir. No. 414, September 1936, and Bureau of Agricultural Economics records; for 1939-1945, see Bureau of Agricultural Economics, *Agricultural Finance Review* issues.

The data presented show the number of bankruptcy cases "filed" or "concluded," for which the occupation given is that of farmer and the percentage that these are of the cases for all occupations. Since 1939 only data on cases "filed" have been available by occupations, whereas for 1939 and earlier years the data are for cases "concluded." The fact that not all cases filed are concluded may account for the apparent increase in number of cases between 1939 and 1940. Some cases are handled under sections of the National Bankruptcy Act which provide for settlement by compromise or by extension of farmers' debts. As such cases do not involve outright bankruptcy, they are not included in the figures shown.

Data on the number of farmer bankruptcy cases as an indicator of financial distress are subject to certain limitations. The Bankruptcy Act provides that farmers may not be placed in bankruptcy involuntarily, so that only those cases are covered in which the farmer chose this method of handling burdensome debts. In general, liquidation of indebtedness by means of foreclosure is the more common practice among farmers because of the large proportion of farmers' debts secured by physical assets.

The data on farmer bankruptcies have been summarized by the Bureau of Agricultural Economics from two sources. Since 1939 data on cases "filed" have been compiled from reports of the Administrative Office of the United States Courts and published in the *Agricultural Finance Review* of the Bureau of Agricultural Economics. For fiscal 1939 and earlier years, data on cases "concluded" were compiled from reports of the Department of Justice. Most of these earlier data were published in *Farmer Bankruptcies, 1898-1935*, Cir. No. 414, September 1936, Department of Agriculture.

#### FARMER NON-REAL-ESTATE CREDIT (E 258-266)

**E 258-266. Non-real-estate agricultural loans to farmers, 1910-1945.** SOURCE: Department of Agriculture. See specific sources mentioned below.

Non-real-estate credit, variously called short-term credit, personal and collateral credit, or production credit, is obtained by farmers from many sources including banks, Federal and federally sponsored credit agencies, merchants, dealers, commission men, finance companies, landlords, and other individuals. Commercial banks have provided the bulk of this type of credit extended by credit institutions although, since World War I, Federal and federally sponsored agencies and finance companies have become increasingly important in this lending field. The volume of non-real-estate credit extended by sources other than banks and Federal agencies is believed to have been as large as three billion dollars in 1920 and slightly over one billion dollars in recent years. Data that would permit precise estimates of the amount of this type of credit, however, are lacking.

Non-real-estate agricultural loan data of all commercial banks have been available for the years since 1939 from the Comptroller of the Currency. Similar loans of insured commercial banks, whose loans comprise about 97 percent of the loans of all banks, have

been regularly reported since 1937 by the Federal Deposit Insurance Corporation. For 1937 and earlier the only data available on the non-real-estate agricultural loans of commercial banks are those from Department of Agriculture surveys made in 1914, 1918, 1921, 1924, 1931, 1934, and 1936, of which all except the survey for 1936 are discussed in *Agricultural Loans of Commercial Banks*, Tech. Bull. No. 521, July 1936, Department of Agriculture. Upon the basis of these survey data and data on all loans of "country" national banks for intervening years, estimates have been made of the non-real-estate agricultural loans of all commercial banks back to 1910. For further details on this series, see the article "Short-Term Agricultural Loans of Commercial Banks, 1910-1945," in the *Agricultural Finance Review*, vol. 8, November 1945, Bureau of Agricultural Economics.

The Federal Government first entered the non-real-estate agricultural credit field in 1918 when five million dollars was made available for direct loans to farmers in the Northwest and Southwest where there had been two successive crop failures. During the 1920's seed and feed loans were made available from time to time in certain "distressed" areas by special Acts of Congress. In the early 1930's the basis for lending was broadened and the Emergency Crop and Feed Loan Office came to be a more-or-less permanent source of credit for farmers in distress. The Farmers Home Administration Act of 1946 transferred the activities of the Emergency Crop and Feed Loan Office from the Farm Credit Administration to the newly created Farmers Home Administration (successor to the Farm Security Administration) and provided for the liquidation of these loans. Henceforth, any loans of this character will be made by the Farmers Home Administration under the provisions of the new law. For a further discussion of the crop and feed loan program, see *Federal Seed-Loan Financing and Its Relation to Agricultural Rehabilitation and Land Use*, Tech. Bull. No. 539, October 1936, Department of Agriculture, as well as reports of the Farm Credit Administration.

The Agricultural Credits Act of 1923 created the Federal intermediate credit banks, the first permanent federally sponsored credit agencies making non-real-estate loans available to farmers. The intermediate credit banks make no loans directly to farmers, but they do make loans to and discount for private financing institutions (agricultural credit corporations and livestock loan companies). Such loans and discounts are indicative of the lending activity of these private financing institutions. Loans discounted by the Federal intermediate credit banks for the production credit associations since their organization in 1933 are not included in this series. A rather complete discussion of the Federal intermediate credit system appears in *Ten Years of Federal Intermediate Credits*, Baird and Benner, The Brookings Institution, Washington, D. C., 1933, as well as in reports of the Farm Credit Administration.

The Agricultural Credits Act of 1923, which authorized the creation of the Federal intermediate credit banks, also provided for loans to and discounts for agricultural cooperatives by these banks. These are in the nature of direct loans to marketing cooperatives on the security of commodities. These loans are also discussed more fully in *Ten Years of Federal Intermediate Credits*, and in reports of the Farm Credit Administration. In 1933 special legislation authorized the creation of the "banks for cooperatives," and by 1936 the function of the intermediate credit banks in making loans to cooperatives had largely been taken over by them. A large part of the loan funds of the "banks for cooperatives," however, is supplied by the Federal intermediate credit banks. During the early 1930's considerable funds were made available to agricultural cooperatives through the Agricultural Marketing Act revolving fund, but with the growth of the "banks for cooperatives," this fund has become a relatively unimportant source. Data on its loans are not included here, nor are those of the Rural Electrifi-

cation Administration, the Farmers Home Administration (successor to Farm Security Administration), the Commodity Credit Corporation, or the production credit associations.

DEPOSITS OF COUNTRY BANKS (E 267-269)

E 267-269. Indexes of deposits of country banks, 1923-1945.

SOURCE: Department of Agriculture. For 1923-1943, see *Agricul-*

*tural Finance Review*, "Indexes of Deposits of Country Banks," vol. 7, November 1944; for 1944-1945, see *Agricultural Finance Review*, vol. 9, November 1946. The indexes for demand, time, and total deposits are based upon deposits of member banks of the Federal Reserve System, located in places of less than 15,000 population in the 20 leading agricultural States. For an analysis of these series see *Demand Deposits of Country Banks*, Tech. Bull. No. 575, August 1937, Department of Agriculture.

Series E 1-5.—GENERAL STATISTICS—FARM REAL ESTATE, NUMBER OF FARMS AND VALUE: 1850 TO 1945

[Census years are in italics]

YEAR	Number of farms	Total value, selected items of farm property <sup>1</sup>	FARM LAND AND BUILDINGS		Index of estimated value of farms per acre (1912-14=100)	YEAR	Number of farms	Total value, selected items of farm property <sup>1</sup>	FARM LAND AND BUILDINGS		Index of estimated value of farms per acre (1912-14=100)

<sup>1</sup> Including contracts to purchase (but not options).  
<sup>2</sup> Including loss of title by default of contract, sales to avoid foreclosures, and surrender of title or other transfers to avoid foreclosure.

<sup>3</sup> Includes inheritance and gift transfers; administrators', executors', and other sales in settlement of estates; and miscellaneous and unclassified sales.  
<sup>4</sup> For differences between these series and series E 7 and E 9, respectively, see descriptive text for series E 6-11.

Series E 19-30.—GENERAL STATISTICS—FARM TENURE, NUMBERS OF FARMS BY TENURE: 1880 TO 1945

YEAR	NUMBER OF FARMS BY TENURE OF OPERATOR						PERCENT OF TENANTS AMONG FARM OPERATORS, BY AGE OF TENANT <sup>1</sup>					
	Total farms	Full-owner farms	Part-owner farms	Manager farms	Tenant farms		Under 25 years	25 to 34 years	35 to 44 years	45 to 54 years	55 to 64 years	65 and over
					Number	Percent of total farms						
	19	20	21	22	23	24	25	26	27	28	29	30

1866 <sup>9</sup>				53	10.09	15.50	0.64	0.90			

<sup>1</sup> These annual averages are simple averages of 1st-of-month employment estimates.

<sup>2</sup> Includes farm operators and members of their families doing farm work without wages.

<sup>3</sup> Annual averages are weighted averages of wage rates as reported quarterly by crop reporters.

<sup>4</sup> Cash wages and value of perquisites.

<sup>5</sup> Index of volume of farm production for sale and consumption in farm households divided by the index of average annual farm employment.

<sup>6</sup> Index of volume of gross farm production divided by the index of average annual farm employment. Gross farm production includes as production the "constant" dollar value of the crops fed to farm horses and mules and of the labor and other resources used in the raising and maintenance of horses and mules. For further discussion of differences in the two production series see text for series E 72-73.

<sup>7</sup> Preliminary.

<sup>8</sup> 1877 or 1878, 1878 or 1879 (combined).

<sup>9</sup> Years 1866 to 1878 in gold.

Series E 72-75.—GENERAL STATISTICS—PRODUCTION MEASURES, VOLUME OF AGRICULTURE PRODUCTION AND AGGREGATE ACREAGE OF 52 CROPS: 1909 TO 1945

YEAR	INDEXES OF VOLUME OF PRODUCTION (1935-39 = 100)		AGGREGATE ACREAGE, 52 CROPS		YEAR	INDEXES OF VOLUME OF PRODUCTION (1935-39 = 100)		Aggregate acreage harvested, 52 crops
	Production for sale and home consumption <sup>1</sup>	Gross farm production <sup>2</sup>	Planted or grown	Harvested		Production for sale and home consumption <sup>1</sup>	Gross farm production <sup>2</sup>

1927	98	100		348,244				

<sup>1</sup> Includes total volume of all livestock and livestock products (exclusive of horses and mules) sales and home consumption during the calendar year, and total volume of crop production, minus quantities retained for feed or seed and quantities not harvested or lost. No adjustments are made for inventory changes in estimating the volume of livestock sales.

<sup>2</sup> Includes total volume of calendar-year production of all crops, pasture consumed by all livestock and the product added in the conversion of feed and pasture into livestock and livestock products for human use and into farm-produced horse and mule power.

Series E 76-87.—GENERAL STATISTICS—FARM TAXES AND INSURANCE: 1890 TO 1945

<sup>1</sup> For 1914-33 includes companies with more than 65 percent of their insurance on farm property. For later years includes companies with more than 50 percent of their insurance on farm property. About 88 percent of their total insurance is on farm property.

<sup>2</sup> Number of companies for which data were obtained; perhaps not entirely complete for any year.

<sup>3</sup> Excess of assets over liabilities. Most of the farmers' mutuals are assessment companies and as such are not required to set up unearned premium reserves. Data not compiled prior to 1935.

<sup>4</sup> Preliminary.

<sup>5</sup> Less than \$500,000.

Series E 88-104.—GENERAL STATISTICS—FARM INCOME, PRICES RECEIVED AND PAID: 1910 TO 1945

YEAR	CASH RECEIPTS FROM FARM MARKETINGS (MILLIONS OF DOLLARS)			FARM INCOME <sup>1</sup> (MILLIONS OF DOLLARS)				INDEX NUMBERS OF PRICES RECEIVED AND PAID BY FARMERS, TAXES, ETC. (BASE: 1910-14=100)										Parity ratio <sup>7</sup>

<sup>1</sup> Includes government payments from 1933 to 1945.

<sup>2</sup> Includes cash receipts from farm marketings, government payments 1933 to date, value of home consumption, and rental value of farm dwellings.

<sup>3</sup> Data beginning 1940 not completely comparable to earlier years, because of certain adjustments which have not been published.

<sup>4</sup> Gross farm income minus total farm production expenses.

<sup>5</sup> Realized net income of farm operators plus value of inventory change plus wages paid to farm laborers living on farms.

<sup>6</sup> Base: August 1909-July 1914=100.

<sup>7</sup> Ratio of prices received by farmers (series E 95) to prices paid, including interest and taxes (series E 103).

## Series E 105-116.—GENERAL STATISTICS—FARM MACHINERY AND EQUIPMENT AND FERTILIZER CONSUMPTION: 1850 TO 1945

<sup>1</sup> Includes sales to plants and dealers and retail deliveries by farmers direct to consumers.

<sup>2</sup> Includes all cheese except cottage, pot, and bakers'.

<sup>3</sup> From 1919 to date includes evaporated milk, bulk unsweetened condensed whole milk, and sweetened condensed whole milk, both case and bulk, as compiled by the Bureau of Agricultural Economics. Prior to 1919, includes total production of all condensed and evaporated milk as obtained in Census enumerations.

<sup>4</sup> Prior to 1909 merely an estimated trend of production.

<sup>5</sup> Computed from manufactured products on basis of the following conversion factors: Butter, 21; cheese, 10; evaporated and condensed milk, 2.2; ice cream, 12; malted milk, 2.6; dry whole milk, 8; dry cream, 19. Includes milk equivalent of farm butter and farm cheese.

<sup>6</sup> Conversion factors based on fat in product and average butterfat test of milk in each State. For butter and ice cream, net milk equivalents were used to avoid double counting of fat recovered from cheese making and churned into butter, and of fat in condensed milk and butter reused in making ice cream. Includes milk equivalent of farm butter.

<sup>7</sup> Interpolated trend of production.

<sup>1</sup> Estimates of the commercial crop refer to the production in the commercial apple areas of each State and include fruit produced for sale to commercial processors as well as for sale for fresh consumption.

<sup>2</sup> Includes tangerines.

<sup>3</sup> Relates to crop from the bloom of the year shown. In California the picking season usually extends from Oct. 1 to Dec. 31 for oranges, and Oct. 1 to Sept. 30 of the following year for grapefruit. In other States the season begins about Oct. 1 and ends in early summer.

<sup>4</sup> Prices are the equivalent per unit returns at the intake packing house door for all methods of sale.

Series E 244-255.—FARM CREDIT—FARM-MORTGAGE DEBT, LOANS, INTEREST: 1910 TO 1945

[Loans held by FFMC (Federal Farm Mortgage Corporation) are those made by Land Bank Commissioner. Land Bank Commissioner loans first made in 1933; in 1934 and thereafter made on behalf of FFMC. Joint-stock land banks have been in liquidation since May 12, 1933; includes banks in receivership]

<sup>1</sup> Beginning 1930, includes purchase-money mortgages and sales contracts in addition to regular mortgages.

<sup>2</sup> For 1935-45 includes insured commercial banks; prior to 1935, all open State and national banks.

<sup>3</sup> Average contract rates, except for temporarily reduced rates on outstanding loans of Federal land banks, 1934-44, and Federal Farm Mortgage Corporation, 1938-45.

<sup>4</sup> Payable during calendar year on outstanding loans. Excludes amounts paid by Secretary of the Treasury to Federal land banks, 1933-44, and Federal Farm Mortgage Corporation, 1937-45, as reimbursement for interest reductions granted borrowers.

<sup>5</sup> Average of rates on mortgages recorded during month of March only.

<sup>6</sup> Less than \$500.

<sup>7</sup> Data not available.

<sup>8</sup> Partially estimated.

Series E 256-257.—FARM CREDIT—BANKRUPTCY CASES FILED BY FARMERS: 1899 TO 1945

[Figures for 1940 to 1945 are for cases filed; for earlier years, cases concluded. Data are for years ending June 30]

<sup>1</sup> All active banks. Includes loans guaranteed by Commodity Credit Corporation.  
<sup>2</sup> Seed, feed, and crop production loans; also includes drought-relief loans made in 1934-35 and orchard rehabilitation loans made in 1942-44.  
<sup>3</sup> Excludes loans to production credit associations.  
<sup>4</sup> Includes renewals.  
<sup>5</sup> Federal Reserve member banks in places of less than 15,000 population in the following States: Ark., Ga., Ill., Ind., Iowa, Kansas, Mich., Minn., Miss., Mo., Nebr., N.Y., N.C., N. Dak., Ohio, Okla., Pa., S. Dak., Texas, and Wis.

<sup>6</sup> Includes loans guaranteed by Commodity Credit Corporation.  
<sup>7</sup> Average of 7 months.  
<sup>8</sup> Average of 11 months.  
<sup>9</sup> As of July 1.  
<sup>10</sup> Excludes loans made in 1918-19. The amount of these loans outstanding as of July 1, 1925, was \$1,052,450.  
<sup>11</sup> Average of 9 months.

## Chapter F. Land, Forestry, and Fisheries (Series F 1-219)

### Public Lands of the United States: Series F 1-24

#### ACQUISITION (F 1-7)

**F 1-7. Acquisition and extent of territory and public domain, 1781-1945.** SOURCE: See detailed listing below.

**F 1-3. Acquisition of the territory of the United States, 1783-1945.** SOURCE: *Areas of Acquisitions to the Territory of the United States . . .*, Department of Interior, Office of the Secretary, Washington, Government Printing Office, 1922. All areas are given as computed in 1912 by a Federal Government committee representing the General Land Office and the Geological Survey (Department of the Interior) and the Bureau of Statistics and the Bureau of the Census (then in the Department of Commerce and Labor). Figures shown here have not been adjusted for the new area measurements for the United States which were made for the 1940 Decennial Census. For the revised figures in square miles, see series B 26-28. The new measurements resulted in a decrease of 4,402 square miles in the gross area (land and water combined), and in an increase of 3,352 square miles in the land area. (See Bureau of the Census, Sixteenth Census Reports, *Areas of the United States, 1940, 1942*, p. 3.)

Recognition of its sovereignty over its present continental land-area of 2,977,128 square miles, or about 1,905 million acres (as recomputed for the 1940 Decennial Census), was acquired by the United States Government through a series of international agreements and treaties. The United States, however, did not gain title to all of these lands by such agreements. At the time of acquisition of sovereignty over the areas involved, title to about 463 million acres rested in individual States and their political subdivisions or in private owners, which title was not relinquished to the United States. Title to the remaining 1,442 million acres passed to the United States Government during the period from 1781 to 1853.

**F 4-6. Acquisition of the original public domain, 1781-1945.** SOURCE: Same as series F 1-3, above. For area by States, see Department of the Interior, "Statistical Appendix" (p. 4) of the *Annual Report of the Commissioner of the General Land Office, 1946*.

By acts of cession during the period from 1781 to 1802 seven of the Original Thirteen States relinquished to the United States Government for the common good their claims to the "western lands," roughly the area north of the Ohio River and east of the Mississippi River and the area embraced by the present States of Alabama and Mississippi. The State of Maryland ceded the present area of the District of Columbia in 1788. In 1850 the State of Texas sold its lands outside its present boundaries to the United States. Title to the remaining area west of the Mississippi River (except the State of Texas) and to Florida passed to the United States Government as sovereign at the time of their addition to the Nation during the period from 1803 to 1853. For detailed information, see Douglas, E. M., *Boundaries, Areas, Geographic Centers and Altitudes of the United States and the Several States . . .* Department of the Interior, Geological Survey Bulletin 817, 1939 edition, and Hibbard, B. H., *A History of the Public Land Policies*, MacMillan Co., N. Y. 1924.

With the exception of lands in the District of Columbia, the total of 1,442 million acres of land area (see series F 5), title to which became vested in the Government, is known as the *original public domain*. Any of such lands which the Government has not disposed of under the public-land laws, are generally referred to as *public-domain lands*.

In addition to the public domain, the United States Government has from time to time acquired by purchase, condemnation, and

gift, tracts of land needed for various public purposes, such as sites for public buildings, defense installations, and natural-resource conservation activities. Such lands are often referred to as *acquired lands*, to distinguish them from public-domain lands. Complete statistics are not available as to the extent of such acquisitions.

**F 7. Estimated area of the public domain, 1802-1946.** SOURCE: Bureau of Land Management, Department of the Interior. Data are estimates based on imperfect data for the years indicated. For definition of public domain, see text for series F 4-6.

#### PUBLIC LANDS AND THE NATIONAL PARK SYSTEM (F 8-24)

**F 8-16, F 19-24. General note.** These series on disposal of public lands, 1800-1945, were provided by the Bureau of Land Management, Department of the Interior, except as otherwise noted. For definition of public-domain lands and acquired lands, see text for series F 4-6. The laws which govern the management, use, and sale or other disposal of public-domain lands are known as the *public-land laws*. The earlier concept with respect to the public domain was to pass the public lands into private ownership as rapidly as possible. Initially to raise revenue and later to hasten the settlement and development of the country, the Congress passed thousands of laws providing for the disposal of the original public domain to States and their subdivisions and to private owners. Under these laws, approximately 285 million acres have been patented to homesteaders, 225 million acres have been granted to States for various public purposes and 90 million acres to railroad corporations to aid in financing the construction of railroads, and about 430 million acres have been sold or otherwise disposed of. Disposals have reduced the original public domain to its present area of about 413 million acres (see series F 7). Special laws provide for the disposal of surplus *acquired lands*, as, for example, the Surplus Property Act of 1944.

**F 8. Vacant public lands, 1904-1945.** SOURCE: *Annual Report of the Commissioner of the General Land Office, 1904-1945*. The data were compiled by the Bureau of Land Management, Department of the Interior, and are to be considered as estimates. These data do not include public lands in Alaska.

The vacant public lands of the United States are public-domain lands (see text for series F 4-6) which are not reserved for any purpose other than for reclassification and which are not covered by any non-Federal right or claim other than permits, leases, rights-of-way, or unreported mining claims. They are subject to acquisition by applicants under appropriate laws, such as the laws governing homesteads or grants to States. It is upon these laws for the most part that entries and selections (see text for series F 11-13) are made. The Bureau of Land Management, Department of the Interior, administers the public-land laws relating to such entries and selections, a function transferred to it from the General Land Office as a part of Reorganization Plan No. 3 of 1946.

**F 9. Cash receipts of the General Land Office from the disposal of public and ceded Indian lands and resources, 1881-1945.** SOURCE: *Annual Report of the Commissioner of the General Land Office, 1946*, "Statistical Appendix," pp. 120-121. Figures are for fiscal years. These data represent the total receipts of the General Land Office covered into the Treasury during the period from 1881 through 1945 and include the relatively small receipts from land and resources in Alaska. They do not include the receipts which other Government agencies realized from their operations on Federal lands, although they do include some receipts from lands under the administration of such agencies. For example, mineral leases

for public-domain lands within national forests were issued by the General Land Office, which also collected the mineral rentals, royalties, and bonuses from such lands. Also, during the fiscal years 1935 through part of 1940 the General Land Office collected grazing fees for lands within grazing districts and during the fiscal years of 1908 through the first half of 1913 collected water-right charges in connection with the Bureau of Reclamation irrigation projects. Other examples of multiple jurisdiction exist.

For receipts from sales of public lands as reported by the Treasury Department, see chapter P, series P 94. The data representing receipts from sales of public lands which are included within series F 9, however, are not identical to those shown for series P 94, since the General Land Office reports of receipts from sales did not cover the same period as the Treasury reports.

**F 10. Area of land granted by the United States to the several States for public purposes, 1802-1938.** SOURCE: *Annual Report of the Commissioner of the General Land Office*, 1946, "Statistical Appendix," pp. 108-119; see also *General Land Office Information Bulletin No. 1, 1939 series*. The data on land grants to the States for various public purposes are presented according to the calendar year in which the granting legislation was passed by the Congress. Some variation in the series is possible since the language of some of the statutes, including that of amendatory legislation, offers alternatives in the selection of the year to which individual grants could be assigned. As with the land grants for the construction of canals and other transportation improvements (series F 20-24), many of these grants were satisfied through delivery of evidence of legal title over the years. On June 30, 1946, this process of adjudication had not yet been completed for all of the grants and small changes in the data shown will occur. The data are estimated in part and apparently include a small amount of duplication of information given in series F 20.

**F 11-13. Area of original entries and selections, final entries, and patents and certifications, 1869-1945.** SOURCE: For 1920-1945, see Department of the Interior, *Annual Report of the Commissioner of the General Land Office*; for 1869-1919, see annual volumes, *Statistical Abstract of the United States*, 1879-1919. Figures for 1903 to 1908 are revised as shown in the *Statistical Abstract*, 1909.

The data on entries, selections, patents, and certifications refer to transactions which involve the disposal, under the public-land laws (including the homestead laws) of Federal public-domain lands to non-Federal owners. In general terms, *original entries and selections* are applications to secure title to public-domain lands which have been accepted as properly filed. Some types of applications, however, are not reported until the final certificate is issued (see below) and are, therefore, not included in series F 11.

Applications become *final entries* upon issuance of a *final certificate* which is given to the applicant after he has complied fully with the requirements of the laws relating to his application. These requirements may include, in particular cases, settlement upon and improvement of the lands entered, or payment of statutory fees or purchase money. A *final certificate* passes equitable title to the land to the applicant. With respect to certain State selections (see below), no final certificate is issued. Such selections are, therefore, not included in series F 12 (final entries). *Patents* are instruments which pass legal title to the lands to the applicant. *Certifications* are issued in lieu of patents in connection with certain State selections.

The data do not include the area of certain lands which have been granted to the States to aid in the support of common schools. Title to such lands usually passes to the States upon survey of the lands by the Federal Government. Owing to legal complexities, detailed statistical records were not kept of these lands. The statistics herein published have been subjected to minor adjustments to improve comparability. They have not been checked, however, for internal accuracy or for strict comparability which would re-

quire analysis of supporting records. Data include disposals of lands in Alaska.

**F 14-16. Homestead entries, except on ceded Indian lands, 1863-1945.** SOURCE: Series F 14: For 1884-1945, see Department of the Interior, *Annual Report of the Commissioner of the General Land Office*, 1884-1946; for 1863-1883, see Donaldson, Thomas, *The Public Domain*, Government Printing Office, Washington, D. C., 1884, pp. 351-355. Series F 15: Annual volumes, *Statistical Abstract of the United States*, 1889-1946. Series F 16: For 1868-1928, see *Statistical Abstract*, 1929, p. 130; for 1929-1945, see *Statistical Abstract*, 1946, p. 162. For definitions of the terms *original entries* and *final entries*, see text for series F 11-13.

The data on the number of original homestead entries do not include the number of applications which were accepted for lands that had been ceded by the Indians to the United States with the provision that proceeds from their disposal would be covered into the Treasury to the credit of the Indians. Detailed statistics on such homestead entries were not published in the reports of the Commissioner of the General Land Office prior to 1924. Such reports contain general information as to the disposal of ceded Indian lands. The records upon which the reports were based are for the most part on file in the National Archives.

The data on acreage of final entries (series F 16) do not include commuted homesteads. A *commuted homestead entry* is a homestead entry not exceeding 160 acres in connection with which the entryman pays the minimum statutory price for the land in consideration for reduction in residence and other requirements. Only certain classes of homestead entries can be commuted.

**F 17-18. National Park System, 1916-1945.** SOURCE: See detailed listing below.

**F 17. Area of Federally owned lands administered by National Park Service, 1916-1945.** SOURCE: Department of the Interior, *Annual Report of the Director of the National Park Service*, 1916-1946. These data include public-domain and acquired lands (see text for series F 4-6). In 1946, the area included 25 national parks, 4 national historical parks, 82 national monuments, 11 national military parks, 1 national battlefield park, 7 national battlefield sites, 10 national historic sites, 9 national memorials, 10 national cemeteries, 3 national parkways, 1 national historical park project, 1 national battlefield park project, 4 recreational areas, and the National Capital Parks. These data do not include national parks and monuments in Alaska and Hawaii which, in 1916, comprised 75,000 acres; in 1946, 7,108,000 acres.

**F 18. Visitors to National Park System per travel year, 1916-1945.** SOURCE: Records of National Park Service. Figures on number of visitors are estimated in part and do not include visitors to national parks and monuments in Alaska and Hawaii which, in 1921, comprised 16,000 and in 1946, 433,000 persons. *Travel year* refers to period, October 1 to September 30.

**F 19. Public land sales, 1800-1860.** SOURCE: Smith, Walter Buckingham, and Cole, Arthur Harrison, *Fluctuations in American Business, 1790-1860*, Harvard University Press, Cambridge, 1935. Data were derived from Hibbard, *A History of the Public Land Policies* (1924), pp. 100, 103, 106, and from *Annual Reports of the Commissioner of the General Land Office*. The data differ from those presented by Hibbard (p. 106) for the years after 1850. After 1850, Hibbard's data shift from calendar years to fiscal years ending June 30.

**F 20-24. Area of lands granted by the United States to aid in the construction of railroads, wagon roads, canals, and river improvements, 1823-1871.** SOURCE: Department of the Interior, *Annual Report of the Commissioner of the General Land Office*, 1946, "Statistical Appendix," pp. 100-107, and *Statement Showing Land Grants Made by Congress*, 1915.

The data on land grants which were made to aid in the construction of canals, railroads, river improvements, and wagon roads include only the area of lands for which title passed to the grantee States and corporations. The exact extent of practically all

of these grants was, owing to their terms, indeterminate at the time the granting acts were passed by the Congress. The procedures for the satisfaction of the grants generally required the grantees to submit lists of lands, evidence of legal title to which they requested on the basis of the provisions of the authorizing legislation. This process of issuance of instruments of title has not yet been fully completed by the Department of the Interior but a relatively small area remains to be adjudicated.

For the series presented, the areas shown in the instruments of title which were issued for each grant over the years were totaled and shown as of the fiscal year in which the grant was *originally enacted* even though in certain instances grants were revived at a later date after the expiration of statutory time limits, while others were enlarged by subsequent legislation. Because the tabulation is based on instruments of title, the data do not reflect the area of those portions of grants which could not be satisfied under the law for various reasons or of those grants or portions of grants which were forfeited.

### Land Utilization: Series F 25-68

**F 25-36. Land and water area, by type, 1850-1945. SOURCES:** Figures for total area and total farm land are based on figures in square miles from the Bureau of the Census. For total figures (gross, land, and water) in square miles, 1790-1945, see series B 26-28. Data on utilization of farm land, 1850-1925, are mostly Bureau of Agricultural Economics estimates based on the Census of Agriculture conducted by the Bureau of the Census. Those for 1930-1945 are from the Census of Agriculture. All data for total nonfarm land are from the Census Bureau. Figures for utilization of nonfarm land are estimated by Bureau of Agricultural Economics from records and reports of State and Federal agencies concerned with management of public land, conservation of land, public services, and assessment of land for taxation.

Collection of land utilization statistics began with the Census of 1850, when farm land was enumerated as "improved land" or "unimproved land." In 1890 and in later census years these inquiries were expanded and revised. After the turn of the century collection of various land utilization statistics was begun by branches of the Department of Agriculture, while other contributions to the literature on this subject were made by numerous agencies, State universities, and individuals.

Major emphasis has been upon the collection of statistics concerning crops—acreage and kind. The Census of Agriculture has been the primary source of data concerning land in farms in census years. Statistics concerning land not in farms have been less complete, with the exception of forest land, and have included studies of individual items by interested agencies, such as forest land acreage by the Forest Service, public-domain lands by the Department of the Interior, etc., and studies of local areas by Federal, State, and private agencies and individuals. During the 1930's studies by the National Resources Planning Board and assisting agencies contributed greatly to the available statistics on total land utilization. Since 1920 the Bureau of Agricultural Economics has prepared periodic inventories of land use.

Data for 1940 and 1945 are the results of the remeasurement of the United States made for the 1940 Decennial Census. The last previous measurement was that for the Census of 1880. Differences are due primarily to the more accurate determination of the outer limits of the United States, the improvement in mapping, and omission of certain bodies of water included in the previous measurements. See *Areas of the United States, 1940*, Sixteenth Census of the United States, 1940, Department of Commerce, Bureau of the Census, 1942, pp. 1-5. For a summary of the development of the science of measuring geographic area, giving particular emphasis to work done in the United States, see Proudfoot, Malcolm J., *Measurement of Geographic Area*, U. S. Bureau of the Census, Washington, D. C., 1946.

Changes in total farm land in the period of record in part represent increased agricultural activity and in part more complete census enumeration and changes in census definition of *land in farms*. Uses not reported by the Census Bureau and additions to census data for the years following 1925 are based largely on agricultural statistics assembled by the Department of Agriculture. Forest land inventories and grazing land studies during this period are believed to have improved the reliability of the estimates of these items for this period as contrasted with earlier years. Estimates for 1924 and prior census years for land not in farms are based on more limited evidence, such as available charts, maps, records, and reports on land areas and uses.

**F 25-27. Total area, 1850-1945. SOURCE:** See text for series F 25-36, above. Definitions: *Total land area*, as defined by the Census for the 1940 remeasurement includes "dry land and land temporarily or partially covered by water, such as marshland, swamps and river flood plains . . ." (except tidal flats) ". . . streams, sloughs, estuaries, and canals less than  $\frac{1}{2}$  of a statute mile in width; and lakes, reservoirs, and ponds having less than 40 acres of area." *Inland water areas*, as defined by the Census for the 1940 remeasurement, includes the "permanent inland water surface, such as lakes, reservoirs, and ponds having 40 acres or more of area; streams, sloughs, estuaries, and canals  $\frac{1}{2}$  of a statute mile or more in width; deeply indented embayments and sounds and other coastal water behind or sheltered by headlands or islands separated by less than 1 nautical mile of water; and islands having less than 40 acres of area."

**F 28-32. Farm land, 1850-1945. SOURCE:** See text for series F 25-36, above. Definitions: *Cropland* includes cropland harvested, crop failure, and cropland idle or fallow. *Farm pasture* includes nonforested pasture and grazing land, whether plowable or not plowable. *Farm woodland* as defined by the Census, includes grazed or ungrazed "farm wood lots or timber tracts, natural or planted, and cut-over land with young growth, which has or will have value as wood or timber. Chaparral and woody shrubs were to be omitted." *Other land in farms* includes farmsteads, roads, lanes, wasteland, etc.

**F 33-36. Nonfarm land, 1850-1945. SOURCE:** See text for series F 25-36, above. Definitions: *Nonfarm grazing land* includes nonfarm pasture and rangeland, arid woodland and other noncommercial forest land. *Nonfarm forest land* includes nonfarm timber land capable of producing timber of commercial quantity and quality. *Other nonfarm land* includes urban areas, highways and roads, railroad rights-of-way, parks, game refuges, airports, and other similar "service areas." Also included are lands having slight use value, such as desert, rock, sand dunes, etc.

**F 37-51. Public and private land ownership by major uses, 1920-1945. SOURCES:** Compiled by the Bureau of Agricultural Economics from a number of Federal and State reports and records. Varying degrees of reliability attach to these figures. The figures used here are applicable for different dates, and all of them have been assembled for some other purpose than that for which they are used here. The areas of all unsurveyed lands are estimated, and the areas of many based on surveys are subject to correction. Some of the data are not complete and are used merely for comparison. Therefore, the figures given here, while the best now available, are not strictly accurate, often not complete, and are not comparable among themselves. Nevertheless, they give some notion of the major features of land use and control for the country as a whole.

See text for series F 25-36 for definitions and for longer series on total land area. *Public land* as used here is land owned or administered by Federal, State, county, municipal, or other governments for common or public purposes. Public land usually includes Indian lands held in trust and administered for the benefit of groups or tribes of the Indian people. Public land frequently is used by private parties under a system of permits or leases. Sometimes the public land, where it is used by individual users, is in-

cluded in reporting statistics on acreages in farms. More often, the public land is reported as not in farms, where it is used in common by several persons. *Private land* is land held or owned by private individuals, groups, and corporations, and is generally used for private purposes.

**F 52-61. Drainage and irrigation, 1890-1940.** SOURCES: Bureau of the Census, *Drainage of Agricultural Lands*, 1940, table 1, p. 1; *Irrigation of Agricultural Lands*, 1940, tables 2 and 3, pp. 2-3; *Census of Agriculture*, 1935 and 1940. Statistics relating to irrigation were first collected by the Bureau of the Census in 16 Western States in 1890 and published in a report, *Agriculture by Irrigation in the Western Part of the United States*. Information on irrigation was obtained by the Census in 1900 for the same 16 States and was included in the State reports of the Census of Agriculture. A special census of irrigation was taken in 1902 and the statistics were published in *Bulletin 16* of the Census Bureau in 1904. An irrigation census was taken in the years of 1910, 1920, 1930, and 1940, and the data were published for each irrigation census as a separate report. The acreage of irrigated cropland harvested was obtained in the Census of Agriculture in 1935 and published in the agriculture reports for that year.

The first drainage census in the United States was taken in 1920, the second in 1930, and the latest in 1940, together with the Census of Agriculture. The 1940 census of drainage covered 38 States, including all States where organized public drainage enterprises were major factors in drainage. Data were collected on areas of land and its use, the type of drainage, the total public investment, and the character of enterprise. The date of each drainage census was January 1 of the census year. The data on condition and use of the land was for the year preceding the date of the census.

Although both types of reclamation have been and are important, drainage development overshadows irrigation in acreage of land already converted to farming and in land that still may be developed. Drainage developments are concentrated mostly in the humid zones of the Eastern and Central States, whereas irrigation developments are located predominantly in the arid and semiarid zones of the West. However, in irrigated areas, drainage also must be provided to carry away any water not required by the crops.

The States included for series F 56-59 are: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Kansas, Nebraska, North Dakota, South Dakota, Oklahoma, Texas, Arkansas, and Louisiana. For series F 60-61, the States included are: Alabama, Florida, Georgia, Mississippi, South Carolina, Kentucky, Tennessee, North Carolina, Virginia, Ohio, Indiana, Illinois, Iowa, Michigan, Missouri, Minnesota, Wisconsin, Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, Pennsylvania, New Jersey, Delaware, Maryland, and West Virginia.

**F 62-68. Agricultural land utilization program, Soil Conservation Service and antecedent agencies, 1935-1945.** SOURCES: Department of Agriculture, *Agricultural Statistics*, 1939 to 1946, and *Report of the Chief of the Soil Conservation Service*, 1943 to 1946.

**F 62. Total area managed, 1935-1945.** SOURCE: See text for series F 62-68, above. Includes lands under the direct control of the Soil Conservation Service and that managed through local agencies, such as soil conservation districts, grazing districts, and grazing associations. Certain areas wherein Soil Conservation Service retains only custodial responsibility for managements and protection are not included but are reported separately. For the years 1935-38, "total area managed" represents lands acquired less land transferred.

**F 68. Areas transferred to State agencies with Soil Conservation Service maintaining custodial responsibility, 1935-1945.** SOURCE: See text for series F 62-68, above. Includes lands transferred to State agencies by agreement whereby the United States retains title to the land and the SCS acts as custodian. Other areas have been transferred to State agencies with custodial responsibility

resting in other Federal agencies, such as the United States Forest Service and the Fish and Wildlife Service.

The agricultural land-utilization program was initiated in 1934 under the Land Policy Section of AAA and was continued under the Resettlement Administration and the Farm Security Administration. Acquisition, development, and management functions provided for by Title III of the Bankhead-Jones Farm Tenant Act (Pub. No. 210, 75th Congress, 1st session, Ch. 517) were transferred to the Soil Conservation Service in 1938.

Acquisition of land totaled about 179,000 acres under the AAA; about 8½ million acres under the RA and FSA; and 2½ million acres more or less under the Soil Conservation Service—a total of about 11½ million acres, of which more than 4 million acres have been transferred to other Federal and State agencies for administration. The lands transferred include: Forest lands transferred as additions to the national forests; wildlife refuges; State parks; military areas; and other public-use areas.

### Forestry: Series F 69-154

**F 69-73. National forest areas and purchases, 1905-1945.** SOURCE: Department of Agriculture, Forest Service annual reports on national forest areas and annual reports of the National Forest Reservation Commission. *National forest areas* include areas within national forests and areas within purchase units, experimental forests, land utilization projects, and small administrative sites outside of national forests. *National forest purchases* show the acreage authorized for purchase by the United States for national forest purposes. *Gross area within established boundaries* refers to the total acreage within the established boundaries of the national forests and other units mentioned above. *Part of gross area under Forest Service Administration* refers to the part of the total area within the national forest and other unit boundaries that is owned by the United States or being acquired by it and actually under the administration of the Forest Service; the difference between these data and the gross area data is the part in private, State, or other ownership.

**F 74-87. National forest grazing, roads and trails, and visitors; forest trees planted on farm lands, 1905-1945.** SOURCE: Department of Agriculture, Forest Service records and annual reports, and *Agricultural Statistics*.

**F 88-102. National forest timber cut and receipts, 1905-1945.** SOURCE: Department of Agriculture, Forest Service records and annual reports, and *Agricultural Statistics*.

**F 103-108. Payments to States and Territories, and allotments to Forest Service, 1906-1945.** SOURCE: Forest Service records and annual reports. Payments to States and Territories are from receipts of the previous year. Allotments to Forest Service are for expenditure in States and Territories for acquisition of land and for road and trail work, and are based on receipts from timber, grazing, and other uses.

The *25-percent fund* (series F 104) refers to the appropriation of 25 percent of the net revenues during any fiscal year from each national forest to be paid at the end of such year to the State or Territory in which the forest is situated, for the benefit of the public schools and public roads of such county or counties. This fund represents a permanent appropriation established by the Act of May 23, 1908.

The *Arizona and New Mexico school fund* (series F 105) refers to the Act of June 20, 1910, which appropriates, out of any money not otherwise appropriated, an amount equal to such proportion of the gross proceeds (during each fiscal year) of all the national forests within the States of Arizona and New Mexico, as the area of land granted to the States for school purposes within these forest reserves bears to the total area of all national forests within the two respective States.

*Allotments for roads and trails* (series F 107) are based on the Act of March 4, 1913, which appropriates 10 percent of all moneys received from the national forests during each fiscal year for the

construction and maintenance of roads and trails within the national forests in the States from which such proceeds are derived.

*Allotments for the acquisition of lands* (series F 108) refer to special acts applicable to national forests in Utah, Nevada, and California. Such allotments are for the acquisition of land to facilitate the control of soil erosion and flood damage originating within the exterior boundaries of those forests, in accordance with the provisions of the special acts authorizing annual appropriations of forest receipts for such purposes.

**F 109-111. Lumber production, decennially 1799-1899, annually 1904-1945.** SOURCE: For 1799-1928, see Reynolds, R. V., and A. H. Pierson, *Lumber Production, 1869-1934*; for 1929-1945, data are from Department of Agriculture, Forest Service records. Primary sources of data for 1869-1899, 1909, 1919, 1942-1945 are Bureau of Census reports of Biennial Census of Manufactures and annual reports on forest products; for other years, Forest Service estimates based on reported production.

**F 112-122. Stumpage, log, and lumber prices, 1900-1945.** SOURCE: Department of Agriculture, Forest Service, *Stumpage Prices of Privately Owned Timber in the United States*, Technical Bulletin No. 626; also Bureau of the Census records; for 1928-1943, see Forest Service, *Stumpage and Log Prices*, annual bulletins.

**F 123-131. Wood products treated with preservatives, 1909-1945.** SOURCE: Department of Agriculture, Forest Service, in cooperation with the American Wood-Preservers' Association, annual report, *Quantity of Wood Treated and Preservatives Used in the United States*.

**F 132-136. Consumption and production of pulpwood, wood pulp, paper and paperboard, 1898-1945.** SOURCE: Compiled by the Department of Agriculture, Forest Service, from Bureau of the Census reports of Biennial Census of Manufactures and annual reports; *Forest Service Bulletins* of the War Production Board; U. S. Pulp Producers Association, *Wood Pulp Statistics*, July 1946; American Paper and Pulp Association, *The Statistics of Paper*, March 1947.

**F 137-142. Gum and wood naval stores production, 1898-1945.** SOURCE: For 1898-1932, see *Gamble's International Naval Stores Year Book*, 1932-33 and 1939-1940; for 1932-1945, see same, and Department of Agriculture, Bureau of Agricultural and Industrial Chemistry, *Annual Reports*.

**F 143-150. Number of forest fires and area burned over, 1906-1945.** SOURCE: Department of Agriculture, Forest Service records. Data for current years will be found in annual report, *Forest Fire Statistics*.

**F 151-154. Expenditures for forest fire control on State and private lands, 1912-1945.** SOURCE: Department of Agriculture, Forest Service records.

### Fisheries: Series F 155-219

**F 155-219. General note.** These series were obtained from the Department of the Interior, Fish and Wildlife Service. The statistics are published in greater detail in publications of the Fish and Wildlife Service and its predecessor agency, the Bureau of Fisheries, which include data on the volume of the catch of individual species of fish and shellfish and their value, employment in the fisheries, quantity of gear operated, the number of fishing and transporting craft employed in the capture and transporting of fishery products, employment in wholesale and manufacturing establishments, and volume and value of the production of manufactured fishery products. See also *Fishery Resources of the United States*, Senate Document No. 51, 79th Congress, 1st Session, 1945.

#### FISHERIES YIELD AND DISPOSITION (F 155-159)

**F 155-159. Yield and disposition of catch, United States and Alaska, 1929-1945.** SOURCE: Department of Interior, Fish and Wildlife Service. These data are partly estimated.

#### FISHERIES CATCH (F 160-192)

**F 160-165. Catch, United States and Atlantic coast, 1804-1945.** SOURCE: Department of Interior, Fish and Wildlife Service.

**F 160. Haddock catch, 1880-1945.** SOURCE: Department of Interior, Fish and Wildlife Service. Data are partly estimated. Haddock is the mainstay of the United States otter trawl fishery and is the most valuable of all the North Atlantic coast fisheries. The haddock of the Northwest Atlantic make up a complex of populations of which at least three main groups are recognized, inhabiting, respectively, the New England Banks, the Nova Scotian Banks, and the Newfoundland Banks.

**F 161. Shad catch, 1892-1944.** SOURCE: Department of Interior, Fish and Wildlife Service. Data were obtained by actual canvass for most of the years shown. The other years were obtained by interpolation. The shad catch ranks thirtieth among the fisheries of the United States (see *Fishery Resources of the United States*, cited above for series F 155-219). The shad is a native species of the Atlantic Coast, and was once among the most abundant fish along the Pacific Coast, having been brought there from the Atlantic.

**F 162. Menhaden received, 1873-1898, 1912, 1921-1945.** SOURCE: Data for 1873-1898 are from *Aquatic Products in Arts and Industries* by Charles H. Stevenson, Report of the Commissioner of Fisheries, 1902; for 1912, 1921-1945 from Fish and Wildlife Service reports. The menhaden is used almost exclusively in the manufacture of meal and oil, only small quantities are canned. The menhaden fishery started in New England, but is now centered in the Middle Atlantic States.

Menhaden are usually sold by number rather than by weight. The number of fish is obtained by measurement. The fish are measured in a "quarter box," each segment of which holds a volume of 22,000 cubic inches which constitutes an arbitrary measure of 1,000 fish. This is based on one standard menhaden occupying a volume of 22 cubic inches. The actual number of fish required per unit of measure of course shows considerable variation. The weight of 22,000 cubic inches of menhaden is about 666 pounds. The number of fish shown can be converted to pounds by multiplying by 0.67.

**F 163. Whales killed, 1909-1945.** SOURCE: Department of Interior, Fish and Wildlife Service.

**F 164. Atlantic Coast mackerel catch, 1804-1944.** SOURCE: Department of Interior, Fish and Wildlife Service. Data are partly estimated. Atlantic Coast mackerel spawn from Cape Hatteras to the southern part of the Gulf of St. Lawrence, the principal spawning areas being located between Chesapeake Bay and Cape Cod Bay.

**F 165. Atlantic Coast, cod catch, 1880-1944.** SOURCE: Department of Interior, Fish and Wildlife Service. Data are partly estimated. The cod resource is perhaps the largest of the North American Banks and yields a billion pounds of fish a year to fishermen of the United States, Canada, and Newfoundland. The heaviest concentrations of cod on the New England Coast are found on eastern Georges Bank, in the same localities as haddock, but somewhat earlier in the season. The biggest part of the United States catch of cod is taken with otter trawls; the balance with lines, sink gill nets, floating traps, and pound nets.

**F 166-172. Catch, New England States, 1887-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The North Atlantic region equivalent to the New England States is characterized by a wide continental shelf, which in some places extends out from the coast for hundreds of miles. Large areas of the shelf rise to form submerged plateaus, called banks, on which lives a vast population of bottom-living fishes. Most important among them are the haddock, rosefish, cod, flounders, and pollock.

**F 173-177. Catch, Middle Atlantic and Chesapeake Bay States, 1880-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The Middle Atlantic States and Chesapeake Bay States are the most important producing centers for oysters, blue

crabs, menhaden and shad, alewives, and striped bass. Large quantities of flounders, butterfish, croaker, scup, "sea trout," and whiting are taken close inshore in summer with pound nets, offshore in winter with trawls. The most important shore fishery industries in this area are the packing of shucked oysters and fresh-cooked crab meat and the manufacture of fish meal and oil.

**F 178-179. Catch, South Atlantic and Gulf States, 1880-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The South Atlantic and Gulf States are the seat of the largest shrimp fishery in the world. This crustacean lives on the floor of the continental shelf, is taken almost entirely with otter trawls operated from motored craft. Other important fishes are mullet taken largely on the west coast of Florida; menhaden, used in manufacture of meal and oil; alewives, sea trout, red snapper, and Spanish mackerel.

**F 180-185. Catch, Pacific Coast States, 1888-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The North Pacific States' most important fisheries are for salmon, halibut, sharks, albacore, crabs, and oysters. In recent years an otter trawl fishery for flounders, rockfishes, and lingcod has been developing rapidly. Shore industries are based on canning, curing, packaging of fresh and frozen fish and shellfish, and the manufacture of fish-liver vitamin oils.

The South Pacific Coast receives the greatest volume of fish landed anywhere in America. Foremost fishery is for the sardine, the largest fishery resource in the Western hemisphere, which supplies raw material for cheap canned foods, fish meal, and oil.

**F 186. Catch, Great Lakes and the international lakes of northern Minnesota, 1885-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The Great Lakes and their connecting waters form the largest single fresh-water area in the world. They have a surface area of about 60.9 million acres.

The Great Lakes provide a great diversity of habitat and different areas vary widely as to kinds and abundance of their fish populations. In general, the shallower waters contain the largest variety of species and yield the largest catches. Thus Lake Erie, the shallowest of the lakes, is the most productive.

The lake trout is the most valuable Great Lakes fishery resource yielding around 10 million pounds annually. Other important types of fish are the pikeperches, lake herring, chubs, and yellow perch.

**F 187-188. Catch, Mississippi River and tributaries, 1894-1931.** SOURCE: Department of Commerce, Bureau of Fisheries.

**F 189-192. Catch, Alaska, 1927-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. Alaska is the chief production center of salmon, most valuable fishery resource of the United States. It is also an important source of herring, halibut, sablefish and clams.

#### LANDINGS (F 193-198)

**F 193-198. Landings at certain New England ports, 1893-1944.** SOURCE: United States Department of the Interior, Fish and Wildlife Service.

#### FISHERY PRODUCTS (F 199-215)

**F 199. Production of frozen fish, United States, 1920-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service.

**F 200-211. Production of canned fishery products, 1921-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. According to *Fishery Resources of the United States*, cited above (see text for series F 155-219), "in 1941, 400 canneries produced over 900 million pounds of canned fish and shellfish. The Pacific Coast States and Alaska produced 82 percent of the pack, the Atlantic Coast and Lake States 16 percent, and the Gulf States 2 percent." The standard case, used here as the unit of measure, varies in weight according to type of fish, as follows: Salmon, 45 pounds; sardines, 20.3 pounds; solid pack tuna, 21 pounds; and grated tuna, 18 pounds. Standard cases of shellfish generally consist of 48 10-ounce cans of varying net weights depending on the contents.

**F 212-215. Production of fish scrap and meal, and fish and marine oils, 1921-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. Fish scrap and meal are used as constituents of animal feeds. Fish and fish liver oils are the most valuable of fishery by-products and are used for medicinal purposes, for fortifying animal feeds, and in a variety of industrial processes.

#### SPONGES AND SEALS (F 216-219)

**F 216-217. Sales of sponges at the Tarpon Springs Sponge Exchange, 1913-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service, *Sp. 1556-B. B. Sponge Transactions at Tarpon Springs*. The sponge fishery of the United States is carried on only in a limited area in Florida.

**F 218-219. Pribilof Islands seal herd, 1910-1945.** SOURCE: Department of the Interior, Fish and Wildlife Service. The main breeding colonies of fur seals are on St. Paul and St. George Islands, the largest of the Pribilof group which lie off the coast of Alaska. The fur seal herd which comprises 80 percent of all the fur seals in the world is national property, exploited under the direction of and for the profit of the Federal Government. For early figures on the Pribilof Islands seal herd, see U. S. Bureau of the Census, "Report on the Population, Industries, and Resources of Alaska," pp. 61-67, and "Report on the Seal Islands of Alaska," in vol. VIII, Tenth Census Reports (1880); and Eleventh Census Reports (1890), *Report on Population and Resources of Alaska*, pp. 215-216.

Series F 1-7.—LAND—ACQUISITION AND EXTENT OF TERRITORY AND PUBLIC DOMAIN, CONTINENTAL UNITED STATES: 1781 TO 1945

[Areas are as computed in 1912, hence do not agree with total figures (in square miles) shown in series B 25, or with figures (in acres) shown for 1940 and 1945 in series F 25-27 and F 37]

YEAR AND HOW ACQUIRED	ACQUISITION OF THE TERRITORY OF THE UNITED STATES			ACQUISITION OF THE ORIGINAL PUBLIC DOMAIN			Estimated area of the public domain <sup>1</sup> (selected years)

1846, Oregon Compromise	183,386,240	180,644,480	2,741,760	183,386,240	180,644,480	2,741,760	
1845, Annexation of Texas <sup>3</sup>	249,066,240	246,777,600	2,288,640				
1819, Cession from Spain	46,144,640	43,342,720	2,801,920	46,144,640	43,342,720	2,801,920	
Red River Basin <sup>4</sup>	29,601,920	29,066,880	535,040	29,601,920	29,066,880	535,040	
1803, Louisiana Purchase <sup>5</sup>	529,911,680	523,446,400	6,465,280	529,911,680	523,446,400	6,465,280	
1802, estimate of public domain							200,000,000
1783, Treaty with Great Britain	541,364,480	526,570,240	14,794,240				
1781-1802 (State Cessions)				236,825,600	233,415,680	3,409,920	

<sup>1</sup> Estimated from imperfect data available for indicated years.  
<sup>2</sup> Estimated area of public domain in 1946.  
<sup>3</sup> Data for Louisiana Purchase exclude areas eliminated by the Treaty of 1819 with Spain. Such areas are included in figures for annexation of Texas and the Mexican Cession.  
<sup>4</sup> Includes 33,920 acres subsequently recognized as part of the State of Texas which is not a public domain State.  
<sup>5</sup> Represents drainage basin of the Red River of the North, south of the 49th parallel. Authorities differ as to the method and exact date of its acquisition. Some hold it as a part of the Louisiana Purchase, others maintain it was acquired from Great Britain.

<sup>1</sup> Includes receipts from such sources as the following: Sales of public and ceded Indian lands; fees and commissions; mineral rentals, royalties, and bonuses; sales of timber; grazing fees and rentals; and land rentals.

<sup>2</sup> Includes grants for such public purposes as the following: Educational, penal, and other public institutions and buildings; bridges, reservoirs, and other internal improvements; reclamation of swamp and arid lands; experiment stations; recreational areas; wildlife and forestry areas; military camps; and payment of bonds issued by local governments. Does not include grants tabulated in series F 20-24. Does not include acreage of swamplands lost to the States, for which the States received indemnity in cash.

<sup>3</sup> Includes homesteads.

<sup>4</sup> Previous to 1911 the data included, in addition to original entries and selections, some classes of final entries and patents.

<sup>5</sup> Exclusive of commuted homesteads.

<sup>6</sup> Does not include recreational demonstration areas.

<sup>7</sup> The travel year is October 1-September 30. Data are estimated in part.

<sup>8</sup> Not reported.

<sup>9</sup> Less than 1,000 acres.

<sup>10</sup> The increase in area over 1925 was reported as the result of a "special check" of field office records which was "used as a basis for a complete revision of the vacant land statistics."

<sup>11</sup> Grants of unsurveyed lands to Wisconsin for forestry purposes; area not determined.

<sup>12</sup> Except on ceded Indian lands.

<sup>1</sup> 1920 data used also for 1925; 1930 data for 1935; and 1940 data for 1945. Land and water areas were completely remeasured in 1940. The difference between the new measurements and those reported in earlier years is due primarily to the redetermination of the outer limits of the United States, the improvement in mapping, and the fact that certain bodies of water included in previous measurements were omitted under the definitions adopted in 1940.

<sup>2</sup> More than half of the forest and woodland in the United States is grazed by livestock. Nonfarm grazing land includes arid woodland and other noncommercial forest land.

<sup>3</sup> Improved farm land.

<sup>4</sup> Unimproved farm land.

<sup>5</sup> Not available.

Series F 37-51.—LAND UTILIZATION—LAND OWNERSHIP, PUBLIC AND PRIVATE: 1920 TO 1945

[ In millions of acres. Data represent approximations only, rather than the results of a detailed enumeration ]

YEAR	TOTAL LAND AREA <sup>1</sup>					PUBLIC LAND					PRIVATE LAND				
	All land	Crop-land	Pasture and grazing land	Forest and woodland <sup>2</sup>	Other land <sup>3</sup>	Total	Crop-land <sup>4</sup>	Pasture and grazing land	Forest and woodland	Other land	Total	Crop-land	Pasture and grazing land	Forest and woodland	Other land

<sup>1</sup> The land area was remeasured in 1940 and revised from 1,903 to 1,905 million acres, see series F 25-36.

<sup>2</sup> Excludes considerable acreages of arid woodland, other woodland in pasture and grazing, and several million acres of valuable forests in parks, wildlife refuges, and military areas included in other lands. In 1945, these additional areas totaled 136 million acres.

<sup>3</sup> Includes urban areas, farmsteads, parks, railroads, roads, military lands, and nonagricultural lands such as sand dunes, open swamp, rock, and desert land.

<sup>4</sup> Comprised largely of Indian land and State school and other land leased out to farmers for farming purposes.

<sup>5</sup> Preliminary.

## Series F 52-61.—LAND UTILIZATION—DRAINAGE AND IRRIGATION: 1890 TO 1940

[In thousands of acres, except number of farms. See text for list of States allocated to groups described here]

YEAR	DRAINAGE, UNITED STATES				IRRIGATION, 17 WESTERN STATES AND ARKANSAS AND LOUISIANA				IRRIGATION, 29 HUMID STATES <sup>4</sup>	
	Acreage in drainage enterprises			Cropland planted (acreage)	Acreage irrigated <sup>1</sup>	Acreage in irrigation enterprises <sup>2</sup>	Farms with irrigated land		Acreage irrigated	Number of farms with irrigated land
	Total	Improved land	Unimproved land				Number of farms <sup>3</sup>	Acreage		
	52	53	54	55	56	57	58	59	60	61
1940	86,967	67,389	19,578	49,614	21,004	31,306	291,655	112,601		
1939									166	7,949
1934									96	6,410
1930	84,408	63,514	20,894	54,428	19,548	30,599	265,147	78,339		
1920	65,495	44,288	21,207	( <sup>5</sup> )	19,192	35,891	222,739	( <sup>5</sup> )		
1910					14,433	32,245	162,723	( <sup>5</sup> )		
1902									56	1,875
1900					7,744	( <sup>5</sup> )	<sup>6</sup> 113,849	( <sup>5</sup> )		
1899									44	1,426
1890					3,716	( <sup>5</sup> )	54,136	( <sup>5</sup> )		

<sup>1</sup> All land irrigated or for which water was received, including crop and pasture land irrigated, land in young crops not harvested, crop failure, and land being fallowed and prepared for cultivation as reported by the Censuses of Irrigation.

<sup>2</sup> Area reported irrigable in 1940 and 1930 Censuses of Irrigation and total area in enterprises for 1920 and 1910 censuses.

<sup>3</sup> Relates to farms reporting irrigated cropland harvested and/or irrigated pasture, 1940 Census of Agriculture; and farms reporting irrigated crops 1930, 1920, and 1910 censuses.

<sup>4</sup> Excludes Arkansas and Louisiana.

<sup>5</sup> Not available.

<sup>6</sup> Revised.

## Series F 62-68.—LAND UTILIZATION—AGRICULTURAL LAND UTILIZATION PROGRAM, SOIL CONSERVATION SERVICE AND ANTECEDENT AGENCIES: 1935 TO 1945

[In acres]

CALENDAR YEAR	Total area managed <sup>1</sup>	USE OF LAND MANAGED				Unclassified	Areas transferred to State agencies with SCS maintaining custodial responsibility
		Grazing	Annual crops	Hay	Forest		
		62	63	64	65

1 Figures for 1921-1945 are for calendar years.

2 Figures for 1924-1932 and 1939-1945 are for calendar years.

3 Provided by the Clarke-McNary law, Act of June 7, 1924, and the Norris-Doxy law, Act of May 18, 1937.

4 Adjusted from figures which included sightseers and transients.

5 Comprises total for all years prior to 1925.

6 Last 6 months of calendar year.

Series F 88-102.—NATIONAL FORESTS—TIMBER CUT AND RECEIPTS: 1905 TO 1945

[Volume in millions of board feet; value in thousands of dollars]

<sup>1</sup> Includes materials not measurable in board feet, such as Christmas trees, tan-bark, turpentine, seedlings, Spanish moss, etc.  
<sup>2</sup> Fiscal year data, 1905 to 1920, and 1933 to 1946. Calendar year data, 1922 to 1932. Figures for 1921 are for 13-month period, July 1, 1920, to Dec. 31, 1921. Figures for both 1932 (calendar year) and 1933 (fiscal year) include data for 6-month period, July 1 to Dec. 1, 1932.

<sup>3</sup> Includes free use not reducible to board feet. Value in dollars as follows: 1934, \$146; 1935, \$370; 1937, \$1,969; 1938, \$3,643; 1940, \$3,774; 1944, \$7,304; and 1945, \$8,291.

<sup>4</sup> Includes land-exchanges figures from beginning of exchange cuttings.  
<sup>5</sup> Estimated.

Series F 103-108.—NATIONAL FORESTS—PAYMENTS TO STATES AND TERRITORIES, AND ALLOTMENTS TO FOREST SERVICE: 1906 TO 1945

## Chapter G. Minerals and Power (Series G 1-233)

### Mining and Minerals: Series G 1-158

**G 1-158. General note.** All data for these series were provided by the Bureau of Mines of the United States Department of the Interior, with the exception of data shown for series G 6-12. The Bureau of Mines cites for principal reference two annual publications: *Mineral Resources of the United States*, published annually for the period 1882 to 1931; and *Minerals Yearbook*, published annually for the period 1932-33 to 1946. These volumes were prepared and issued by the United States Geological Survey from 1882 to 1923 and by the Bureau of Mines from 1924 to 1945.

In the instance of series G 65-130, the descriptive term "production" must be interpreted with caution. In early years, "production" was used loosely; later, it was superseded by a more precise statement of the means of measuring production, such as "shipments," "sales," or "sold or used by producers." Since only a limited number of series can be presented in this volume of historical statistics, that series has been selected, for each mineral, which provides reasonably comparable "production" data as far back in time as possible, and for which value data are also available. Also, the presentation of "production" data for early years and "shipments" or "sales" data for recent years does not mean necessarily that a "production" series is not available for recent periods. Instead, it usually means that the figures labelled "production" in early years are more comparable with the more recent "shipments" or "sales" data than they are with the modern "production" series, as such.

#### VALUE OF MINERALS AND PRODUCTION INDEXES (G 1-12)

**G 1-5. Value of mineral products of the United States, 1880-1945.** SOURCE: For general reference see general note above (series G 1-158); see also *Minerals Yearbook*, 1945, "Statistical Summary of Mineral Production," p. 33. Total values represent summarizations of data given in commodity chapters of *Mineral Resources of the United States* and *Minerals Yearbook*. As far as is practicable, the value of minerals produced is expressed in their first marketable form or in the stage of production thought best to represent the mineral industry. Duplication has been eliminated wherever feasible. Because of the absence of major changes, data are considered comparable for all years. The source volumes should be consulted for discussion of minor changes and other detail.

**G 6-8. Indexes of mineral production, 1919-1945.** Base: 1935-1939 average=100. SOURCE: Board of Governors of the Federal Reserve System. For 1919-1942, see *Federal Reserve Index of Industrial Production*, October 1943, pp. 43-44 and 98-100; for 1943, see *Federal Reserve Bulletin*, April 1944, p. 385; for 1944-1945, see *Federal Reserve Bulletin*, April 1946, p. 423. For a brief description of the method of constructing this index, see text for series J 30-48.

**G 9-12. Indexes of physical output in mining, 1899-1939.** Base: 1899=100. SOURCE: Barger, Harold, and Schurr, Sam H., *The Mining Industries, 1899-1939: A Study of Output, Employment and Productivity*, National Bureau of Economic Research, New York, 1944, p. 14. Indexes were constructed by combining data on physical output "of as many minerals as possible," with values as weights. For the period since 1919, the indexes cover the output of more than 99 percent of all minerals for which value data are available. Data do not include smelting and refining of metals, the coking of coal, the refining of crude oil, the production of cement, the calcining of gypsum, and the cutting of dimension stone.

#### FUELS (G 13-64)

**G 13-18. Bituminous and anthracite coal production and value, 1807-1945.** SOURCE: See detailed listings below. See also series G 154-155 which give total production, bituminous and anthracite combined, and tonnage per man-hour.

**G 13-15. Bituminous coal: Production, 1807-1945; value, 1890-1945.** SOURCE: See general note, series G 1-158. For production data from 1807-20 to 1889, see *Mineral Resources of the United States*, 1923, part II, table 22, p. 549. For production and value data from 1890 to 1945, see *Minerals Yearbook*, 1946, p. 286. Data for 1945 are preliminary and are derived from records of the Bureau of Mines.

Production figures include the small output of anthracite and semianthracite produced outside of Pennsylvania, and the production of lignite; they exclude data from small mines having an output of less than 1,000 tons per year that sell their output by wagon or truck. In 1944, according to incomplete figures, there were 1,821 small mines producing less than 1,000 tons per year, with a total production of 756,307 net tons (see *Minerals Yearbook*, 1945, p. 906). Prior to 1890, for years other than census years, production figures were not compiled on the basis of direct returns from operators. The method of compiling figures during these prior years is described as follows on page 11 of *Mineral Resources*, 1883-1884: "The coal statistics of this volume have been drawn from various sources, including the reports of agents and correspondents of this office, the transportation records of the railroad companies, reports of State Mine Inspectors and of State Geological Surveys, etc." Since 1890 production figures have been compiled on the basis of detailed annual reports furnished by the producers. Data for a small percentage of the output, consisting chiefly of that of small mines, are obtained from the records of the State Mine Departments or from railroad carloadings.

Value data represent dollars received or charged for coal f.o.b. the mines. The value of coal not sold but used by the producer has been estimated at average prices that might have been received if sold commercially. Value figures for 1890 to 1936 inclusive, and 1939, exclude selling expense. Figures for other years include selling expense.

**G 16-18. Anthracite coal: Production, 1807-1945; value, 1890-1945.** SOURCE: See general note, series G 1-158. For production data from 1807-20 to 1889, see *Mineral Resources of the United States*, 1923, part II, table 22, p. 545. For production, and value data from 1890 to 1945, see *Minerals Yearbook*, 1945, pp. 947, 948.

Pennsylvania anthracite includes all nonbituminous coal mined in Pennsylvania, including that from deep mines, strip pits, and culm banks, and river or creek coal recovered from the streams draining the anthracite fields. Coal purchased by legitimate operators from "bootleg" mines has been included since 1941. Also, for purposes of historical comparison, the statistics include the output of the Bernice Basin in Sullivan County, Pa., although coal of this Basin has been officially classified as semianthracite according to the American Society For Testing Materials Tentative Standard. Anthracite statistics are prepared from an annual canvass by mail of all known legitimate anthracite operations that are active producers. More than 95 percent of the tonnage is reported directly, and the remainder is collected by personal visits or from reliable collateral evidence.

**G 19-32. Bituminous coal and lignite mining, 1890-1945.** SOURCES: Bureau of Mines, *Minerals Yearbook*, 1946, p. 286. Series G 13a comprises a segment of series G 13 (bituminous production),

repeated here for convenience in reference. See also general note for series G 1-158, above.

**G 19. Men employed, 1890-1945.** SOURCE: See *Minerals Yearbook*, 1946, p. 286. Data represent average number of workers employed. Figures are reasonably comparable for the entire period, although slight variations have occurred in the wording of the questionnaire on employment sent to coal-mine operators.

**G 20. Number of mines, 1895-1945.** SOURCE: Same as for series G 19. Data include all mines producing 1,000 tons per year and over. For figures for small mines, based on incomplete information, see *Minerals Yearbook*, 1945, p. 906.

**G 21-23. Calculated capacity, 1890-1945.** SOURCE: Same as for series G 19. Potential annual output is derived by applying the average output per day worked to the number of "potential" work days. A total of 308 days represents the maximum number of work days; 280 "potential" days was suggested by the coal committee of the American Institute of Mining and Metallurgical Engineers; 261 days is the annual equivalent for the 5-day week.

**G 24. Average number of days worked, 1890-1945.** SOURCE: *Minerals Yearbook*, 1946, p. 287. These figures were obtained by dividing the total man-days by the number of men employed.

**G 25-26. Average number of days lost on account of strikes, 1899-1945.** SOURCE: Same as for series G 24. These figures were obtained by dividing the total man-days lost by the number of men employed, and by the number of men on strike.

**G 27-28. Net tons per man, 1890-1945.** SOURCE: Same as for series G 24. Net tons per man per day represents the total man-days divided by the total production. Net tons per man per year represents the total production divided by the number of men employed.

**G 29-30. Percent of underground production: Cut by machines, 1891-1945; percent mechanically loaded, 1923-1945.** SOURCE: Same as for series G 24. Percentages for production cut by machines for the years 1890 to 1913, inclusive, are of total production; a separation of strip mine and underground production is not available for those years.

**G 31-32. Percent of total production mechanically cleaned, 1906-1945, and percent mined by stripping, 1914-1945.** SOURCE: Same as for series G 24. For the years 1906 to 1926, inclusive, the percentages of underground production mechanically cleaned are exclusive of coal cleaned at central washeries operated by consumers; after 1926, when data became available on the tonnage cleaned by consumer-operated plants, the percentages include the total tons cleaned at the mines and at consumer-operated washeries.

**G 33-42. Pennsylvania anthracite industry, 1890-1945.** SOURCE: Bureau of Mines, *Minerals Yearbook*, 1945, pp 947-948. Also see series G 16-18. Series G 16a, shown here, comprises a segment of series G 16, repeated here for convenience in reference.

**G 33-34. Foreign trade, 1890-1945.** SOURCE: *Minerals Yearbook*, 1945, pp. 947-948. Data on exports and imports obtained from United States Department of Commerce. For figures for individual countries, and for years prior to 1890, see annual volumes of *Foreign Commerce and Navigation, Immigration, and Tonnage*. Canada is the largest anthracite export market.

**G 35. Consumption, calculated, 1890-1945.** SOURCE: Same as for series G 33-42. Figures on consumption prior to 1913 take no account of producers' stocks, there being no data available for this item.

**G 36-37. Employment, 1890-1945.** SOURCE: Same as for series G 33-42. Number of men employed includes workers from strip-pit and dredge operations. Men working in "bootleg" or illicit coal mining are not included. For "bootleg" employment estimates, 1941-1945, see *Minerals Yearbook*, 1945, p. 933.

**G 38-39. Average tons per man, 1890-1945.** SOURCE: Same as for series G 33-42. Output per man per day based on legitimate (as against "bootleg") production only.

**G 40. Net tons cut by machines, 1911-1945.** SOURCE: Same as for series G 33-42. Data were first collected on this item in 1911.

**G 41. Net tons produced by stripping, 1915-1945.** SOURCE: Same as for series G 33-42. Data were first collected on this item in 1915.

**G 42. Net tons loaded mechanically underground, 1927-1945.** SOURCE: Same as for series G 33-42. Data were first collected on this item in 1929; the figures for 1927 and 1928 were reported by the Department of Mines of the Commonwealth of Pennsylvania.

**G 43-56. Coke industry, 1880-1945.** SOURCE: *Minerals Yearbook*, 1945, pp. 968-969. Also see general note, series G 1-158. Coke production or coal carbonization is a process of modifying a crude raw fuel into special purpose fuels and extracting valuable coal chemical materials before they are destroyed in the burning. Data include only coke made by high-temperature carbonization of coal in byproduct and beehive ovens.

The principal application of coke is in the manufacture of pig iron. Usually about 70 percent of the total output of coke is consumed in blast furnaces and iron foundries, 20 percent for domestic heating, and 10 percent for other industrial purposes such as non-ferrous smelting, manufacturing producer-gas and water-gas, chemical processes and other miscellaneous uses. However, these percentages are subject to wide variations depending on the demand for coke from the iron and steel industry.

The term "value" as applied to coke means the value at ovens. Over 61 percent of the byproduct coke now produced is made in ovens operated by corporations which mine the coal they use and operate blast furnaces that consume the bulk of the output of their ovens.

Value of tar in all byproducts (series G 56) for 1906 through 1917 represents value of tar "obtained and sold" and does not always include value of tar used by producer. Beginning with 1918, tar used by producer is specifically included. The value of breeze produced at byproduct plants is included for those years for which it was reported, namely 1916, 1917, and 1919-1945. For other byproducts, only value of those sold is included. Value of breeze produced at beehive plants is not included as it has usually been much less than a million dollars.

**G 57-58. Petroleum production, 1859-1945.** SOURCE: See general note, series G 1-158; see also annual volumes of *Minerals Yearbook* as follows: For data for 1859-1935, see 1937 volume, p. 1008; for 1936, see 1940 volume, p. 954; for 1937-1940, see 1941 volume, p. 1031; for 1941-1944, see 1945 volume, p. 1052; for 1945, see 1946 volume, p. 880. Petroleum data are obtained from monthly reports from pipe-line companies accounting for crude removed from leases and supplemented by data covering changes in crude stocks on leases and crude oil checked as fuel in production operations. In addition, a check is made of crude oil shipped from leases by tank car or truck. To determine the average value at the well, an annual canvass is made of the principal producers and pipe lines by States of origin.

**G 59-64. Natural gas and natural gasoline, 1906-1945.** SOURCE: See general note, series G 1-158, and detailed listings below.

**G 59-61. Natural gas production, 1906-1945.** SOURCE: See general note, series G 1-158; see also annual volumes of *Minerals Yearbook* as follows: For data for 1906-1935, see 1937 volume, p. 1062; for 1936-1940, see 1941 volume, p. 1120; for 1941-1944, see 1945 volume, pp. 1153 and 1160; for 1945, see 1946 volume, p. 812. Figures shown for production represent essentially the amount of gas usefully consumed and have been termed "marketed production." These figures do not measure the total volume of gas withdrawn from natural reservoirs since they take no account of losses and waste.

**G 62-64. Natural gasoline production, 1911-1945.** SOURCE: See above for series G 1-158; see also annual volumes of *Minerals Yearbook* as follows: For data for 1911-1935, see 1937 volume, p. 1097; for 1936-1938, see 1940 volume, p. 1084; for 1939-1940, see 1941

volume, p. 1156; for 1941-1944, see 1945 volume, p. 1183; for 1945, see 1946 volume, p. 836.

Figures include only natural gasoline and cycle products; they exclude liquified petroleum gases. Figures shown for series G 64 for 1941-1945 were obtained from records of the Bureau of Mines. Average per gallon data for these years shown in the source volumes include liquified petroleum gases and therefore differ from those shown here.

#### NONMETALS (G 65-92)

**G 65-76. Production of nonmetal building materials, 1880-1945.** SOURCE: See general note, series G 1-158; see also detailed listings below.

**G 65-66. Cement shipments, 1880-1945.** SOURCE: See general note, series G 1-158. Figures for 1880-1890 are estimates, believed to be substantially correct. Since 1890, figures result from an annual canvass of the industry. Beginning with 1912, data are based on shipments; prior to 1912, data covered production. Three types of cement are included: Natural cement, portland cement, and puzzolan cement. From 1880 through 1895 only production of natural and portland cements was reported. Figures on puzzolan cement were first collected in 1896. Thereafter data include all three types of cement. Weight per barrel of the three kinds of cement has varied; therefore the total in barrels is not exactly comparable for a number of years. The weight per barrel of portland cement ranged from 400 pounds in 1882 to 376 pounds in 1916; barrels of natural cement ranged from 300 pounds in 1882 to 240 pounds in 1891 and 376 pounds in 1921; barrels of puzzolan cement likewise varied. Since 1921, however, the output of all types of cement has been reported in barrels of 376 pounds.

**G 67-68. Gypsum production, 1880-1945.** SOURCE: See general note, series G 1-158. For 1880-1930, see annual volumes of *Mineral Resources of the United States* as follows: For data for 1880-1888, see 1895-96 volume, part III, p. 981; for 1889-1914, see 1914 volume, p. 261; for 1915-1919, see 1919 volume, p. 99; for 1920-1927, see 1928 volume, part II, p. 157; for 1928-1930, see 1930 volume, part II, p. 880. For 1931-1945, see the following annual volumes of *Minerals Yearbook*: For 1931-1933, see 1934 volume, p. 852; for 1934-1936, see 1937 volume, p. 1229; for 1937-1939, see 1940 volume, p. 1229; for 1940, see 1941 volume, p. 1293; for 1941-1945, see 1945 volume, p. 1314.

Tonnages of gypsum represent crude gypsum mined and ready for use. Coverage of producers is believed to be virtually complete, except for the first few years.

Value data shown have little bearing on the quantity of crude gypsum mined since values represent finished gypsum products sold including plaster, board, and tile. Furthermore, since 1928, values include gypsum made from foreign gypsum. Production data do not include byproduct gypsum from phosphate and other chemical works; however, the value of such material used in gypsum products is included in the value data for 1928-1945.

**G 69-70. Lime sold by producers, 1880-1945.** SOURCE: See general note, series G 1-158. Data include both quick and hydrated lime. The lime production and value figures for the period 1880-1890 are obviously much too large and are not considered reliable. Earlier values were obtained mostly from trade quotations applied rather indiscriminately to shipments, and possibly included the cost of cooperage and some freight. Values after 1894 are definitely based on bulk lime at the kiln.

Since lime is a semiperishable commodity, only small quantities are stocked at the kiln, and sales may be taken as equivalent to production of "open-market" lime, that is, lime shipped for uses other than in the producer's own plant. Lime burned for consumption by the producer (captive tonnage) is excluded with the exception of small quantities (generally about 10 percent of total lime sold) which are included to complete the coverage of lime shipped to certain specified uses. This method of reporting production has prevailed since 1921. In certain years prior to that

time the quantities of lime produced and used by soda ash manufacturers were included in sales, but this irregularity does not disturb the series noticeably.

**G 71-72. Sand and gravel sold or used, 1902-1945.** SOURCE: See general note, series G 1-158. Data for 1902 cover only a portion of the industry. In 1904, an attempt was made to include most producers of sand; and in 1905, both sand and gravel were included. In the *Minerals Yearbook*, separate figures are shown for the quantity and value of gravel, and the various kinds of sand. See also Bureau of Mines, *Information Circular No. 7203*, 1942, "Development of the Sand and Gravel Industry."

**G 73-74. Slate products sold or used: Quantity, 1912-1945; value, 1880-1945.** SOURCE: For 1880-1913, see United States Geological Survey, *Bulletin 586*, p. 200; for 1914-1931, see annual volumes of *Mineral Resources of the United States*; for 1932-1945, see annual volumes of *Minerals Yearbook*. See also general note, series G 1-158. Figures for 1880 and 1889 were based on census data. Figures for 1881 to 1883 are largely estimated; those for 1884 to 1888 are considered fairly reliable. Beginning with 1891, data are compiled from direct reports of the quarry operators to the Geological Survey and, after 1925, to the Bureau of Mines.

**G 75-76. Stone sold or used by producers: Quantity, 1916-1945; value, 1880-1945.** SOURCE: See general note, series G 1-158. For 1880 to 1915, see *Mineral Resources of the United States*, 1916, part II, p. 995; for 1916-1943, see *Minerals Yearbook*, 1943, pp. 1284, 1299; for 1944 and 1945, see *Minerals Yearbook*, 1945, p. 1273. Data represent quantities used or sold by producers; values are f.o.b. quarries and mills. The data include marble, granite, limestone, dolomite, basalt, sandstone, and "miscellaneous stone" such as light-color volcanic rocks, schists, serpentine, and flint. The statistics combine both "dimension stone" and "crushed and broken stone." The data, however, do not include stone made into abrasives (such as grindstones) or that used in making lime and cement.

**G 77-86. Nonmetals: Chemical materials, 1880-1945.** SOURCE: See general note, series G 1-158, and detailed listings below.

**G 77-78. Barite sold or used by producers, 1880-1945.** SOURCE: See general note, series G 1-158. In general, the quantities and values given are for barite at mine, washer, or beneficiating plant. Data prior to 1885 are estimates based on correspondence with grinders. Beginning in 1886, questionnaires were sent to all known producers.

A consistent attempt was made by the earlier barite statisticians to segregate lump material from ground material, since the latter was always made from lump. The terminology "crude" was therefore adopted for lump barite, although it was fairly pure and required no dressing or beneficiation, and this term will be found in the *Mineral Resources* and *Minerals Yearbook* series until 1944. However, special cases began to arise. In California a true crude was mined which required beneficiation, finally emerging as ground barite. In this case the ground equivalent of the crude was included in the other crude production. In 1941 the tremendous deposits at Malvern, Ark., were opened, and another difficult reporting situation arose. Here the crude was but little more than 50 percent barite, and required flotation; it was sold as ground barite. The same solution was applied, i. e., the ground tonnage was included in the "crude" total. By 1944, however, the Arkansas volume was so large that the term "crude" was modified in the statistical tables of the *Minerals Yearbook*. Since that time mine output of commercial grade barite of whatever form has appeared under the appellation "crude (primary) barite." In statistical releases of the Bureau of Mines published in 1946 and 1947, both modifying adjectives have been dropped wherever possible, and production of barite in any form is reported simply as "barite" with due regard to the elimination of duplication. True values of crushed or ground barite so included were not used; instead an estimated value of an identical tonnage of lump barite was substituted. Values on the whole tend to be lower than trade quotations at any given time,

because there is considerable jobbing activity in the industry, and the statistics reflect the value of the first sale only.

**G 79-80. Feldspar sold or used by producers, 1880-1945.** SOURCE: See general note, series G 1-158. Although the production of feldspar was initiated in the 1860's, no official figures of total output are available before 1880. Data for 1880-1886 represent estimates; beginning with 1887, figures were compiled from annual canvasses of the producers by the Geological Survey and later by the Bureau of Mines. Feldspar data prior to 1915 represent the total sales of both crude and ground feldspar as sold by the producer. The value of the feldspar was taken as the value of the first sale. This combination of crude and ground values in the earlier years gives a somewhat distorted view of the relative importance of the values per unit of quantity, but the figures shown nevertheless indicate the general trend of output during that period. From 1915 through 1920, the value for the tonnage of ground feldspar in each State was recalculated at the average value of the crude feldspar sold in that State and a value of the total spar at the average value for crude was obtained. Beginning in 1921, all feldspar produced and marketed in each State has been reported as crude feldspar even though much of it was first marketed as ground feldspar.

**G 81-82. Salt, sold or used by producers, 1880-1945.** SOURCE: See general note, series G 1-158. Data includes evaporated salt, rock salt, and the salt content of brine produced. Since 1893, value data shown include only net value of the product, exclusive of boxes, bags, barrels, or other containers. Prior to 1893 a great many of the producers reporting, included the value of containers in which the salt was shipped. This may partly explain why values shown were greater in some of the earlier years than for many of the later years.

**G 83-84. Sulfur production, 1880-1945.** SOURCE: See general note, series G 1-158. For 1880-1900, see *Mineral Resources of the United States*, 1910, p. 788. Value data were not available for 1904-1945, therefore the production values were calculated from the average value of shipments for each of those years.

**G 85-86. Pyrites production, 1880-1945.** SOURCE: See general note, series G 1-158; for 1880-1931, see also the following annual volumes of *Mineral Resources of the United States*: 1910 volume, part II, p. 795; 1924 volume, p. 4; 1931 volume, p. 144. For 1932-1945, see annual volumes of *Minerals Yearbook*.

**G 87-90. Nonmetals, fertilizer materials, 1880-1945.** SOURCE: See general note, series G 1-158.

**G 87-88. Potash sold by producers, 1915-1945.** SOURCE: See general note, series G 1-158. "Potash" ( $K_2O$ ) is used here as imposed by convention. This is a hypothetical compound used as a standard basis of computation and comparison of analyses and prices of different potash salts of widely variant composition.

**G 89-90. Phosphate rock sold or used by producers, 1880-1945.** SOURCE: See general note, series G 1-158.

**G 91-92. Magnesite production (crude, mined), 1891-1945.** SOURCE: See general note, series G 1-158. Data pertain to uncalcined magnesite of commercial grade. For 1891-1915, value figures represent the estimated worth of raw magnesite in sacks at San Francisco; for 1915 and prior years, with unimportant exceptions, magnesite was mined only in California. Since World War I, very little raw magnesite has entered the open market and all value data shown are producers' estimates based on cost considerations or a few actual sales.

#### METALS (G 93-130)

**G 93-101. Ferrous metals, production, shipments, and value, 1810-1945.** SOURCE: See general note, series G 1-158 and detailed listings below.

**G 93-95. Iron ore, production, shipments, and value, 1860-1945.** SOURCE: See general note, series G 1-158. Data refer to usable ore and beginning in 1942 include byproduct ore obtained from pyrites. Data for 1860, 1870, and 1880 are originally from census reports for those years; those for 1875 and 1881 are estimates appearing originally in Bell, I. L., *Principles of the Manufacture of*

*Iron and Steel*, 1884, p. 451; and those for 1882 to 1888, inclusive, are estimates made by James M. Swank which appeared originally in volumes of *Mineral Resources* for the years 1882 to 1888.

**G 96-98. Pig iron, production, shipments, and value, 1810-1945.** SOURCE: See general note, series G 1-158. Shipments data do not include ferro-alloys made in blast furnaces. The following reference appears in *Mineral Resources*, 1910, part I, p. 93, with respect to production data for the period 1810-1910: "The statistics for 1854 and all succeeding years were collected by the American Iron and Steel Association; those for 1810, 1840, and 1850 are census figures; those for the other years are largely estimates by early statisticians." Data shown in *Mineral Resources*, 1910, in long tons were converted to short tons for presentation here.

**G 99-101. Ferro-alloys, production, shipments, and value, 1910-1945.** SOURCE: See general note, series G 1-158.

**G 102-103. Mercury production, 1850-1945.** SOURCE: See general note, series G 1-158. Data are on basis of flasks containing 76.5 pounds net avoirdupois prior to June 1904, 75 pounds from June 1904 through 1927, and 76 pounds thereafter. Values are calculated at average price at New York after 1925, but at San Francisco prior thereto. Data prior to 1880 appear in *Mineral Resources*, 1925, part I, p. 44. For this early period, production in California was equivalent to that for the entire country. For early data in greater detail, see also Census Office, *Report on Mineral Industries . . . , Eleventh Census: 1890*, Washington, D. C., 1892, pp. 179-245; and early volumes of *Mineral Resources*, particularly those for 1882, 1883 and 1884, and 1910.

**G 104-111. Metals, alloying, 1880-1945.** SOURCE: See general note, series G 1-158.

**G 104-105. Manganese ore, shipments and value, 1880-1945.** SOURCE: See general note, series G 1-158. Shipments from domestic mines represent standard measure of production.

**G 106-107. Chromite shipments, 1880-1945.** SOURCE: See general note, series G 1-158. Production for 1880-1889 is estimated. Coverage of industry for 1890-1910 is considered to be substantially 95 percent; since 1910 the coverage is virtually 100 percent. Sales by or shipments from mines are used to measure production since the inception of collection of chromite data.

**G 108-109. Tungsten, shipments and value, 1900-1945.** SOURCE: See general note, series G 1-158. Figures for early years are for "production." *Mineral Resources*, 1910, p. 740 (tabular footnote) states, "The production of tungsten ores . . . can be fairly compared only since and beginning with 1906, as before that date no effort had been made to reduce the ores to a common basis of concentration."

**G 110-111. Molybdenum shipments, 1914-1945.** SOURCE: See general note, series G 1-158. Data coverage virtually 100 percent of industry. Data are in terms of pounds of molybdenum contained in molybdenite concentrates. The total absence of production in 1921-1922 reflects a 50 percent drop in alloy steel production in 1921, as well as the general post-war decline in industry.

**G 112-117. Nonferrous metals, production, 1801-1945.** SOURCE: See general note, series G 1-158. See also series G 102-103 (mercury).

**G 112-113. Copper, smelter production, 1845-1945; value, 1880-1945.** SOURCE: See general note, series G 1-158. Figures for years prior to 1882 were compiled by the U. S. Geological Survey "from the best sources available." Smelter production data cover the fine copper content of blister, anodes, etc., produced at the smelters plus furnace refined copper produced from Lake Superior native copper ores and electrolytic copper produced direct from ore or matte by leaching.

**G 114-115. Lead, smelter production, 1801-1945; value, 1880-1945.** SOURCE: For production data, see following volumes: For 1801-1926, see U. S. Bureau of Mines, *Summarized Data of Lead Production*, comprising Economic Paper 5, 1929, pp. 12-13. For 1927-1928, see *Mineral Resources of the United States*, 1930, pt. 1, p. 483. For 1929-1945, see annual volumes of *Minerals Yearbook*

as follows: For 1929-1933, see 1936 issue, p. 140; for 1934-1937, see 1938 issue, p. 114; for 1938-1940, see 1941 issue, p. 128; for 1941-1945, see 1945 issue, p. 161. Value data are as provided by Bureau of Mines and are based on average price each year. Data in series G 114-115 represent production and value of refined lead produced from foreign and domestic ores and domestic base bullion, and do not include refined lead from foreign base bullion. For a more detailed classification of production data, see source volumes.

Statistics on lead output may be prepared on a mine or smelter and refinery basis. The mine-production data compiled on the basis of lead content in ores and concentrates and adjusted to account for average losses in smelting are the most accurate measure of production from year to year. The pig-lead output, as reported by smelters and refiners, presents a more precise figure of actual lead recovery but generally differs from the mine figure due to the overlap or lag between mine shipments and smelter receipts of ore and concentrates. These inequities, however, tend to balance over a period of years.

**G 116-117. Zinc, smelter production and value, 1880-1945.** SOURCE: See general note, series G 1-158. Zinc-production statistics may be prepared on a mine or on a smelter basis. The mine-production data compiled on a basis of zinc content in ores and concentrates and adjusted to account for average losses in smelting are the most accurate measure of output from year to year, especially as to the character and distribution of the production. The slab-zinc production, as reported by smelters, presents a more precise figure of actual zinc recovery but generally differs from the mine figure owing to overlap and lag between mine shipments and smelter receipts of ores and concentrates. These variations, however, tend to balance within the limits of statistical error over a period of years.

**G 118-121. Gold and silver, production and value, 1792-1945.** SOURCE: Director of the Mint, 1792-1903; Bureau of Mines, 1904-1945. For detailed sources, see text for specific series below. Figures for 1792-1873 are ascribed to R. W. Raymond, former United States Commissioner of Mining Statistics, U. S. Geological Survey, whose eighth and last report was that for 1876. A continuation of the series of the Director of the Mint to 1945 (including figures for the Philippines and Puerto Rico) will be found in the *Annual Reports of the Director of the Mint*.

The relationship between the Bureau of Mines and the Bureau of the Mint series, 1904 to 1945, is explained in various annual issues of *Mineral Resources of the United States*, Bureau of Mines, and in the *Annual Reports of the Director of the Mint*. The following is quoted from the 1941 Mint report.

"The official estimate of the production of gold and silver in the United States is made by the Bureau of the Mint with the cooperation of the Bureau of Mines, the [Bureau of Mines] making a mine canvass in each State and the [Bureau of the Mint] working backward from mint deposits through refineries, smelters, and other reduction works to the mine production estimate made by the [Bureau of Mines]. The official estimate represents the material received at mint service offices and private refineries. The difference between this estimate [series of Director of the Mint] and the mine production estimate [series of Bureau of Mines] is almost entirely due to the time element involved in the reducing processes, since differences for series of years are shown by comparison to practically offset each other. The two systems thus verify and support each other."

The above quotation refers to the series published by the two agencies in their complete form—that is, including production data for the Philippines, Puerto Rico, and island possessions. The gold and silver data presented in series G 118-121 are for continental United States and Alaska only.

Since publication of the 1884 *Report of the Director of the Mint Upon the Production of the Precious Metals of the United States*, few major (although some minor) changes have been made in the figures for the period 1848-1880. By 1890 (see *Annual Report of the Director of the Mint*, 1890) the annual figures for 1845-1847,

and the group totals for the period 1792-1834 and 1834-1844, had been added. By 1910, figures in ounces were being presented in addition to the dollar value figures shown in reports through 1900.

Use and interpretation of the data for years prior to 1880 should take into account the confusion out of which the present series were derived. Albert Williams, Jr. (Department of the Interior, U. S. Geological Survey, *Mineral Resources of the United States* [1882], p. 180, observed:

"Total output to date.—It may seem strange to say that one of the most perplexing statistical questions is to state the total gold and silver production of the United States from the beginning of mining operations to the present [1882]. The difficulty lies not so much in the dearth of material as in the embarrassing abundance of statistics, actual and estimated, made by different persons at different times; covering overlapping periods and occasionally showing gaps; including and omitting the product of the Southern States; sometimes including the partial output of the west coast of North America beyond the limits of the United States; estimated on the basis of the calendar year or of the fiscal year; revised, changed, and corrected, until the whole subject seems lost in confusion. And yet there is sufficient reliable evidence upon which to reconstruct an estimate believed to have a probable error not exceeding 5 per cent."

Williams' estimate accepts, in general, the Mint series for 1848-1882, the only segment then available; the principal differences lie in his estimates for the period prior to 1847.

For the years 1881-1945, data are for calendar years. For earlier years, the evidence as to type of year is confusing. It seems likely that data are for calendar years through 1873; and for fiscal years, 1874-1880. The *Report of the Director of the Mint Upon the Production of the Precious Metals of the United States During the Calendar Year 1884*, p. 483; *Mineral Resources*, 1882, p. 183; and Tenth Census Reports (1880), vol. XIII, *Statistics and Technology of the Precious Metals*, p. 377, all label the figures to 1880 as fiscal years; late Mint reports specify calendar years for all years. However, close examination of these source volumes and reference to the various annual reports of Rossiter W. Raymond, United States Commissioner of Mining Statistics (last report was that for 1876), makes it appear that figures for 1848-1873 are for calendar years and that the data for 1874-1880 are for fiscal years. The 1884 Mint report on precious metals (p. 382) provides an added item of \$25,000,000 in gold for the last half of calendar year 1880. This addition is not allowed for in Mint reports of recent years, nor is any deduction item available for the probable change from calendar to fiscal years beginning in 1874.

Another point of uncertainty is the relationship between quantity and value series for both gold and silver. There seems to be some question as to whether the original series for early years may not have been in dollars and the ounce figures obtained at a later date by use of a conversion factor, rather than the other way around.

A few early sources of gold and silver figures may be mentioned. A published original source for the exact Raymond figures, 1792-1873, which comprise the start of the present series, has not been located. However, for various figures by Raymond, see Raymond's last report (U. S. Treasury Department, *Statistics of Mines and Mining in the States and Territories West of the Rocky Mountains* [1876], being the *Eighth Annual Report of Rossiter W. Raymond, United States Commissioner of Mining Statistics*), pp. 377 and 454; Eleventh Census Reports (1890), *Report on Mineral Industries in the United States at the Eleventh Census: 1890*, p. 40 ff; and Department of the Interior, U. S. Geological Survey, *Mineral Resources of the United States* [1882], p. 182. An overlap of Raymond's series and that of the Director of the Mint is shown on p. 482 of the Mint precious metals report for 1884.

Those interested will find alternative series for early years and discussion of the estimating problem in *Mineral Resources of the United States* [1882], and in the Eleventh Census Report (1890), *Mineral Statistics*, among other volumes. The figures of "Professor

Whitney," whose work is frequently cited, will be found in Whitney, J. D., *The Metallic Wealth of the United States*, Philadelphia, 1853. The "Mr. Valentine," also frequently cited, is John J. Valentine, vice-president and general manager (in 1890) of the Wells-Fargo Express Company, who published annual data on production in States and Territories west of the Missouri River.

**G 118-119. Gold production and value, 1792-1945.** SOURCE: For figures for 1792-1903, except annual data for 1835-1844, see U. S. Treasury, *Annual Report of the Director of the Mint*, 1910, p. 99. For annual figures for 1835-1844, see Bureau of Mines, Economic Paper 5, *Summarized Data of Gold Production*, p. 14. For 1904-1945, figures are from records of the Bureau of Mines. See also text for series G 118-121, above.

Quantities represent recoverable metal and are given in troy ounces, 1,000 fine. Gold is valued in 1934 and thereafter at \$35 per fine ounce; prior thereto at \$20.67+ per fine ounce.

Economic Paper 5, of the Bureau of Mines (cited above), provides quantity figures annually, 1835-1927, but the annual figures for 1904-1927 differ from those shown here. In addition, 10-year totals in fine ounces for 1801-1840 are provided as follows: 1801-1810, 135,000; 1811-1820, 135,000; 1821-1830, 150,000; 1831-1840, 318,000.

The Bureau of the Mint series, used here to 1903, is continued to 1945 in the issues of the *Annual Report of the Bureau of the Mint*. For single year data (Mint series), 1845-1909, see 1910 issue; for 1911-1940, see 1941 issue; for later years see subsequent issues.

In any comparisons of data in the gold and silver series, 1904-1945, with those in the annual *Mineral Resources—Minerals Yearbook* volumes, special care should be taken to refer to figures in those volumes which are specifically noted as *excluding* data for the Philippines, Puerto Rico, and island possessions.

**G 120-121. Silver production and value, 1834-1945.** SOURCE: Same as for series G 118-119, except for annual figures for silver, 1834-1844, see Bureau of Mines, Economic Paper 8, *Summarized Data on Silver Production*, p. 18. See also general text for series G 118-121, above.

Quantities represent recoverable metal and are given in troy ounces, 1,000 fine. Prices are the New York buying prices except for those years when the United States Treasury was purchasing silver under legislation providing a special price for domestically produced metal. In these years, the price is the treasury purchase price, despite the fact that some silver lacking affidavits regarding its production failed to qualify and entered the market at the commercial price. These latter quantities, however, have been negligible.

Economic Paper 8, of the Bureau of Mines (cited above), provides quantity figures annually, 1834-1927, but the annual figures for 1904-1927 differ from those shown here.

The Bureau of the Mint series, used here to 1903, is continued to 1945 in the issues of the *Annual Report of the Bureau of the Mint*. For single year data (Mint series), 1845-1909, see 1910 issue; for 1911-1940, see 1941 issue; for later years see subsequent issues.

In any comparisons of data in the gold and silver series, 1904-1945, with those in the annual *Mineral Resources—Minerals Yearbook* volumes, special care should be taken to refer to figures in those volumes which are specifically noted as *excluding* data for the Philippines, Puerto Rico, and island possessions.

**G 122-124. Platinum, 1880-1945.** SOURCE: See general note, series G 1-158. Figures for 1880-1900 and 1910-1920 represent crude platinum metals. Those for 1901-1909 represent production of refined platinum metals from domestic ores. Figures for 1921-1945 comprise production of crude platinum metals and platinum metals recovered as a byproduct of gold and copper refining. Figures on recoveries of platinum metals from gold and copper refining are not available prior to 1921. Data include Alaska.

**G 125-130. Light-weight metals, production and value, 1885-1945.** SOURCE: See general note, series G 1-158, and detailed listings below.

**G 125-126. Primary aluminum production, 1885-1945.** SOURCE: See general note, series G 1-158. Value data for 1893-1910 represent estimates. Production data for 1893-1906 cover fiscal year ending August 31.

**G 127-128. Bauxite production, 1889-1945.** SOURCE: See general note, series G 1-158. Production data represent shipments of crude, dried, activated and calcined bauxite from mines except for 1939-1945 which represent shipments of crude ore from mines. Figures on a dried equivalent basis are available from 1920 in source volumes.

**G 129-130. Primary magnesium production, 1915-1945.** SOURCE: See general note, series G 1-158; see also *Minerals Yearbook*, 1939 and subsequent annual volumes. Production figures represent sales. Data shown for 1922-1924 are estimates.

#### EMPLOYMENT AND INJURIES (G 131-158)

**G 131-143. Employment and injuries: Mines (except coal) and quarries, and related industries, 1911-1945.** SOURCE: See general note, series G 1-158, and detailed listings below.

**G 131-136. Employment and injuries, all mines except coal mines, 1911-1945.** SOURCE: See general note, series G 1-158; for 1911-1942, see *Bulletin 461*, "Metal- and Nonmetal-Mine Accidents in the United States—1942," 1945, p. 51; for 1943-1945, see annual volumes of *Minerals Yearbook* for 1945 and 1946, except for series G 134 and G 136, data for which were obtained from records of the Bureau of Mines.

**G 137-143. Employment and injuries, quarries and related industries, 1911-1945.** SOURCE: See general note, series G 1-158; for 1911-1942, see *Bulletin 458*, "Quarry Accidents in the U. S., 1942," 1944, p. 83; for 1943-1945, see annual volumes of *Minerals Yearbook* for 1945 and 1946. Man-hours of employment (series G 139) for the period 1911-1923 were computed on the assumption that weighted average length of workday was 9.36 hours as shown by reports from representative companies for 1924. Figures for injured per million man-hours (series G 143) for years previous to 1916 are believed to be not representative owing to probable incompleteness of reports of slight or minor injuries.

**G 144-158. Fatalities, production and employment: Bituminous and anthracite mines, 1870-1945.** SOURCE: See general note, series G 1-158, and detailed listing below.

**G 144-153. Number killed in coal mines (bituminous and anthracite, combined), 1870-1945.** SOURCE: See general note, series G 1-158; for 1870-1942, see *Bulletin 462*, "Coal Mine Accidents in the United States: 1942," pp. 102-104; for 1943-1945, see annual volumes of *Minerals Yearbook* for 1945 and 1946, except for series G 147, G 149, G 150, G 152, and G 153, data for which were obtained from records of the Bureau of Mines. Prior to 1910, certain States did not maintain records of accidents. Rates shown are based exclusively on tonnage and men employed in States for which accident records were available.

**G 154-158. Production and employment in coal mines, 1911-1945.** SOURCE: Same as for series G 144-153.

These data are based on monthly reports by coal mine operators to the U. S. Bureau of Mines. Total production figures (series G 154) for 1935-1944 represent annual totals of data received monthly, and they differ from combined totals for bituminous and anthracite production collected annually and presented as series G 13 and G 16, respectively.

#### Power: Series G 159-233

##### ENERGY PRODUCTION AND USE (G 159-199)

**G 159-170. Annual supply of energy from mineral fuels and water power, 1819-1945.** SOURCES: For decennial data 1819-1889, see U. S. Department of Commerce, Bureau of Mines, *Mineral Resources of the United States*, 1930, part II—Nonmetals, table 7,

p. 623; for annual averages of 5-year periods 1871-1900, see *Statistical Abstract*, 1946, table 526, p. 473; for 1899-1945, see U. S. Department of the Interior, Bureau of Mines, annual volumes of *Minerals Yearbook* as follows: For 1899-1935, see 1937 volume, table 8, p. 807; for 1936-1943, see 1945 volume, p. 846; for 1944-1945, revised data obtained from records of Bureau of Mines.

In converting water power to its fuel equivalent, two alternative assumptions have been made. The first (series G 161) assumes a *constant* fuel equivalent, which represents the average efficiency of all central stations generating steam-electric power in 1913, the base period used. The usefulness of the *constant* factor lies in showing the rate at which water power is being developed. It permits direct comparison between the relative increase in kilowatt-hours of water power and the corresponding increase or decrease in tons of coal, barrels of oil, or cubic feet of gas produced. On the other hand the *constant* factor makes no allowance for the fact that coal and other fuels produced today are used more efficiently than formerly.

To show the influence of improving fuel efficiency, a second computation (series G 162) of the energy equivalent of water power has therefore been made. This assumes a *prevailing* fuel equivalent, diminishing year by year, which represents the average performance of all fuel-burning central electric stations for the year in question. (The *prevailing* factor is thus much above the *constant* factor in 1899 and much below it in 1945.) The *prevailing* fuel equivalent indicates more nearly the quantity of fuel that would have been needed in any one year to generate the same power in a steam-electric station. It should be noted, however, that the ultimate uses to which the water power generated is put often displace fuel burned much less efficiently than in central stations and that in any instance no other important branch of fuel consumption has made advances in fuel efficiency approaching that of the central stations.

The ideal factor for converting water power into fuel equivalent would be the average efficiency of all forms of fuel consumption in each year. No basis for determining such an all-embracing average exists at present, but enough is known to make certain that it would show much less reduction from 1899 to 1945 than do the central stations. A just comparison of the changing contributions of water power and of fuel to the national energy supply would lie somewhere between the results shown by the *constant* equivalent and the *prevailing* central-station equivalent.

The figures for oil and natural gas represent the entire production of crude petroleum and of gas. Most of this production does not come into direct competition with coal. An elaborate analysis and the accumulation of data not now available would be required to determine even approximately how much of any one fuel actually has been displaced either by other fuels or by water power. The present series do not permit determination of such displacement; their purpose is rather to measure the long-time trends in the total demand for energy.

**G 171-233. General note. Production and use of electric energy, 1902-1945.** SOURCE: See detailed listings below. Some data on the production and use of electric energy are available since the beginning of commercial production in 1882. Data for the years 1882 to 1920, however, are difficult to evaluate because of changing bases of measurements and variations in coverage of the various censuses or other surveys made during the period. The Census Bureau published the results of surveys of the electric light and power industries made at five-year intervals during the period 1902-1937, and the Censuses of Manufactures and of Mineral Industries contain important data on industrial use and production of electric energy. The United States Geological Survey, the *Electrical World* and the National Electric Light Association also published considerable data applicable to the industry during this early period.

The chief gaps in the data for these years are in the production

of electric energy by industrial establishments for their own use and in the measurement of the sales by electric railroads and railroads for public distribution. Early data on capacity and on requirements must be converted from horsepower to kw. (kilowatts) to be comparable; and capacity data in kv.-a (kilovolt-amperes) were often tabulated as kw. without regard to the power factor. Data on generation were also often reported without regard to the kw.-h. (kilowatt-hours) used in production and, in many instances, where the prime mover was used both for direct drive and for electric generation, the kw.-h. equivalent of power used directly was reported as generation. These variations in units of measurement and in classification often resulted in differences in reported totals of as much as 20 to 25 percent. In presenting historical data on electric energy since 1902, efforts have been made to resolve such differences and place the data on a comparable basis.

Since 1920 comprehensive statistics on capacity and generation of electric utilities for public use have been compiled and published by the Geological Survey, 1920 to 1936, and by the Federal Power Commission, 1936 to 1945. Data on capacity and generation by nonutility establishments from 1939 to 1945 have been compiled and published by the Federal Power Commission. The Commission also published financial, operating, sales, and rate statistics for the electric utility industry. Data on customers, revenues, sales, and related matters for the period 1926 to 1945 are published by the Edison Electric Institute. The technical and trade journals from time to time publish data on the electric utility and related industries.

**G 171-174. Electric energy production by electric utilities and industrial establishments, by type of prime mover, 1902-1945.** SOURCE: Sum of data in series G 175-182 (electric utilities and industrial establishments). See also text for series G 171-233, above.

**G 175-178. Electric energy production by electric utilities, by type of prime mover, 1902-1945.** SOURCE: For 1902-1917, see Bureau of the Census reports, *Census of Electric Light and Power Stations*; for 1920-1945, see Federal Power Commission, *Production of Electric Energy and Capacity of Generating Plants*, 1945. See also text for series G 171-233, above.

**G 179-182. Electric energy production by industrial establishments, by type of prime mover, 1902-1945.** SOURCES: Federal Power Commission. Data for 1902-1938 based on Bureau of the Census, *Census of Manufactures*, *Census of Mineral Industries*, *Census of Electric Light and Power Stations*, and related data; data for 1939-1945, Federal Power Commission, *Industrial Electric Power Requirements, 1939-1945*. See also text for series G 171-233, above.

**G 183. Total utility and industrial electric energy production, 1902-1945.** SOURCE: Sum of series G 184 and G 190.

**G 184-189. Electric utilities electric energy production by class of ownership, 1902-1945.** SOURCE: See above for series G 175-178.

**G 190. Electrical energy production by industrial establishments, 1902-1945.** SOURCE: See above for series G 179. This series is identical to series G 179 and is repeated here for convenience in reference.

**G 191-193. Industrial use of electric energy, 1902-1945.** SOURCE: Federal Power Commission. Data for 1902-1938 based on Bureau of the Census, *Census of Manufactures*, *Census of Mineral Industries*, and related data; data for 1939-1945, Federal Power Commission, *Industrial Electric Power Requirements, 1939-1945*. See also text for series G 171-233, above.

**G 194-199. Consumption of fuels by electric utilities for production of electric energy, 1920-1945.** SOURCE: Federal Power Commission, *Consumption of Fuel for the Production of Electric Energy, 1945*.

#### GENERATING PLANTS AND CAPACITY (G 200-224)

**G 200-203. Number of electric utility generating plants, 1902-1945.** SOURCE: Federal Power Commission records.

G 204. Production per kilowatt of installed generating capacity, 1902-1945. SOURCE: Federal Power Commission records.

G 205-208. Installed generating capacity of electric utilities and industrial establishments, by type of prime mover, 1902-1945. SOURCE: Sum of data for series G 209-216 (electric utilities and industrial establishments).

G 209-212. Installed generating capacity of electric utilities, by type of prime mover, 1902-1945. SOURCE: Same as series G 175-178, above. These data include capacity of small standby plants which operate infrequently and have insignificant production, and capacity of publicly owned "Non-Central Stations" which operate primarily for such functions as public street lighting or water pumping.

G 213-216. Installed generating capacity of industrial establishments, by type of prime mover, 1902-1945. SOURCE: Same as series G 179-182, above.

G 217. Total utility and industrial installed generating capacity, 1902-1945. SOURCE: Sum of series G 218 and G 224.

G 218-223. Electric utilities installed generating capacity by class of ownership, 1902-1945. SOURCE: Same as series G 175-178, above.

G 224. Installed generating capacity by industrial establishments, 1902-1945. SOURCE: See above for series G 213. This series is identical to series G 213 and is repeated here for convenience in reference.

#### SALES TO ULTIMATE CONSUMERS (G 225-233)

G 225-233. Electric utilities, sales to ultimate consumers, 1902-1945. SOURCES: For 1902-1925, see Federal Power Commission records, based on data in Bureau of the Census, *Census of Electric Light and Power Stations*, National Electric Light Association Proceedings, *Electric World*, and related sources; for 1926-1945, see Edison Electric Institute, *Statistical Bulletin*.

<sup>1</sup> Includes some "bootleg" coal purchased by legitimate operators and prepared at their breakers. For statistics of "bootleg" operations in Pennsylvania anthracite industry, see *Minerals Yearbook*, 1945, p. 932. During the 5-year period, 1941-

1945, it is estimated that a total of 14,502,424 net tons of "bootleg" anthracite was produced, of which 6,552,121 net tons was purchased for preparation by recognized operators.

## Series G 19-32.—FUELS—BITUMINOUS COAL AND LIGNITE MINING: 1890 TO 1945

[Net tons are of 2,000 pounds. For production data prior to 1890, see page 142. See also series G 14-15]

YEAR	Production (net tons)	Men em- ployed	Number of mines	CALCULATED CAPACITY (MILLIONS OF NET TONS)			Average number of days worked	AVERAGE NUM- BER OF DAYS LOST ON ACCOUNT OF STRIKES		NET TONS PER MAN		PERCENT OF UNDERGROUND PRODUCTION		PERCENT OF TOTAL PRODUCTION	
				At 308 days	At 280 days	At 261 days		Per man em- ployed	Per man on strike	Per day	Per year	Cut by ma- chines	Me- chan- ically loaded	Me- chan- ically cleaned	Mined by strip- ping

<sup>1</sup> Includes some "bootleg" coal purchased by legitimate operators and prepared at their breakers.

<sup>3</sup> Data not available.

<sup>2</sup> As reported by the Commonwealth of Pennsylvania, Department of Mines.

## Series G 43-56.—FUELS—COKE INDUSTRY: 1880 TO 1945

[Net tons are of 2,000 pounds]

YEAR	PRODUCTION (MILLION NET TONS)				NUMBER OF OVENS			Coal charged (million net tons)	Yield of coke from coal (percent)	Average dollar value of coke per ton at plant	TOTAL VALUE OF PLANT (MILLIONS OF DOLLARS)			
	Total coke	Byproduct		Beehive coke	Byproduct						Total coke and by-products	Coke		All by-products
		Quantity	Percent of total coke		In existence	Under construction at end of year	Beehive, in existence					Beehive	Byproduct

<sup>1</sup> 1880-1911 data are for production.

<sup>2</sup> 1880-1927, value of products made from domestic crude gypsum; 1928-45, value of products made from domestic, imported, and byproduct crude gypsum.

<sup>3</sup> By commercial and government-and-contractor producers.

<sup>4</sup> Revised figures partly estimated, to make them comparable with 1937 and succeeding years.

<sup>5</sup> Estimated.

<sup>6</sup> Not available.

<sup>7</sup> Included under "Stone." Separate figures not available.

<sup>8</sup> Includes lime.

<sup>9</sup> Includes lime and slate.

## Series G 77-92.—NONMETALS—CHEMICAL AND FERTILIZER MATERIALS, AND MAGNESITE, PRODUCTION: 1880 TO 1945

[Short tons are of 2,000 pounds; long tons are of 2,240 pounds]

YEAR	CHEMICAL MATERIALS										FERTILIZER MATERIALS				MAGNESITE	
	Barite		Feldspar		Salt		Sulfur		Pyrites		Potash (K <sub>2</sub> O)		Phosphate rock		Crude, mined	Value

Series G 104-111.—METALS, ALLOYING—MANGANESE ORE, CHROMITE, TUNGSTEN, AND MOLYBDENUM, PRODUCTION: 1880 TO 1945

[ Long tons are of 2,240 pounds; short tons and net tons are of 2,000 pounds. Shipments of tungsten represent ore and concentrates, 60 percent WO<sub>3</sub>. Molybdenum quantity figures refer to pounds Mo in concentrates ]

<sup>1</sup> Shipments of crude ore from mines. Not comparable with previous figures.

<sup>2</sup> Bureau of Mines not at liberty to publish.

<sup>3</sup> Estimated.

<sup>4</sup> Fiscal year ending Aug. 31.

<sup>5</sup> September-December.

<sup>6</sup> Less than 500 lbs.

Series G 159-170.—POWER—ANNUAL SUPPLY OF ENERGY FROM MINERAL FUELS AND  
WATER POWER: 1819 TO 1945

In trillions of British thermal units. Unit heat values employed are: Anthracite, 13,600 B.t.u. per lb.; bituminous coal, 13,100 B.t.u. per lb.; petroleum, 6,000,000 B.t.u. per barrel; natural gas, 1,075 B.t.u. per cu. ft. Water power includes installations owned by manufacturing plants and mines, as well as Government and privately owned public utilities. The fuel equivalent of water power is calculated from the kilowatt-hours of power produced wherever available, as is true of all public-utility plants since 1919. Otherwise the fuel equivalent is calculated from the reported horse-power of installed water wheels, assuming a capacity factor of 20 percent for manufactures and mines and of 40 percent for public utilities.]

YEAR OR ANNUAL AVERAGE	GRAND TOTAL ENERGY		WATER POWER		MINERAL FUELS							
	With water power at constant fuel equivalent	With water power at prevailing central station equivalent	At constant fuel equivalent <sup>1</sup>	At prevail- ing central station <sup>2</sup>	Total mineral fuels	Coal			Petroleum and natural gas			
						Total coal	Bitumi- nous	Pennsyl- vania anthracite	Total petroleum and natural gas	Petroleum (total crude, includ- ing that refined)		Natural gas (total production)

<sup>1</sup> Assuming 4.02 pounds of coal per kilowatt-hour, which is the average of central electric station practice in 1913, the base period used.

<sup>2</sup> Assuming the average central-station practice for each of the years for which data are available, which declined from about 7.05 pounds of coal per kilowatt-hour in 1899 to 1.30 pounds in 1945.

<sup>3</sup> Does not include an unknown amount of bootleg or stolen coal. If this were included, the energy for anthracite would be increased approximately 109 trillion

B.t.u. in 1935 and 1936 respectively, and the total energy would be increased accordingly.

<sup>4</sup> Imports negligible.

<sup>5</sup> Based on amount of coal displaced by gas as estimated by gas companies at the time.

<sup>6</sup> Less than 0.5.

<sup>1</sup> Includes electric railroads and railways. Does not include generation by non-utility plants of less than 100 kw capacity or by plants in hotels, apartment houses, office buildings, or other commercial establishments. In 1927 the total of such generation was approximately 1½ percent of the total generation of utility

and non utility establishments. The relative total of the generation excluded has declined materially since 1927.

<sup>2</sup> Municipal class assumed to comprise total publicly owned group.

1902	650,000	2,200,000	86,500,000						

<sup>1</sup> Includes rural under distinct rural rates, street and highway lighting, other public authorities, railways and railroads, and interdepartmental, as well as residential, commercial, and industrial consumers. Federal Power Commission data for 1945 shows customers, 34,330,464; kilowatt-hours (thousands), 196,437,748; and revenues, \$3,354,463,572. Differences attributable primarily to coverage of publicly-owned systems.

## Chapter H. Construction and Housing (Series H 1-135)

### Construction: Series H 1-80

#### CONSTRUCTION EXPENDITURES (H 1-39)

**H 1-25. General note. Construction expenditures, estimated dollar volume, 1915-1945.** SOURCE: Bureau of Foreign and Domestic Commerce, *Industry Report on Construction and Construction Materials, Statistical Supplement*, "Construction Volume & Costs, 1915-1947," May 1948. For 1939-1945, the estimates were developed jointly by the Department of Commerce and the Department of Labor. For 1920-1938, the estimates of private residential building (excluding farm) were compiled by the Department of Labor, Bureau of Labor Statistics. All other estimates for the period 1915-1938 were compiled by the Department of Commerce, Bureau of Foreign and Domestic Commerce, Construction Division. Detailed current estimates of construction volume appear monthly in the *Industry Report on Construction and Construction Materials*, published by the Bureau of Foreign and Domestic Commerce and in *Construction* issued by the Department of Labor.

These estimates represent the current value of construction work put in place during the year, including the value and cost of installation of equipment which is an integral part of a structure, but excluding costs for machinery and land. Since they are based upon work performed during the year, these estimates differ from building permit and contract award data which are indicative of the value of work started. (The value of *work started* represents the total estimated costs of projects begun in a given period. The value of *work put in place* represents the estimated expenditures on labor, materials, and overhead in a given period for projects, or parts thereof, on which construction work was in progress during the period, whether such projects were begun in a prior period or currently.)

The source publication comments as follows on the reliability of these data: "With minor exceptions, the data . . . are estimates . . . based on the best available primary data, adjusted as necessary to approximate a complete and comprehensive measure of over-all construction activity.

"The reliability of the estimates cannot be measured in mathematical terms. In general, however, it seems probable that the year-to-year changes in the figures for new construction are generally correct as to direction and at least approximately correct as to order of magnitude. The absolute level of the series is likely to be less exact than the year-to-year changes. . . .

"The figures for the federally financed public construction and the annual figures for most of the privately financed public utility construction would appear to be the most reliable portions of the estimates. The least reliable figures are those for maintenance and repair of nonfarm buildings, both residential and nonresidential, and the farm construction figures."

Following is a summary of the sources and methods developed and used in compiling the estimates for the chief types of construction. The emphasis is chiefly on current procedures, but the earlier sources and methods have been indicated briefly.

**H 1-3. Total, total new, and total new private construction, 1915-1945.** SOURCE: See general note, series H 1-25, and detailed listings below. Series H 1 represents summation of series H 2, 24, and 25; series H 2 represents summation of series H 3 and H 13; series H 3 represents summation of series H 4-5 and H 9-12.

**H 4. New private residential construction (excluding farm), 1915-1945.** SOURCE: See general note for series H 1-25. See also, for general reference, Housing and Home Finance Agency, *Housing Statistics Handbook*, 1948. Estimates of the dollar volume of new

private nonfarm residential building are derived directly from estimates of construction cost of new private nonfarm dwelling units (included in series H 46). For 1941-1945, the estimated construction cost for the units started each month is distributed according to a percentage pattern over the months during which actual construction work is estimated to occur, and then the distributed cost figures are totalled for each month. Estimates of construction time and the monthly pattern of expenditures outlay on residential building are made on the basis of the most recent field information about the average construction period and the extent of labor utilization each month on residential projects.

For 1921-1940, when monthly starts and construction cost data were not available, expenditures for residential building were derived from annual figures on construction costs, with only slight adjustment to include expenditures for units started before the beginning of the calendar year and to exclude expenditures for units started near the end of the year and not completed within the year. The 1915-1920 estimates are projected back from the 1921-1922 average by using link relatives indicated by year-to-year changes in the value of residential building contracts awarded as reported by F. W. Dodge Corporation. For a series beginning in 1900, see series H 47.

**H 5-8. New private nonresidential building, 1915-1945.** SOURCE: See general note for series H 1-25. Basic source is the record of contracts awarded as published by F. W. Dodge Corporation of New York, N. Y. (See text for series H 51-57.) Separate estimates were made for each of the following types of new private nonresidential buildings: Industrial; warehouses, office and loft buildings; stores, restaurants, and garages; religious; educational; hotels; social and recreational; hospital and institutional; and miscellaneous. The estimates of construction activity were derived by adjustment of the contract data for geographic and other under-coverage, rescissions and duplication of construction reported by public utilities, and by conversion to a work put in place basis.

**H 9. Farm construction, 1915-1945.** SOURCE: See general note for series H 1-25. Annual estimates of farm construction and maintenance were made by the Bureau of Agricultural Economics, Department of Agriculture, and were first published in the Department of Agriculture study, *Income Parity for Agriculture*, part II, section 5, March 1941. Separate estimates were prepared for operators' dwellings and for service buildings, which correspond respectively to residential and nonresidential building. Since the source estimates include both new construction and maintenance, a break between the two has been computed by the Department of Commerce on the basis of estimates of farm consumption of lumber as prepared by the Forest Service, Department of Agriculture. Data shown here do not include maintenance.

**H 10. Railroads, including local transit, 1915-1945.** SOURCE: See general note for series H 1-25. For 1922-1945, the annual volumes of the *Statistics of Railways in the United States*, Interstate Commerce Commission, and the annual *Review of Railway Operations*, Bureau of Railway Economics, Association of American Railroads, provided the gross capital expenditures of Class I railroads for road and structure. Estimates of construction expenditures of all railroads were obtained by the upward adjustment of the data for Class I railroads on the basis of the total investment in road and structure of Class I railroads and of all railroads. The estimates for 1915-1921 are based on extrapolation of expenditures data on the basis of miles of new track added.

Annual data on capital and maintenance expenditures of the transit industry for 1922-1945 were obtained from the *Transit*

*Fact Book* published by the American Transit Association. The association made available data on the expenditures of municipally owned transit companies, so that by subtraction the expenditures of the privately owned companies were obtained. The estimates for 1915-1921 are based on extrapolation of expenditure data on the basis of miles of track added or rebuilt.

**H 11. Electric light and power, gas, and pipe lines, 1915-1945.** SOURCE: See general note for series H 1-25, above. For 1937-1945, annual additions to electric plants have been reported to the Federal Power Commission. The data were adjusted to include small companies not reporting and to allow for work in progress and existing property purchased. For 1921-1936, data from the Edison Electric Institute were used. The estimates for 1915-1920 are based on an estimated year-by-year distribution of the 5-year increments in plant and equipment derived from data reported in the Census of Electrical Industries, Bureau of the Census, for 1912, 1917, and 1922.

The American Gas Association has published annual data, 1929-1945, on construction expenditures for both the manufactured and the natural gas utility industries. The reported data were adjusted to eliminate equipment expenditures. For 1915-1928, estimates were obtained by extrapolation on the basis of year-to-year changes in the fixed capital accounts of 50 large companies.

Capital expenditures on pipe lines for 1919-1945 were obtained from the reports filed with the Interstate Commerce Commission. Adjustment was made for the purchase of existing lines and for expenditures by companies not required to file information with the Commission. Only a rough estimate by the Construction Division, Bureau of Foreign and Domestic Commerce, is available for 1915-1918.

**H 12. Telephone and telegraph, 1915-1945.** SOURCE: See general note for series H 1-25. Estimated construction expenditures of the telephone industry for 1915-1945 were obtained from the American Telephone and Telegraph Co. Construction expenditures of the telegraph industry were derived from capital expenditures reported by the Western Union Telegraph Co. for 1927-1945 and by the Postal Telegraph and Cable Co. for 1919-1943. Extrapolation back to 1915 was made on the basis of annual increments in the value of plant and equipment.

**H 13. Total new public construction, 1915-1945.** SOURCE: See general note, series H 1-25. These data represent summation of series H 14-15, 19-23.

**H 14. Public residential construction, 1918-1919, 1934-1945.** SOURCE: See general note for series H 1-25. For 1939-1945, public residential construction estimates have been based upon regular progress reports issued by the Federal Public Housing Authority and other public housing agencies listing the value of work put in place for individual projects. Adjustments were made to cover funds contributed to the Federal projects by local agencies. Expenditures by the United States Housing Corporation for 1918-1919, and by the Public Works Administration, Resettlement Administration and Alley Dwelling Authority from 1934, were compiled from the annual reports of these agencies.

**H 15-18. Public nonresidential building, 1915-1945.** SOURCE: See general note for series H 1-25. Estimates through 1941 are based on the F. W. Dodge Corp. reports of contracts awarded for public buildings. These reports are published in the *Dodge Statistical Research Service*, "Construction Contracts Awarded," New York, N. Y. From 1942 on, estimates were based on specially prepared construction progress reports furnished by Federal agencies, supplemented by contract award reports of the F. W. Dodge Corp. See also text for series H 51-57.

**H 19. Military and naval facilities, 1915-1945.** SOURCE: See general note for series H 1-25. For 1940-1945, construction expenditures of the War and Navy Departments are based upon engineers' progress reports issued by these agencies. Navy Department construction expenditures for 1915-1936 were derived from special tabulations of the Bureau of Supplies and Accounts,

United States Navy Department. Expenditures of the Navy for 1937-1939 and the War Department for 1915-1939 are based upon expenditures shown in the *Budget of the United States Government*.

**H 20. Highways, roads and streets, 1915-1945.** SOURCE: See general note for series H 1-25. For 1921-1945, construction estimates for State administered highways are based on annual reports of the Bureau of Public Roads, and are adjusted to include expenditures by county, municipal, and other local bodies. The adjustments are based upon ratios developed from the analysis of total highway construction and State highway construction. Estimates from 1915 to 1919 are derived from the 1920 Department of Agriculture *Yearbook*. The 1920 estimates are obtained by straight-line interpolation.

**H 21. Sewage disposal and water supply systems, 1915-1945.** SOURCE: See general note for series H 1-25. For 1915-1942, construction estimates are based upon data published annually in *Financial Statistics of Cities*, Bureau of Census. Using the expenditure patterns of the city size groups reporting, expenditure ratios were derived for the smaller municipalities and rural incorporated areas. For 1943-1945, estimates are based upon contracts awarded as reported by F. W. Dodge Corp. (see text for series H 15-18) with adjustments for undercoverage.

**H 22. Conservation and development, 1915-1945.** SOURCE: See general note for series H 1-25. For 1915-1942, expenditures for reclamation, improvement of rivers and harbors, and flood control work are derived from annual reports of the Army Chief of Engineers and the Commissioner of Reclamation. The fiscal-year basis of the reports are converted to calendar year by taking one-half of the figure for each fiscal year included within that calendar year. For 1943-1945, estimates are based upon project reports furnished by the Corps of Engineers and the Bureau of Reclamation. Tennessee Valley Authority expenditures are available in annual reports by the Authority. Bureau of Indian Affairs, Forest Service, National Park Service and Soil Conservation Service expenditures are derived from special tabulations prepared by those agencies, and from the *Budget of the United States Government*.

**H 23. Other public construction, 1915-1945.** SOURCE: See general note for series H 1-25. Construction expenditures of all Federal agencies not discussed above are derived from the *Budget of the United States Government*. Outlays for municipal public service enterprises are obtained directly from the municipality or estimated on the basis of information reported in *Financial Statistics of Cities*, Bureau of Census. Current miscellaneous non-Federal public construction estimates are derived primarily from reports of contracts awarded, compiled by the F. W. Dodge Corp., and from the *Engineering News-Record* and other publications reporting contract awards.

**H 24. Work relief, 1933-1943.** SOURCE: See general note for series H 1-25. From the total relief expenditures as given in annual reports of the Federal Work Projects Administration, deductions were made for nonconstruction expenditures, and for expenditures included under other categories of construction. Approximately half of the expenditures reported for public buildings and housing, and a third of the expenditures for public recreation facilities, were included in the estimates of new public nonresidential building; these amounts were excluded from the work-relief figures. For conservation work, work-relief figures include only the amounts expended for irrigation and water conservation. They also include all work-relief expenditures for highways, roads, streets, etc., electric utilities, water and sewage systems, and transportation systems.

**H 25. Maintenance and repairs, 1915-1945.** SOURCE: See general note for series H 1-25. Residential maintenance for nonfarm owner-occupied dwelling units is largely estimated on the basis of consumer expenditure surveys for 1935-1936 and 1941 by the Bureau of Labor Statistics, Department of Labor, and the Bureaus of Home Economics and Agricultural Economics, Department of Agriculture. Extrapolation throughout 1915-1940 was made on the

basis of variations in income per family, and since 1940 on the basis of retail sales of building materials.

Residential maintenance for nonfarm tenant-occupied dwelling units was largely estimated on the basis of surveys for 1939-1943 made by the Office of Price Administration in connection with rent control, and consumer purchases studies for 1935-1936 and 1941 by the Bureau of Home Economics and the Bureau of Agricultural Economics, Department of Agriculture. Extrapolation throughout 1915-1940 was made on the basis of income per family, and since 1940 on the basis of results of surveys of rental housing made by the Office of Price Administration.

Residential maintenance for vacant dwelling units not for sale or rent was considered to move in the same way as that for owner-occupied units, while maintenance for units vacant for sale or rent was considered to move in the same way as that for tenant-occupied units.

For further discussion of nonfarm residential maintenance see: Stephan, Frieda J., and Palmer, J. Joseph, *The Pattern of Expenditures for Nonfarm Residential Repair and Maintenance*, Economic Series No. 55, Bureau of Foreign and Domestic Commerce, Department of Commerce, 1946.

Nonresidential building maintenance was estimated on the basis of the application of maintenance ratios to the total value of nonresidential properties using the estimate of such total value made by the Federal Trade Commission for 1922 and using rough estimates for other years. After 1938, the 1938 total value estimate was used, conversion to current values being made on the basis of the wholesale price index for building materials prepared by the Bureau of Labor Statistics, Department of Labor.

Other maintenance has been estimated from the same sources as was new construction. See text for series H 9-12 and H 15-23.

**H 26. Total new construction, 1939 prices, 1915-1945.** SOURCE: Bureau of Foreign and Domestic Commerce, *Industry Report on Construction and Construction Materials, Statistical Supplement*, May 1948. Measurement of construction activity in constant prices is an indirect way of approximating changes in the physical volume of construction. The present estimates are based on a deflation of each type of construction by an appropriate construction cost index, a procedure required by the almost complete lack of direct measures of physical volume comparable over time, and by the lack of a single construction cost index applicable to total new construction.

A discussion of the cost indexes used for each type of construction is found in the *Industry Report on Construction and Construction Materials*, September 1946, pages 35-40, Bureau of Foreign and Domestic Commerce. The *Statistical Supplement* to the May 1948 issue of the same publication contains a classification by types of construction.

**H 27-32. Federal expenditures for public works, 1791-1919.** SOURCE: Compiled by Department of Treasury from Treasury records and statements at the request of the Federal Works Agency. These data comprise construction and repair as defined in the note for series H 33-35.

**H 33-35. Expenditures for public works by permanent federal construction agencies, 1920-1939.** SOURCE: Federal Works Agency. These data comprise expenditures from regular appropriations, emergency funds, and in three instances (Inland Waterways Corporation, Panama Railroad Co., and Panama Railroad Steamship Line) expenditures from corporation revenue. The information was obtained by special questionnaires to the various Federal agencies. In the instructions "construction" was defined to comprise the erection of any new structural or nonstructural improvement to land, ships and floating equipment, additions to and complete replacement of existing works. "Repair" comprises work necessary for the restoration and preservation of structures, nonstructural improvements to maintain land and floating equipment in a sound and serviceable condition, and minor alterations.

**H 36-39. Construction expenditures, estimates for new construction, 1869-1938 (by decades).** SOURCE: Kuznets, Simon, *National Product Since 1869*, National Bureau of Economic Research, 1946, p. 99. Series H 36-37 is based on estimated consumption of construction materials and its calculated relationship to new construction, whereas series H 38-39 is based on various Department of Commerce estimates derived from building permit, construction contract, and other data; the estimates of the latter series have been superseded by revised estimates presented in series H 1-25.

**H 36-37. New construction expenditures, based on materials output, 1869-1938 (by decades).** SOURCE: See note, series H 36-39, above. While estimates of construction expenditures based upon more direct measures of construction activity will generally be preferred, estimates derived from the output of construction materials may be carried back through a considerable period. These estimates are derived from data on the output of construction materials destined for domestic consumption as prepared by William H. Shaw for the years 1869, 1879, and 1889-1938 (see series H 49 and H 50). Interpolation between the census years 1869, 1879, and 1889 was made on the basis of sample data. The output value figure was increased to cover transportation and distribution costs by the use of a factor 1.4576, based on 1929 data. A relatively small adjustment for inventory changes was made after which a measure of total new construction was obtained by the use of a factor 1.4036, based on the 1919-1933 relation between new construction and the cost of materials consumed. The computations were in terms of values expressed in constant prices, so to obtain values in current prices, a construction cost index based on a weighted average of building materials prices and building wage rates was used (see Kuznets, *National Product Since 1869*, p. 216).

**H 38-39. New construction expenditures, based on building permit, contract, and other data, 1909-1938 (by decades).** SOURCE: See note, series H 36-39, above. For purposes of comparison with the more direct measure of new construction activity, the averages of annual estimates of the latter type are given for overlapping decades for 1914-1938, the figures being based on estimates by the Construction Division, Bureau of Foreign and Domestic Commerce, Department of Commerce, made somewhat earlier than the estimates given in series H 1-25.

#### DWELLING UNITS STARTED AND DEMOLISHED (H 40-48)

**H 40-47. General note. Dwelling units started in nonfarm areas: Number, cost, and value, 1900-1945.** SOURCES: Number of new units started: For 1900-1919, see The Twentieth Century Fund, *American Housing*, 1944, p. 364, which also gives figures through 1941; for 1920-1929, see Wickens, David L., and Foster, Ray R., *Nonfarm Residential Construction, 1920-1936*, National Bureau of Economic Research, Bulletin 65, 1937; for 1930-1943, see Bureau of Labor Statistics, *The Construction Industry in the United States*, Bulletin No. 786, which gives figures for 1920-1943; for 1944-1945, see Bureau of Labor Statistics, monthly releases. Data for construction cost of new units (series H 46) were provided by the Bureau of Labor Statistics; see also Housing and Home Finance Agency, *Housing Statistics Handbook*, 1948, table 14, p. 17. For total value of new nonfarm residential construction, see detailed listing for series H 47.

The Bureau of Labor Statistics' estimates of new dwelling units started and of the construction cost of new units are based primarily on reports of local building permits issued. (For indexes of building permits issued, see series H 74-79.) A permit to build is required in practically all urban and in many rural-nonfarm places. The size and the builder's estimate of the cost of the proposed structure are usually recorded on these permits, thereby providing an indication of the volume of building to be carried on in the locality. The Bureau of Labor Statistics began collecting summaries of building-permit records in 1920. During that year, information was collected from 207 cities having a population of

35,000 or over. The Bureau now (1947) receives summaries of building-permit records from over 2,500 cities, 1,700 rural incorporated places and about 350 unincorporated areas, that is, from practically every place that requires a permit to build.

The dwelling units covered in this series are housekeeping units in new structures. Units provided by conversion of existing structures at the original site, or nonhousekeeping units such as those in dormitories, barracks, rooming houses, or hotels are excluded.

**H 40. Total new dwelling units started in nonfarm areas, 1900-1945.** SOURCE: See general note for series H 40-47, above. Figures shown here for 1910-1919 are estimates of the Twentieth Century Fund and differ considerably from Bureau of Labor Statistics estimates for the same period; the BLS estimates appear in *Bulletin 786* mentioned in the text for series H 40-47. The Fund estimates were used here because, in addition to presenting the total of new dwelling units started, the total data are shown in detail for urban and rural dwellings started and for construction cost of new units.

**H 41. New urban units started, 1900-1945.** SOURCE: See general note for series H 40-47, above. The term *urban* is applied to all incorporated places with a population of 2,500 or more in 1940, and, by special rule, to a small number of unincorporated civil divisions. To derive the urban estimate, the cities reporting building-permit data to the Bureau of Labor Statistics are arrayed by State, population size group and whether inside or outside a metropolitan district; the volume and value of residential building during the month is summarized for each class of place. The estimate for all urban areas in the country is prepared by applying to the volume of housing reported for each type of place, the ratio of the total number of such places in the country to the number reporting that month.

Figures for publicly financed urban units are based on actual enumerations rather than estimates. The number and location of publicly financed units started are reported to the Bureau monthly by the agencies awarding the contracts or performing the work, and are added to the estimates for privately financed units to obtain a total of all urban housing started during the month.

**H 42. New rural-nonfarm housing started, 1900-1945.** SOURCE: For 1920-1929, see Wickens and Foster, *Nonfarm Residential Construction*; for 1900-1919, see *American Housing*, p. 364. Also see discussion on p. 363, *American Housing*. See also note for series H 40-47, above.

Rural-nonfarm housing covers all housing (except farm housing) in unincorporated areas and in incorporated places of less than 2,500 inhabitants. Thus, urban housing is classified by location (see text for series H 41, above), whereas rural-nonfarm and farm housing are classified according to the intended use of the structure.

**H 43-45. New dwelling units started, by type, 1920-1945.** SOURCE: For 1920-1929, see Wickens, David L. and Foster, Ray R., *Nonfarm Residential Construction, 1920-1936*, National Bureau of Economic Research, *Bulletin 65*, 1937; for 1930-1943, see Bureau of Labor Statistics, *The Construction Industry in the United States*, *Bulletin No. 786*; for 1944-1945, see Bureau of Labor Statistics, monthly releases. See also general note for series H 40-47 above.

**H 46. Construction cost of new units, 1920-1945.** SOURCE: See general note for series H 40-47, above. Estimates of construction cost are based on data from building-permit reports, adjusted for nonreporting places and for the cost of building in non-permit-issuing places. Starting with 1930, adjustments were made to compensate for the understatement of construction cost inherent in permit valuations. In 1945 allowances were made for lapse in building permits and lag between permit issuance and start of construction. Series H 4 and H 14 are derived directly from this series. (For indexes of building permits, see series H 74-79.)

Construction cost includes the cost of labor, materials and subcontracted work and contractor's overhead and profit, but excludes land and development costs and speculative profits.

**H 47. Expenditures for new nonfarm residential construction, 1900-1918.** SOURCE: Chawner, Lowell J., *Residential Building*, Housing Monograph Series No. 1, National Resources Committee, 1939, p. 13, table V. These data are intended to supplement series H 4 and H 14, which covers the period 1915-1945. The present series originally covered the period 1900-1937, but the figures for the later years have been superseded by those in series H 4 and H 14. The method of estimation is described in part in Chawner, Lowell J., *Construction Activity in the United States, 1915-1937*, Domestic Commerce Series No. 99, Bureau of Foreign and Domestic Commerce, Department of Commerce, 1938, pp. 9-10 and 38-45. The volume of public residential construction, reported for 1918 only, was compiled directly from the reported expenditures of the public agencies concerned. Private residential construction was estimated on the basis of contract award data as reported by the F. W. Dodge Corporation, building permits in representative cities, the estimated number of new dwelling units added each year, construction cost indexes, and other information.

**H 48. Number of nonfarm dwelling units demolished per decade, 1890-1939.** SOURCE: 1890-1929, Wickens, David L., *Residential Real Estate*, National Bureau of Economic Research, 1941, p. 54; 1930-1939, Naigles, M. H., "Housing and the Increase in Population," *Monthly Labor Review*, April 1942, p. 880. The figures for 1900-1939 appear in The Twentieth Century Fund, *American Housing*, 1944, p. 410. The estimates include not only voluntary demolitions but also demolitions and losses resulting from fire, explosion, flood, windstorm, earthquake and other causes.

The estimates for 1930-1939 are based in part on demolition permit reports to the Bureau of Labor Statistics. Fire losses resulting in complete destruction of dwellings were estimated from figures published by the National Board of Fire Underwriters. Also included were losses of dwellings during disasters, as reported by the American Red Cross, undercoverage being assumed balanced by overlapping of the permit coverage.

The estimates for 1920-1929 are based on demolition permit data, fire losses reported by the National Board of Fire Underwriters, and allowance for losses due to floods, earthquakes, windstorms, and other causes. The proportion of reported fire losses assumed to represent total loss of dwellings was estimated on the basis of data for seven States for 1930.

The estimates for 1890-1919 are derived chiefly from fire loss data for all types of property and extrapolation of the 1920-1929 demolition permit data, assuming smaller rates of voluntary demolition prior to 1920.

#### MATERIALS OUTPUT, CONTRACTS AWARDED, AND CAPITAL OUTLAYS (H 49-63)

**H 49-50. Value of output of construction materials destined for domestic consumption, 1869-1939.** SOURCE: Shaw, William H., *Value of Commodity Output Since 1869*, National Bureau of Economic Research, 1947, pp. 64, 65, 69, 76, 77. The estimates are based upon a study of the successive Censuses of Manufactures and annual reports of the Bureau of Mines and the Department of Agriculture, supplemented by State and other fragmentary data. Imports were added and exports deducted to yield the output available for domestic use. Data on wholesale prices from various sources were used in order to develop a price index with which to convert current values into 1913 values.

The estimates are in terms of producers' values and do not allow for transportation or distribution costs. No allowance is made for flow into or out of inventories held by producers, distributors, or consumers. Hence, the estimates are a measure of the amounts available at the production level rather than the amounts actually consumed. No distinction is made between amounts destined for consumption in new construction and amounts destined for consumption in repairs and maintenance.

**H 51-57. Construction contracts awarded, 1925-1945.** SOURCE: F. W. Dodge Corporation, New York, N. Y. Figures are published

currently in considerably greater detail in *Dodge Statistical Research Service* (monthly). See also Bureau of the Census, *Statistical Abstract of the United States*, 1946, p. 770, for figures in somewhat greater detail than shown here.

The present series of contract award data is prepared monthly by a staff of reporters throughout the 37 Eastern States who contact owners, architects, engineers, contractors, financial institutions, real estate brokers, and others able to supply reliable information on the awarding of construction contracts. Small projects, especially noncontract construction, for example, work done by a firm's own force, are less completely covered. The F. W. Dodge Corp. has provided the following descriptive statement for its series after 1925:

Contract awarded statistics compiled by F. W. Dodge Corp. are based upon project news reports gathered daily by the corporation's field staff operating in the 37 States east of the Rocky Mountains. The figures are factual since they contain no estimates beyond the range of the field coverage. The figures include new construction, additions and alterations. No maintenance work is included. No shipbuilding is included. A negligible volume of farm building is included. Force-account work is generally included, except when executed with mass-purchased materials not earmarked for specific projects at time of purchase. Generally speaking, the figures are considered to be more nearly comprehensive in the field of non-residential buildings than in residential building. In the category of residential buildings, coverage of multiple dwellings is considered to be reasonably complete for the territory; coverage of development projects of one- and two-family houses is also reasonably complete; principal deficiency in coverage is in one-family houses erected singly, particularly in low valuations and in small communities.

The eleven Western States not covered are: Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California. The District of Columbia is included in the covered area.

For monthly figures, 1925-1945 for 37 States, and 1910-1925 for 27 States, see series App. 22, appendix I.

**H 58-63. Capital outlays in 145 municipalities, 1900-1937.** SOURCE: Wolkind, Harold, *Fluctuations in Capital Outlays of Municipalities*, Bureau of Foreign and Domestic Commerce, Economic Series No. 10, 1941, pp. 8 and 11. The capital outlays of municipalities include the cost of land and other properties and public improvements more or less permanent in character, which are owned and used by municipalities in the exercise of their municipal functions or in connection with the business undertakings conducted by them. These outlays embrace all payments for the purchase and improvement of land; the erection of new buildings; the installation and extension of water-supply systems, sewerage systems, electric light systems and other enterprises; the purchase of apparatus for the fire and police departments; purchases for collections of libraries, museums, and art galleries; and all other acquisitions which add to the number and value of the permanent possessions of the municipalities.

Expenditures which merely put an existing piece of property or equipment in a condition not better than its condition at the time of its original construction or acquisition are considered as repairs and so are excluded from capital outlays.

The acquisition by a municipality of privately owned facilities is customarily included with other capital outlays of municipalities although such expenditures do not result in additions to the total stock of such facilities within the community.

The present data are based on the outlay data compiled by the Bureau of the Census and published for each year in the *Financial Statistics of Cities*, which cover the years 1902-1937, and Department of Labor reports covering the years 1900-1901.

For 1900-1901, the reports covered 124 cities; for 1920 the coverage was 107 cities and for 1932-1937 the coverage was 83 cities. The data for each of these years were increased to yield estimated totals comparable to those for the full 145 cities covered in other years. No data were available for 1913, 1919, and 1921.

Allowance was made for the wide variation in the dates of closing of the fiscal year, for changes in the area incorporated within each city, for expenditures by divisions of government other than the city corporation, and where possible for noncapital outlays included in the data. For the period 1933-1937, Federal work relief expenditures could not be entirely separated from municipal outlays.

The per capita outlay data (series H 63) are computed from the total outlay data for the 145 cities, using for 1900-1930 the sum of the population estimates for the individual cities as published in the *Financial Statistics of Cities* for each year. For 1931-1937, the population totals were estimated by interpolation on the basis of the Census of Population for 1930 and 1940.

#### CONSTRUCTION COST AND BUILDING PERMIT INDEXES (H 64-79)

**H 64-73. Construction cost indexes, 1910-1945.** SOURCE: *Engineering News-Record*, annual construction costs number, April of each year, McGraw-Hill Publishing Co., N. Y., except H 71-72, for source of which see text of individual series. Text for individual series show primary sources whenever possible. Data shown here for series H 66 (Boeckh) and H 68-69 (Handy) are heretofore unpublished but are based on the data which appear in the *Engineering News-Record*. For additional explanation of these series and for construction cost indexes with the base 1939=100, see Bureau of Foreign and Domestic Commerce, *Industry Report on Construction and Construction Materials, Statistical Supplement*, May 1948.

Construction cost indexes are useful in the conversion of construction expenditure data from current prices to constant prices and in the study of cost trends. However, no single cost index is satisfactory for all types of construction, since, as the present series indicate, the movements of cost differ for different types of construction. A rough approach to a cost index for total new construction may be obtained by dividing series H 2, total new construction in current prices, by series H 26, total new construction in 1939 prices.

Construction cost indexes generally are not fully adequate for the making of cost comparisons over an extended period of time. Changes in the productivity of and the proportions used of the various productive factors cannot be allowed for easily in the assignment of weights to labor, materials, and other cost items. An aggregative index proportional to the total construction cost of a standardized project or a component part thereof, is not easily computed for most types of construction and suffers from the disadvantage of the probable eventual obsolescence of any adequately specified standard project. For further discussion of this subject see: Chawner, Lowell J., "Construction Cost Indexes as Influenced by Technological Changes and Other Factors," *Journal of the American Statistical Association*, 1935, vol. 30, pp. 561-576.

**H 64. Engineering News Record, construction cost index, 1913-1945.** Base: 1913=100. SOURCE: See text for series H 64-73, above. The index is based on the aggregate cost of the following items: 2,500 pounds of structural steel at base price; 6 barrels of cement at Chicago price; 1,088 board feet of lumber, 2"x4", surfaced-on-4-sides pine and fir in carload lots, using a weighted average of prices in 20 cities; and 200 man hours of common labor, using a weighted average of wages in 20 cities. Prior to 1935, the lumber component was based on the New York wholesale price of 12"x12" long leaf yellow pine.

**H 65. Turner, building cost index for Eastern cities, 1913-1945.** Base: 1913=100. SOURCE: See text for series H 64-73, above. The index is based on the Turner Construction Co.'s building cost experience in Eastern cities as applied to materials prices, wage rates, productivity of labor, efficiency of plant and management, and competitive conditions.

**H 66. Boeckh, residential construction cost index, 1910-1945.** Base: 1926-1929=100. SOURCE: E. H. Boeckh and Associates.

Inc., Consulting Valuation Engineers, Cincinnati, Ohio (Statistical and Publications Office, Washington, D. C.). Figures on a monthly basis are shown in their monthly publication, *Building Costs*. Monthly indexes are prepared for individual cities, by types of construction. Surveys are made of local construction cost conditions in each city to determine the materials prices actually paid by contractors to dealers, and the prevailing wage rates for skilled and for common labor. Some allowance is made for variations in labor efficiency and labor shortages in some areas. Sales taxes, social security taxes, and compensation insurance are included. See also Housing and Home Finance Agency, *Housing Statistics Handbook*, 1948, pp. 33-34.

The present annual index is derived from an unweighted average of the cost for frame and for brick residential construction in the 20 cities for which the Boeckh data are available. The base of the index is the United States average for 1926-1929, an average derived from more than the 20 cities covered by the index.

**H 67. Railroad construction cost index, 1910-1945.** Base: 1910-1914=100. SOURCE: Interstate Commerce Commission, Bureau of Valuation, Engineering Section, "Accounts 1-45, for Road," published annually in *Railroad Construction Indexes*. This index refers to the total road construction cost of Class I railroads. It is based on returns by carriers, joint studies made with various subcommittees of President's Conference Committees, data from engineering and trade publications, contracts covering major construction projects and other information furnished by carriers.

**H 68-69. Handy, public utility construction, cost indexes, 1911-1945.** Base: 1911=100. SOURCE: See note for series H 64-73, above. Individual indexes for each of 81 cost elements affecting the cost of public utility construction are compiled for each of five geographic regions as of January 1 and July 1 each year. The compilers are Whitman, Requardt and Associates and B. L. Smith Associates, Baltimore, Md., for the Estate of William W. Handy. Selected cost elements are combined to give cost indexes for various major categories of utility construction, using weights based on cost analysis experience, materials price data from *Engineering News-Record* and *Iron Age* and from manufacturers, and wage rates reported by utility companies, trade unions, and building associations. Indexes are published by major categories for each of the five geographic regions.

The present cost indexes for the total construction and equipment of gas plants (H 68) and for electric light and power plants (H 69) are computed from unweighted averages of the five regional indexes, with weights of 1, 2, and 1, respectively, assigned to the initial, middle, and closing averages for each year. For 1916 and 1923, only initial and closing averages were available and for 1921 a September 1 average replaced the mid-year average. There were no data for 1922, so indexes for that year were obtained by interpolation on the basis of movements in the Handy utility building index. Beginning in 1934, when monthly reporting of data commenced, the data for each month were released during the same month, so such data were lagged 1 month, that is, taken as applying to the previous month.

**H 70. Highway construction cost index, 1922-1945.** Base: 1925-1929=100. SOURCE: Public Roads Administration, quarterly publication, *Price Trends in Highway Construction*. This is an index of the cost of construction of a composite standard mile of highway. The index is based on aggregate bid prices for the following: 17,491 cubic yards of excavation; 3,726 square yards of surfacing; and structures requiring 16,000 pounds of reinforced steel, 4,325 pounds of structural steel, and 68 cubic yards of structural concrete. The excavation includes common excavation plus other excavation items expressed as equivalent common excavation. The surfacing includes portland cement, concrete, and other surfacing items expressed as equivalent portland cement concrete.

**H 71-72. Farm construction cost indexes, 1910-1945.** Base: 1910-1914=100. SOURCE: Department of Agriculture, Bureau of Agricultural Economics, *Income Parity for Agriculture: Part II—*

*Expenses of Agricultural Production*; see Section 5, "Expenditures for and Depreciation of Permanent Improvements on Farms, 1910-1940," March 1941, table 7, p. 28. Data for 1941-1945 were obtained from records of the Department of Agriculture. The farm construction cost index for operators' dwellings (H 71) covers only farm operators' dwellings located on the farm operated. The index for service buildings (H 72) covers barns and other buildings used in production, dwellings other than operators' dwellings, fences, windmills, and wells. Excluded are roads, terraces, windbreaks, orchards, dams, ponds, irrigation and drainage works, and the like. Because of lack of data, also excluded are value of materials and labor furnished by the farm. Indexes of the prices of construction materials purchased and the wage rates of labor hired for construction were used. In the case of operators' dwellings (H 71), the total weight assigned to materials was 73 percent and to labor 27 percent. In the case of service buildings (H 72), the weights were 78 percent for materials and 22 percent for labor. These weights were based on a survey made in 1936 and were assumed to be applicable throughout the period covered. While the wages paid by farmers for construction labor are higher than the wages paid for ordinary agricultural labor, it was assumed that wages for farm construction labor have fluctuated more like the farm labor wage rates than like the urban union wage rates in the building trades.

**H 73. American Appraisal Co., building cost index, 1913-1945.** Base: 1913=100. SOURCE: See text for series H 64-73, above. The index covers 30 cities for 1925-1945 and 24 cities for 1913-1924, and is based on the structural cost items used in four types of buildings: All frame, brick with wood frame, brick with steel frame, and reinforced concrete. Mechanicals, such as plumbing, heating, lighting, and elevators, are excluded. The index is calculated from actual appraisal costs for each city, using normal average materials prices, average wages and the market conditions of the individual cities. Such extremes in costs as the following are excluded: Premium prices, overtime wages for rush work, and cut-throat price practices during depression periods. Allowance is made for such overhead costs as Social Security taxes and unemployment insurance.

**H 74-79. Building permit indexes, 1856-1939.** SOURCE: See detailed listings for individual series below. While comprehensive estimates of construction expenditures by types of construction, such as presented in series H 1-25, will generally be preferred for most purposes, building permit data are available for a considerably longer period. Permit values are based on the sum of estimates by builders of the costs of building for which permits are granted or plans filed. Permit data generally cover private, rather than public, construction; building, rather than nonbuilding, types of construction; and are generally limited to construction within the corporate limits of the cities covered. On the average, the cost of the projects covered is underestimated; small projects are generally not covered at all. Permit data are less frequently available for smaller cities and for earlier years. It follows that building permit data in unadjusted form are unsatisfactory as measures of the total absolute volume of new construction. Permit data are often more satisfactory when used in the form of relatives or indexes of permit values, as in the case of series H 77-79.

Indexes of the number of permits granted (series H 74-76) do not require adjustment for price changes and undervaluation of projects. However, the number indexes suffer from the remaining limitations associated with permit value indexes.

Although the absolute amount of construction activity is not adequately indicated by early permit data, the data clearly indicate the presence and approximate timing of cycles in private building. However, the relatively few cities upon which permit indexes are based during the earlier years suggests caution in the drawing of quantitative conclusions, particularly as to the amplitude of building cycles. Nonbuilding construction of various types and public building have fluctuated somewhat differently from building permit indexes, so that the data available for the

analysis of cycles in total new construction over an extended period of years are particularly inadequate.

**H 74-76. Indexes of number of building permits, 1856-1936.** Base: 1920-30=100 (see next paragraph). SOURCE: Long, Clarence D., Jr., *Building Cycles and the Theory of Investment*, Princeton University Press, 1940, pp. 228-229. For 1856-1862, only Philadelphia is covered. Manhattan and part of the Bronx were added in 1863, Boston in 1873, Brooklyn in 1874, Washington (D. C.) and Wards 23 and 24 of the Bronx in 1875, Newark in 1878, Salem in 1879, Detroit in 1880, New Haven in 1881, Providence in 1883, Minneapolis and Cambridge in 1887, Indianapolis in 1891, the remainder of the Bronx in 1895, Bridgeport, Atlanta, Louisville, and Waltham in 1896, Watertown (Mass.) and Queens and Richmond Boroughs in 1898, New Bedford in 1899, Baltimore in 1901, Rochester in 1906, Portland (Me.) in 1907, Cleveland and Richmond (Va.) in 1908, St. Louis in 1910, Springfield (Mass.) in 1911, and Kansas City (Mo.) in 1912. For 1887-1912 Philadelphia data were excluded from total nonresidential and total new building data because of the reporting of an excessive number of miscellaneous structures.

Since the number of cities covered varied from 1 to 30 (or 26 if all the Boroughs—Brooklyn, Bronx, Manhattan, Queens, and Richmond—of New York City are combined), the aggregate number of permits each year was divided by the aggregate number for the same cities during 1920-1930. Thus, the base used was a shifting one. For additional explanation, see text for series H 74-79, above.

**H 77. Index of building permit values, 1868-1939.** Base: 1930=100 (see next paragraph). SOURCE: Long, Clarence D., Jr., *Building Cycles and the Theory of Investment*, Princeton University Press, 1940, pp. 213-223. This index was obtained by averaging the monthly indexes given in the source. For 1868-1874, only Manhattan is covered. Louisville was added in 1875, Detroit in 1881, Brooklyn and St. Louis in 1882, Cincinnati and Minneapolis in 1887, Cleveland and Nashville in 1888, Boston in 1889, New Haven in 1890, Chicago and St. Joseph in 1891, Indianapolis and Syracuse in 1892, Trenton in 1893, Omaha, Pittsburgh, Philadelphia, St. Paul, Denver, Kansas City (Mo.), Los Angeles, New Orleans, and Washington (D. C.), in 1894; Duluth in 1895, Cambridge, Fort Wayne, Atlanta, and Milwaukee in 1896; the Bronx, Alleghany (Pa.), and Buffalo in 1898; Newark (N. J.) and Everett (Mass.) in 1906; and Richmond and Queens Boroughs (New York City) in 1916. Cambridge was omitted for 1911-1917, and Trenton was omitted for 1912 and 1924-1929. Alterations were excluded from Brooklyn data for 1882-1892 and 1895-1896. Alterations were estimated for Boston for 1893-1894, 1903, and 1906-1908. Manhattan data were estimated for 1880.

Since the number of cities covered varied from 1 to 37 (or 33 if all the Boroughs—Brooklyn, Bronx, Manhattan, Queens, and Richmond—of New York City are combined), the aggregate permit volume each year was divided by the aggregate volume for the same cities in 1930. Thus, the base used was a shifting one. For additional explanation, see text for series H 74-79, above.

**H 78-79. Building permit index, 1875-1933.** SOURCE: Newman, William H., "The Building Industry and Business Cycles," *The Journal of Business of the University of Chicago*, vol. VIII, No. 3, pp. 63-71. These are annual indexes and annual averages of monthly indexes. Series H 78, in current prices, with 1920-30=100, is based on: Bradstreet's building-permit values, 120 identical cities, 1911-1933; Babson's monthly values of building permits in 20 cities, 1903-1910; Ayres' permits in 50 cities, 1900-1902; and permit data from 13 cities, 1875-1900. Series H 79, in 1913 prices with 1913=100, is obtained from series H 78 by the use of the following building cost indexes. The American Appraisal Co.'s building construction cost index, 1913-1933; an arithmetic average of the American Appraisal Co.'s cost indexes for frame, brick and reinforced concrete buildings, 1900-1913; and an average of the

frame- and the brick-building cost indexes, 1875-1900. For additional explanation, see text for series H 74-79, above.

#### CONSTRUCTION EMPLOYMENT (H 80)

**H 80. Construction Employment, 1929-1945.** SOURCE: 1929-1943, Bureau of Labor Statistics, *The Construction Industry in the United States*, Bulletin No. 786; 1944-1945, *Monthly Labor Review and Construction*, both published monthly by Bureau of Labor Statistics.

The estimates include wage earners, salaried employees, and special trades contractors actively engaged on all types of new construction work and on alterations, additions and repair work of the kind usually covered by building permits. Force-account workers (employees of nonconstruction firms and public bodies who perform construction work) are also included as well as self-employed persons, working proprietors, and workers employed by construction firms either on or off the construction site. The estimates exclude persons engaged in maintenance work.

For federal construction, employment is estimated directly from reports on employment collected from contractors. For nonfederally financed construction, the employment averages are derived primarily by converting construction expenditure figures into the average number of man-months of labor ordinarily required to perform the volume of work reported.

#### Housing: Series H 81-135

##### EXISTENT HOUSING UNITS (H 81-112)

**H 81-83. Available housing units and total families in nonfarm areas, 1900-1938.** SOURCE: Chawner, Lowell J., *Residential Building*, National Resources Committee, 1939, Housing Monograph Series No. 1, table VI, p. 16. Annual estimates of total available housing units were obtained by calculating the net annual increases in the supply. Changes in the available supply of housing depend not only upon new building but also upon such factors as the conversion of large single-family houses to multiple-family dwellings, the conversion of residential structures to other forms of use, principally to stores and offices, and the withdrawal of structures from use by demolition and by destruction through catastrophes, such as fire, flood, and tornado.

The term "family" as used here refers to "natural groups such as man and wife (with or without children and other dependents), and widower, widow or divorcee (with or without dependents). The year-to-year fluctuations in single-person 'families,' i. e., single individuals occupying a dwelling unit, are disclosed only to a very limited extent in [these series]." (See footnote 1, table I, p. 2, of source cited above.) Series H 83 is affected by the doubling-up of families into single dwelling units, a fact that accounts for the ratio of families to available units being greater than unity in the years 1922-1924 and 1938.

For data on nonfarm dwelling units started, on construction cost of new units, and on expenditures for new nonfarm residential construction, see series H 40-47.

**H 84-88. Nonfarm dwelling units standing and net additions to supply, decennially 1900-1939.** SOURCE: The Twentieth Century Fund, *American Housing*, 1944, appendix table 35, p. 410.

These figures were derived by projecting backwards the number of nonfarm dwelling units reported by the 1940 Census of Housing. Thus, 29,706,000 units, including both occupied and vacant units, were standing in 1940 (preliminary estimate). According to "Housing and the Increase in Population," *Monthly Labor Review*, April 1942, a total of 3,459,000 new and converted units were built from 1930 to 1940, 952,000 makeshift units were added and 397,000 units were demolished. The total standing in 1930 was thus 25,692,000. For earlier decades, the same procedure was followed, using data for new and converted units and demolitions as reported in Wickens, David L., *Residential Real Estate*, National Bureau of

Economic Research, 1941, table EM5, p. 54. The average shown is the arithmetic mean of the four decades.

**H 89-112. Occupied dwelling units or families, and tenure of homes, decennially, 1890-1945.** SOURCE: For 1890-1940, see Sixteenth Census Reports, *Housing*, vol. II, pt. 1; for 1945, see *Characteristics of Occupied Dwelling Units for the United States: November 1945*, Special Census Reports on Housing, Series H 46, No. 1. The 1910 figure for farm population (series H 106) is an estimate which appears in Truesdell, Leon E., *Farm Population of the United States, 1920*, Bureau of the Census, Census Monographs VI, Washington, D. C., 1926, p. 45. The 1910 figure for nonfarm population (series H 98) was derived by subtracting the estimated farm population from the total population.

The first Nation-wide Census of Housing was taken in 1940. For that census, an occupied dwelling unit was defined as the living quarters occupied by one household. (A dwelling unit might be a detached house; a tenement, flat, or apartment in a larger building; or a room in a structure primarily devoted to business or other nonresidential purposes; a tourist cabin; a trailer, boat, tent, etc., if occupied by persons having no other place of residence.)

The term "private family," in 1940, was synonymous with the term "private household." A *private household*, in the 1940 census, included the related family members and the unrelated lodgers and servants or hired hands who lived in the same dwelling unit and shared common housekeeping arrangements. However, the number of occupied dwelling units in 1940, shown here, is not identical with the number of private families in 1940 (see series B 171). The difference is caused by the fact that the living quarters of about 115,000 families, that were enumerated in 1940 at other than their usual place of residence, were classified as vacant, rather than as occupied, but the related members of the household were counted as a private family. Also the small number (about 20,000) of lodging places with 11 or more lodgers were counted as occupied units, but the heads of such lodging houses were not counted as heads of private families.

The comparability of the present series rests on the fairly close correspondence of the definition of occupied dwelling unit used in 1940 and that for family or home used in previous censuses. The count of families for 1930 and 1900 (shown here) represents private families only; that for 1920, 1910, and 1890 includes the small number of quasi-family groups which were counted as families in those years. See text for series B 171-181.

For purposes of comparison with the 1940 population per occupied dwelling unit, the total population per private family in 1930 and 1900 is used and not the "population per private family" as published in the 1930 census reports. (The latter is obtained by dividing the population in private families, excluding persons in

institutions and other quasi-family groups, by the number of private families.) Since the population in private families was not tabulated separately except in 1930 and 1900, the total population per private family is used because of its closer comparability with statistics for the other years.

A dwelling unit is classified as owner-occupied if it was owned wholly or in part by the head of the household or by some related member of his family living in the dwelling unit. All other occupied units are tenant-occupied whether or not cash rent was actually paid.

#### NONFARM HOUSING CREDIT (H 113-135)

**H 113-119. Mortgage loans made on one-to-four-family nonfarm homes, 1925-1945.** SOURCE: Federal Home Loan Bank Administration, *Statistical Supplement to the Federal Home Loan Bank Review*, 1947, table 14, p. 14. These data are based on mortgages recorded throughout the country by type of mortgage, and special studies and reported statistics of various types of mortgage lending institutions. The data do not include mortgage loans made on farm or commercial properties. The "home loans" include all mortgage loans on one-to-four-family nonfarm residences regardless of occupancy status (owner-occupied, rented or vacant). See also, Housing and Home Finance Agency, *Housing Statistics Handbook*, 1948, particularly part 3 on "Housing Finance."

**H 120-126. Mortgage loans outstanding on one-to-four family nonfarm homes, 1925-1945.** SOURCE: Same as series H 113-119.

**H 127. Number of foreclosures made on nonfarm homes, 1925-1945.** SOURCE: Federal Home Loan Bank Administration, *Statistical Supplement to the Federal Home Loan Bank Review*, 1947, table 16, p. 14. These figures are based on data reported monthly from approximately 1,500 counties, cities, townships, or other governmental divisions, and measuring the number of properties acquired monthly through foreclosures. Approximately 65 percent of all nonfarm dwellings are included in the sample used.

**H 128-132. Operating savings and loan associations, 1920-1945.** SOURCE: Federal Home Loan Bank Administration, *Statistical Supplement to the Federal Home Loan Bank Review*, 1947, table 7, p. 7. For data for 1920-1921 for series H 128-129, see U. S. Savings and Loan League, *Secretary's Annual Report*, Chicago, 1946. These data are based on a compilation from the annual reports of FHLB member associations and of State savings and loan supervisory authorities. These data show selected statistics for all operating savings and loan associations. The data do not include resources of institutions in liquidation.

**H 133-135. Building and Loan Association failures, 1920-1945.** SOURCE: U. S. Savings and Loan League, *Secretary's Annual Report*, Chicago, 1946.

Series H 48.—NUMBER OF NONFARM DWELLING UNITS DEMOLISHED PER DECADE: 1890 TO 1939

[In thousands of units]

DECADE	Number
1930-1939	397
1920-1929	580
1910-1919	414
1900-1909	297
1890-1899	208

<sup>1</sup> Includes both public and private units.

<sup>2</sup> Estimates for 1945 shown in series H 40-46 have been adjusted to allow for lapsed building permits and lag between issuance of permits and actual start of construction. These factors were not particularly significant prior to 1945.

<sup>3</sup> Bureau of Labor Statistics estimated totals for these years are (in thousands):

1919, 330; 1918, 120; 1917, 230; 1916, 480; 1915, 475; 1914, 445; 1913, 455; 1912, 490; 1911, 480; 1910, 475. Urban-rural distribution not available separately for these years.

<sup>4</sup> Not available.

<sup>5</sup> Includes public residential construction amounting to 28 million dollars.

## Series H 49-50.—CONSTRUCTION MATERIALS—VALUE OF OUTPUT, DESTINED FOR DOMESTIC CONSUMPTION: 1869 TO 1939

1900 <sup>7</sup>	82.7	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )	4.27

<sup>1</sup> Figures for 1933-1937 include construction expenditures of Metropolitan Water District of Southern California directly assessable against the city of Los Angeles, which were added to the waterworks outlay totals of the Bureau of the Census.<sup>2</sup> See text for categories included. Figures for 1924-1931 include capital outlays of New York City for the Independent Subway System, which were added to the totals reported by the Bureau of the Census. Bureau of the Census included these expenditures in its outlay figures for later years.<sup>3</sup> Estimated on basis of 83 cities.<sup>4</sup> Not available.<sup>5</sup> Estimated on basis of 107 cities.<sup>6</sup> Partially estimated.<sup>7</sup> Estimated on basis of 124 cities.

Series H 64-73.—CONSTRUCTION—COST INDEXES: 1910 TO 1945

1890	4,767,179			4,767,179	3,142,746	65.9	1,624,433	34.1	

<sup>1</sup> Figure for 1945 is estimate as of November 1; figures for 1890 to 1940 are for decennial census dates.

<sup>2</sup> These figures are not exactly comparable with 1940 since in 1940, 88,265 urban-farm units were included in the farm rather than in the nonfarm figures. Furthermore, data for 1945 are based on a sample survey conducted by the Census Bureau in November 1945 in connection with Monthly Report on the Labor Force.

<sup>3</sup> Revised. <sup>4</sup> Not available <sup>5</sup> Estimated; see text.

## Series H 113-127.—NONFARM HOUSING CREDIT—ESTIMATED VOLUME OF HOME MORTGAGE LOANS MADE AND OUTSTANDING, AND OF FORECLOSURES: 1925 TO 1945

## Chapter J. Manufactures (Series J 1-180)

### General Statistics: Series J 1-12

**J 1-12. General statistics for all manufacturing industries, 1849-1939.** SOURCE: Bureau of the Census, Sixteenth Census of the United States (1940), *Manufactures, 1939*, vol. I, tables 2 and 4, pp. 19-20; *Statistical Abstract of the United States*, 1946, table 923, p. 809. For "factories and hand and neighborhood industries," data for 1849-1899 are for all establishments with products valued at \$500 or more. For "factories excluding hand and neighborhood industries," data for 1914-1939 are for establishments reporting products to the value of \$5,000 or more. Limited data collected in 1921, 1923, and 1925, from establishments with products valued at less than \$5,000, show that (except for the number of establishments) the change in the minimum value-of-products limit did not materially impair the comparability of the data over time.

The basic source of comprehensive data on manufacturing production has been the Census of Manufactures conducted by the Bureau of the Census. This census was taken decennially from 1849 to 1899, for each fifth year thereafter through 1919, and biennially from 1921 through 1939. During the recent war years the Census of Manufactures was abandoned as directed by Executive Order No. 9152 in the interests of more important work related to the Nation's war effort.

Conceptually an establishment (series J 1) is a geographically isolated manufacturing unit maintaining independent bookkeeping records, regardless of its managerial or financial affiliations. An establishment—which may be a single plant or a group of closely located plants operated by a single plant or a group of closely located plants operated by a single company without separate records for each—is the basic reporting unit. In addition, the establishment is the basic unit of industrial classification, being assigned to an industry on the basis of its reported product of chief value.

The 1939 Census of Manufactures questionnaire for the first time called for personnel employed in distribution, construction, etc., separately from the manufacturing employees of the plants. Therefore, the data for earlier years shown for series J 3 and J 4 probably are not strictly comparable with those for 1939. It is not known how many of the wage earners and the salaried employees reported at previous censuses were engaged in distribution and construction, and how many were engaged in manufacturing. Wage earners include working foremen and "gang and straw bosses"; foremen whose duties are primarily supervisory are classified as salaried employees.

Figures for the cost of materials, fuel, etc. (series J 8), represent actual consumption during the year, not purchases made within the year. The cost of materials does not include replacements or construction material charged to capital accounts. It represents not only new and semi-manufactured materials, but also certain commodities (e. g., textiles, flour, and wire) which in some cases are sold to individual consumers as finished products, when they are used as materials for further processing.

Value of products (series J 9) are selling values at the factory or plant of all commodities produced, whether sold, transferred to other plants, or in stock. Because of duplication, that is, the use of the products of some establishments as materials in others, value of product is not always a satisfactory measure of the importance of a given industry. The net value of all manufactured products, exclusive of such duplication, is estimated to have been approximately two-thirds of the gross value for 1929. Value added by manufacture (series J 10), obtained by subtracting the cost of

materials from the value of products, is almost free of such duplication.

There have been changes in scope from one Census of Manufactures to another. Data from the last previous census are usually retabulated to make them as comparable as possible with the more recent census. Unless the change is to omit an entire industry for which separate tabulations are available during each census, these changes in scope usually are not carried back through more than the one previous census. For two major changes, the exclusion of hand and neighborhood industries after 1899 and the exclusion of plants with an annual products of \$500 to \$5,000 after 1914, it has been necessary to show, insofar as possible, data on two bases for the terminal year.

### Indexes of Production: Series J 13-48

**J 13. Index of manufacturing production 1899-1939.** Base: 1899 = 100. SOURCE: For 1899-1937, see Fabricant, Solomon, *The Output of Manufacturing Industries, 1899-1937*, National Bureau of Economic Research, New York, 1940, table 1, p. 44; for 1938-1939, see same author, *Employment in Manufacturing, 1899-1939*, National Bureau of Economic Research, New York, 1942, p. 331. The index for census years has been constructed from basic data in the U. S. Census of Manufactures and other sources. (Details of method are described in chapter 2 and appendix A of the source volume cited first above.) Interpolations for intercensal years are based on annual indexes, less comprehensive in coverage, computed by Mills, F. C., *Economic Tendencies in the United States*, National Bureau of Economic Research, New York, 1932, p. 563; Persons, W. M., *Forecasting Business Cycles*, John Wiley and Sons, New York, 1931, p. 171; Stewart, W. W., "An Index Number of Production," *American Economic Review*, March 1921; and the Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, August 1940.

**J 14. Index of manufacturing production, 1863-1930.** Base: 1909-1913 = 100. SOURCE: Persons, Warren M., *Forecasting Business Cycles*, John Wiley and Sons, New York, 1931, table 12, pp. 170-171. This index is a weighted average of a number of leading manufactured commodities as follows: 6 in 1863-1867; 12 in 1867-1874; 21 in 1875-1899; and 30 in 1899-1930. For further details, see pp. 173-177 of the source.

**J 15-29. Physical output, indexes for major groups of manufacturing industries, 1899-1939.** Base: 1929 = 100. SOURCE: For 1899-1937 data, see Fabricant, Solomon, *The Output of Manufacturing Industries, 1899-1937*, National Bureau of Economic Research, New York, 1940, table 5, pp. 60-61; for 1939 data, see same author, *Employment in Manufacturing, 1899-1939*, National Bureau of Economic Research, New York, 1942, appendix F. These indexes cover only those years beginning with 1899 in which the Census of Manufactures was taken, namely quinquennially to 1919 and biennially thereafter. Because of inadequacy of data for most groups, no attempt was made to interpolate between intercensal years. (For details of method of construction see chapter 2 and appendix A of source volume cited first above.)

**J 30-48. Manufacturing production, indexes by groups, 1919-1945.** Base: 1935-1939 average = 100. SOURCE: For 1919-1942, see Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, October 1943, pp. 964-984; for 1943, see same, April 1944, pp. 384-385; for 1944-1945, see same, April 1946, pp. 422-423. About 100 individual series are used in constructing these indexes, which are computed monthly both with and without seasonal ad-

justment. Some of the individual series are based on production data, others relate to consumption or shipments, machinery-hours active or man-hours worked. In a number of instances man-hours worked are adjusted to allow for broad changes in output per man-hour. Many of the other series are adjusted to more accurate physical volume figures not available monthly. For weights and data used and description of method, see *Federal Reserve Bulletin*, October 1943, pp. 953-957.

### Value of Output: Series J 49-148

**J 49-96. Value of output of finished products and construction materials at producers' current prices, 1919-1933.** SOURCE: Kuznets, Simon, *Commodity Flow and Capital Formation*, National Bureau of Economic Research, New York, 1938, vol. I, tables II-3 and VI-1, pp. 136-138 and 348. These estimates are derived from Census of Manufactures data, supplemented by less complete data for nonmanufactured finished commodities and construction materials, and for intercensal year interpolations. The estimates of finished commodities measure the value of commodities that have reached the form in which they are used by ultimate recipients—largely households in the case of consumers' goods, chiefly business and public enterprises in the case of producers' goods. Unfinished commodities and finished commodities that are used as materials in manufacturing other products, such as flour used by manufacturing bakeries, are omitted in order to avoid duplication in measuring the national economy's end-product. The estimates presented here exclude transportation and distribution costs, and hence are not in terms of prices to final users. Nor do they measure domestic consumption, for they make no allowance for either imports or inventory changes.

**J 97-148. Value of output of finished commodities and construction materials at producers' current prices, 1869-1919.** SOURCE: Shaw, William H., *Value of Commodity Output since 1869*, National Bureau of Economic Research, New York, 1947, table I-1, pp. 30-65. The procedures used in making these estimates are similar to those used for series J 49-96, although based, necessarily, on less adequate information.

### Capital Expenditures: Series J 149-151

**J 149-151. New manufacturing capital expenditures for plant and equipment, 1915-1940.** SOURCE: Chawner, Lowell J., "Capital Expenditures for Manufacturing Plant and Equipment—1915 to 1940," Department of Commerce, *Survey of Current Business*, March 1941, p. 10. The plant expenditures (series J 150) refer to buildings (including heating, plumbing, and similar accessory equipment), and other fixed structures such as vats, blast furnaces, and docks. The estimates of factory building construction are based primarily on F. W. Dodge Corporation contract awards adjusted upward on the basis of information from other sources to take care of underenumeration and regions not covered by the Dodge reports. Estimates of plant construction other than buildings were derived by allocating to manufacturing capital a portion of the value of the products included as reported by the Bureau of the Census. The absolute magnitude of this series depends in an important degree upon allowances for mark-up and for installation and transportation costs, and allowances for under-reporting.

The equipment expenditures (series J 151) refer to movable equipment, and are based on Census of Manufactures data. Prior to 1923 allowance was made for under-reporting. Those items not used entirely in manufacturing were allocated on the basis of data from trade associations and specialists in the various machinery industries. For 1923 and subsequent years, intercensal year interpolations were made on the basis of a Bureau of Labor Statistics index of pay rolls of industrial-machinery manufacturers. For the intercensal years between 1914 and 1919, estimates were made by using annual reports from 5 States. The series was then adjusted for imports and exports, inventory changes, for the differences

between factory costs and cost to the industrial purchaser, and Census underenumeration.

### Physical Output of Specific Commodities: Series J 152-180

**J 152-164. Physical output (census years) of selected manufactured commodities, 1899-1939.** SOURCE: For 1899-1937, see Fabricant, Solomon, *The Output of Manufacturing Industries, 1899-1937*, National Bureau of Economic Research, New York, 1940, pp. 395, 480, 481, 489, 490, 506, 517, 518, 522, and 574; for 1939 figures, see Bureau of the Census, Sixteenth Census of the United States (1940), *Manufactures, 1939*, vol. II, parts 1 and 2. The source of these data is the Census of Manufactures, supplemented where necessary by statistics from other sources. The data on rayon yarns (series J 153) comes from the Censuses of 1927 and 1931 to 1939, and the Textile Economics Bureau, Inc., *Rayon Organon*, for other years; they relate to production of rayon filament yarn and rayon staple fiber exclusively, and take no account of waste and other minor primary rayon items. In respect to the series on refrigerators (J 164), data on gas refrigerators were obtained from the Statistical Department of the American Gas Association, and on electric refrigerators from *Air Conditioning and Refrigeration News and Electrical Merchandising*. The figures relate to sales, not production. Data on refrigerators for more recent years are available in the above publications.

**J 165-180. Physical output (annual data) of selected manufactured commodities, 1840-1945.** SOURCE: Bureau of the Census, *Statistical Abstract of the United States*, 1947 and earlier issues. See also detailed listings below.

**J 165-169. Steel ingots and castings production, 1867-1945.** SOURCE: The series are those of the American Iron and Steel Institute as presented in the *Statistical Abstract*, 1908 to 1947 (various issues). Beginning in 1934, the figures include only that part of steel for castings which was made in foundries producing steel ingots.

**J 170. Rolled iron and steel production, 1885-1945.** SOURCE: For 1885-1929, see Burns, Arthur F., *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, p. 300; for 1930-1945, see *Statistical Abstract*, 1947, table 969, p. 867. The basic sources of this series are the annual reports of the American Iron and Steel Institute. The figures include rails, plates and sheets, merchant bar and skelp production, wire rods, and structural shapes.

**J 171. Leaf tobacco consumed in manufacturing, 1880-1945.** SOURCE: For 1880-1929, see Burns, Arthur F., *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, p. 300; for 1930-1945, see *Statistical Abstract*, 1947, table 930, p. 844. Primary source of data is the *Annual Report of the Commissioner of Internal Revenue*. The figures represent the equivalent in unstemmed leaf tobacco of stemmed leaf or scraps, cuttings, and clippings. The tobacco used in the manufacture of cigars and cigarettes was converted on the basis of 3 pounds of stemmed leaf or scraps, etc., to 4 pounds of unstemmed beginning 1915 (conversion prior to 1915 was at ratio of 3 to 5) and of tobacco and snuff beginning 1903. Data exclude tobacco used in bonded manufacturing warehouses.

**J 172. Fermented malt liquor production, 1870-1945.** SOURCE: For 1870-1929, see Burns, Arthur F., *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, p. 292; for 1933-1938, see *Statistical Abstract*, 1942, table 920, p. 944; for 1939-1945, see *Statistical Abstract*, 1946, table 954, p. 859. The primary source of this series is the *Annual Report of the Commissioner of Internal Revenue*.

**J 173. Distilled spirits production, 1870-1941.** SOURCE: For 1870-1929, see Burns, Arthur F., *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, p. 292; for 1930-1933, see *Statistical Abstract*, 1936, table 804,

p. 787; for 1934-1941, see *Statistical Abstract*, 1942, table 920, p. 944. The primary source of this series is the *Annual Report of the Commissioner of Internal Revenue*. The figures include industrial alcohol. Figures for 1942-1945 are not shown because they exclude ethyl alcohol and are therefore not comparable with those in this series.

**J 174. Cigarette production, 1880-1945.** SOURCE: For 1880-1929, see Burns, Arthur F., *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, p. 298; for 1930-1934, see *Statistical Abstract*, 1936, table 801, p. 786; for 1935-1945, see *Statistical Abstract*, 1947, table 931, p. 845. The primary source of this series is the *Annual Report of the Commissioner of Internal Revenue*.

**J 175. Cottonseed oil production, 1919-1945.** SOURCE: Bureau of the Census, *Bulletin 183, Cotton Production and Distribution*, 1946, table 30, p. 57. These figures relate to the year ending July 31

**J 176. Wool consumed in manufactures, scoured basis, 1922-1945.** SOURCE: *Statistical Abstract*, 1946, table 739, p. 655. The primary source of these data is the Bureau of the Census.

**J 177-178. Men's and women's leather shoe production, 1899-1945.** SOURCE: *Statistical Abstract* (various issues) 1929-1946; Fabricant, Solomon, *The Output of Manufacturing Industries, 1899-1937*, National Bureau of Economic Research, New York, 1940, p. 474. The data have been compiled by the Bureau of the Census since 1925 from monthly reports of manufactures. Figures show thousands of pairs of leather uppers for men's and women's shoes. They do not include youth's and boy's, misses', children's, infants', athletic, part leather, or nonleather shoes.

**J 179. Cotton consumed in manufacturing (including linters), 1840-1945.** SOURCE: Bureau of the Census, *Bulletin 183, Cotton Production and Distribution*, 1946, table 16, p. 31, and table 13, p. 26. Data include linters for the period 1909-1945; data prior to 1909 are exclusive of linters.

**J 180. Active cotton system spindles consuming cotton, 1840-1945.** SOURCE: Bureau of the Census, *Bulletin 183, Cotton Production and Distribution*, 1946, table 16, p. 31.

Series J 1-12.—MANUFACTURES—GENERAL STATISTICS FOR ALL MANUFACTURING INDUSTRIES: 1849 TO 1939

[Data for 1849-1914 include all establishments having products valued at \$500 or more; for 1914-1939, those having products valued at \$5,000 or more. While the data have been adjusted for the principal changes in the scope of the Census of Manufactures, such as the omission of entire industries, it has not been possible to carry through all adjustments for minor change.]

YEAR	Number of establishments	PERSONS ENGAGED			SALARIES AND WAGES (THOUSANDS OF DOLLARS)			COST AND VALUE (THOUSANDS OF DOLLARS)			HORSEPOWER <sup>4</sup> (THOUSANDS)	
		Proprietors and firm members	Salaried officers and employers	Wage earners (average for year)	Total	Salaries	Wages	Cost of materials, fuel, etc. <sup>1 2</sup>	Value of products <sup>2</sup>	Value added by manufacture <sup>3</sup>	Prime movers	Motors run by purchased energy

<sup>1</sup> Comprises cost of materials, supplies, fuel, and purchased electric energy.  
<sup>2</sup> For limitations of Value of Products data, see text, p. 176.  
<sup>3</sup> Value of products less cost of materials, supplies, fuel, and purchased energy.  
<sup>4</sup> Rated capacity of horsepower equipment.  
<sup>5</sup> The figures for 1899 to 1929, inclusive, have been revised by the deduction of the data for railroad repair shops (both steam and electric), for the industries "coffee and spice, roasting and grinding," "flax and hemp, dressed," "gas, manufactured, illuminating and heating," and "peanuts, walnuts, and other nuts, processed or shelled," and also for "motion pictures, not including projection in theaters," where the figures had not been previously deducted. The figures for the "automobile repairing" industry also have been deducted from the statistics for 1914 and 1919, the only years for which this industry was canvassed. For 1914 not every item was tabulated separately for establishments reporting products valued at less than \$5,000 and therefore the information necessary for making such adjustments was not available in all cases.  
<sup>6</sup> Includes cost of contract work.  
<sup>7</sup> Value of products less cost of materials, supplies, fuel, purchased electric energy, and contract work. Not strictly comparable with figures for years prior to 1935.  
<sup>8</sup> Not called for on schedule.  
<sup>9</sup> Figures not available.  
<sup>10</sup> Not including data for salaried officers of corporations and their salaries and therefore not strictly comparable with figures for other years.  
<sup>11</sup> No data.  
<sup>12</sup> Includes establishments having products valued at \$5,000 or more.  
<sup>13</sup> Includes establishments having products valued at \$500 or more.  
<sup>14</sup> No comparable data.  
<sup>15</sup> Reduced to gold basis.

<sup>1</sup> Includes only sulphuric acid made in chemicals, not elsewhere classified. For 1914-31, the data are as given by the Census. For other years, quantities have been estimated: For 1933-39 on basis of average ratio for 1925-31 of sulphuric acid made in the industry to the total, wherever made; and for 1899-1909 on the basis of average ratio for 1914-23.  
<sup>2</sup> Includes only soda ash made for sale.  
<sup>3</sup> Includes gasoline, naphtha, benzine, tops (except in 1937) and, prior to 1919, other light products of distillation. In 1919, other light products of distillation amounted to 97.3 million gallons.

<sup>4</sup> Includes electric and gas except for 1939 which represents electric only.  
<sup>5</sup> Not available.  
<sup>6</sup> Revised figure.  
<sup>7</sup> Not strictly comparable with other years because of incompleteness of data.  
<sup>8</sup> In 1923 a small quantity of book paper (plate, lithograph, map, and woodcut) was excluded from this series and combined with "other paper."

<sup>1</sup> Electric only after 1920; "all other" only prior to 1910; between 1910 and 1920 preponderately electric.

<sup>2</sup> Barrels of not more than 31 wine gallons. Includes data for Alaska, Hawaii, and Puerto Rico.

<sup>3</sup> In computing taxable gallons all fractional parts of a proof gallon less than one-tenth are excluded.

<sup>4</sup> Data relate to products manufactured in continental United States, excluding those manufactured in bonded manufacturing warehouses. Figures refer to large and small cigarettes and small cigars.

<sup>5</sup> "Scoured" wool plus "greasy" wool reduced to a scoured basis, assuming average yields varying with class, origin, grade, and whether shorn or pulled.

<sup>6</sup> Figures beginning with 1930 are not strictly comparable with earlier years owing to the fact that large quantities of heavy footwear now included with men's shoes were included with "Athletic" (not shown here) prior to 1927. Data for men's shoes for 1941-1944 include government shoes.

<sup>7</sup> The quantities are in running bales, except for 1840 to 1870, which are in equivalent 500-pound bales.

<sup>8</sup> Includes all spindles active on cotton at some time during the year.

<sup>9</sup> Includes data for Government shoes.

<sup>10</sup> Alcoholic content limited to 3.2 percent by weight from April 7 to December 5, 1933.

<sup>11</sup> Includes 1,538,788 barrels, produced prior to April 7 (effective date of the Act of March 22, 1933).

<sup>12</sup> No legal production.

<sup>13</sup> Does not include foreign cotton.

<sup>14</sup> Cotton mills only.

## Chapter K. Transportation (Series K 1-273)

### Railroads: Series K 1-93

**K 1-93. General note.** Because of the long period during which it has been under Federal regulation, and because of the degree of its consolidation, there is an extensive coverage of important statistical items relating to the railway industry. *The Statistics of Railways in the United States*, published annually by the Interstate Commerce Commission since 1888, is the most important source for steam railway statistics. Various other periodical reports are also issued by the Interstate Commerce Commission. The Association of American Railroads supplements official railway statistics with various publications and releases.

The term "steam railways", as used here, includes electrified divisions operated by such carriers. Following are descriptions of the classes of railways condensed from the source volume, 1944 issue, p. 1. Steam railway *operating* companies are those whose officers direct the actual transportation service and whose books contain operating as well as financial accounts. *Lessor* companies maintain a separate legal existence, but their properties are operated by the lessees. *Proprietary* companies are also nonoperating companies. Their outstanding capitalization is owned by other railway companies. *Circular* indicates roads (operating or nonoperating) for which brief circulars showing date of incorporation, mileage, and a few other facts were filed with the Interstate Commerce Commission. They include intrastate roads and roads under construction. *Unofficial* indicates roads for which official returns were not received (by the ICC), the figures having been taken from the returns by carriers in prior years, and items contained in railway and engineering periodicals and newspapers, corrected in accordance with the best information available.

*Switching* and *terminal* companies are those operating separately for joint account or for revenue. Services such as those of switching and terminal companies are mostly performed directly by the line-haul carriers as an ordinary part of their business. *Line haul* denotes train movements between terminals and stations on main and branch lines of the road, exclusive of switching.

For statistical purposes, operating companies have been classified since 1911 on the basis of operating revenues. Those of class I have annual revenues of above \$1,000,000; class II above \$100,000; class III below \$100,000. Companies are not reclassified every year.<sup>1</sup> The relative importance of class I railroads has increased since 1911 because of the growth of traffic and the absorption of small roads in larger systems. The ratio of operating revenues of class I line-haul companies to the total revenues of classes I, II, and III was 96.48 percent in 1911, 97.45 percent in 1916, 98.07 percent in 1926, 98.76 percent in 1941, and 99.06 percent in 1945.

A collection of definitions of words or phrases frequently used in discussions of railway statistics has been issued by the Interstate Commerce Commission, entitled *Railway Statistical Terms*, Statement No. 4119, June 1941. For financial terms, see Interstate Commerce Commission, *Uniform System of Accounts for Steam Railroads*.

### RAILROADS BEFORE 1890 (K 1-27)

**K 1-17. Railroads: Mileage, equipment, and passenger and freight service, 1830-1890.** SOURCE: Interstate Commerce Commission, Statement No. 32151, *Railway Statistics Before 1890*, Washington, 1932 (mimeographed). The source document was

<sup>1</sup> If the revenues of a class I company fall below \$1,000,000, it may nevertheless be retained in class I until a permanent change is in prospect.

prepared by copying data from the various annual issues of *Poor's Manual of Railroads, 1869-1900*.

For detailed figures on miles built, and existent, see also *Tenth Census Reports*, vol. IV, *Report on the Agencies of Transportation in the United States*, section by Armin Shuman, entitled "Statistical Report of the Railroads of the United States, 1880." In that report (pp. 289-293, 300-375) the materials on history of construction include figures on mileage built and existent, by groups of States, for individual companies, annually from 1830 to 1880. The same data were carried forward to 1890, in somewhat different form in *Report on Transportation Business in the United States at the Eleventh Census: 1890*, part 1, section by Henry C. Adams on "Statistics of Steam Railroad Transportation," pp. 3-5, 54-107. Data for 1890 shown in these series do not agree with 1890 data shown for series K 28-51 because of differing sources.

**K 18-27. Railroads: Capital, property investment, income and expenses, 1850 to 1890.** SOURCE: See text for series K 1-17.

### RAILROADS, 1890-1945 (K 28-93)

**K 28-51. Mileage, equipment, passenger and freight service, for operating steam railways, 1890-1945.** SOURCE: Interstate Commerce Commission, *Statistics of Railways in the United States, 1944 and 1945*, table 155. See also general note, series K 1-93, above. No attempt has been made to adjust these figures for the effect of changes in methods of accounting or reporting, hence the data for the various years are often only approximately comparable.

**K 28. Number of operating steam railways, 1890-1945.** SOURCE: See text for series K 28-51. For definition of the terms, *operating*, *circular*, and *unofficial*, see general note for series K 1-93.

**K 29-33. Mileage of operating steam railways, 1890-1945.** SOURCE: See text for series K 28-51. For series K 30, see Ass'n of Amer. R. R., *Growth of Railway Mileage in the U. S. . .* (mimeo.), and *Statistical Abstract, 1947*, p. 507.

*Road owned* (series K 29) refers to the mileage of track owned by reporting companies. *Mileage of track operated* (series K 30) represents the mileage operated by the same companies and includes a certain amount of duplication in track mileage figures as a result of trackage rights agreements. Under an agreement as to trackage rights, more than one railway company may be operating track which only one owns. Duplication in reporting occurs because each company includes in its total mileage of track operated, the track operated under trackage rights. *Miles of road* (series K 31) refers to miles of first main track only.

**K 34-38. Equipment, 1890-1945.** SOURCE: See text for series K 28-51. *Tractive effort* (series K 35) refers to the force in pounds exerted by powered equipment which for statistical purposes is measured at the rim of the driving wheels.

**K 39-42. Passenger service, 1890-1945.** SOURCE: See text for series K 28-51.

*Passenger revenue* (series K 39) does not include revenue from passenger services such as handling of excess baggage or mail; sleeping and parlor or chair car reservations; dining and buffet service on trains; station, train, and boat privileges; parcel rooms; storage of baggage; or other miscellaneous services and facilities connected with the transportation of passengers. Revenue from transportation of passengers depends upon the established tariffs (the published schedule of rates and fares) and does include extra fares on limited trains, additional railway fares for the exclusive use of space, mileage and scrip coupons honored, and revenue from the transportation of corpses. *Revenue per passenger mile* (series

**K 42** is derived by dividing passenger revenue (series **K 39**) by passenger miles (series **K 41**).

**K 43-51. Freight service, class I, II, III railways, 1890-1945.** SOURCE: See text for series **K 28-51**. These data are for *revenue freight* only; that is, shipments from which earnings accrue to the carrier on the basis of tariff rates.

*Freight revenue* (series **K 43**) represents revenue from the transportation of freight and from transit, stop, diversion, and re-shipment arrangements upon the basis of tariffs. It does not include freight service revenue from such activities as switching of freight-train cars; water transfers of freight, vehicles, and livestock; movement of freight trains at a rate per train-mile or for a lump sum; storage of freight; demurrage; grain elevators; stockyards; or other miscellaneous services and facilities connected with the transportation of freight.

*Revenue tons originated* (series **K 44**) refers to shipments not identified as having had previous line-haul transportation by other rail carriers; such shipments include import traffic and traffic from outlying possessions of the United States received from water carriers at the port of entry, and finished products from transit points.

A *revenue ton-mile* represents the movement of a ton of 2,000 pounds of revenue freight a distance of one mile.

**K 52-59. Tons of revenue freight originated, class I railways, 1911-1945.** SOURCE: For 1911-1944, see Association of American Railroads, Bureau of Railway Economics, *A Statistical Record of Railroad Transportation in the United States*, Washington, D. C., October 1945, p. 16; for 1945, see Interstate Commerce Commission, *Statistics of Railways in the United States*, 1945, table 50, p. 41. All data shown here are derived from the annual issues of *Statistics of Railways in the United States*.

For a definition of *revenue freight originated*, see text above for series **K 43-51**. A *carload*, for statistical purposes, is a shipment of not less than 10,000 pounds of one commodity from one consignor to one consignee. See also general note for series **K 1-93**.

**K 60-67. Capital and property investment, class I, II, and III railways and their lessors, 1890-1945.** SOURCE: See text for series **K 28-51**. See also general note for series **K 1-93**.

*Investment in road and equipment* (series **K 60-61**) refers to the cost of railway companies of land, fixed improvements such as roadbed and track, and rolling stock acquired for transportation purposes, which are owned by them, including property held under contract for purchase. *Book investment* (series **K 60**) represents the amount at which assets are recorded in the accounts of carriers; also called ledger value. *Depreciation reserve* (series **K 61**) represents the fund established by companies to offset the loss in service value not restored by current maintenance. The loss in value is incurred in connection with the consumption or prospective retirement of physical property in the course of service from causes against which carriers are not protected by insurance, which are known to be in current operation, and the effect of which can be forecast with a reasonable approach to accuracy. *Funded debt unmatured* (series **K 65**) refers to unmatured debt maturing more than two years from date of issue.

**K 68-70. Capital expenditures for additions and betterments, class I railways, 1921-1945.** SOURCE: Association of American Railroads, Bureau of Railway Economics. For 1921-1945, see *Railroads in This Century*, Washington, D. C., July 1947, p. 11.

*Additions* comprise: Additional facilities such as additional equipment (rolling stock), tracks, buildings and other structures; additions to such facilities, such as extensions to tracks, buildings and other structures; additional ties laid in existing tracks; and additional devices applied to facilities such as air brakes applied to cars not previously thus equipped.

*Betterments* comprise improvements of existing facilities through the substitution of superior parts for inferior parts retired, such

as the substitution of steel-tired wheels for cast wheels under equipment, the application of heavier rail in tracks, the strengthening of bridges by the substitution of heavier members, and the application of superior floors or roofs in buildings.

**K 71-81. Income and expenses, and interest and dividends, 1890-1945.** SOURCE: See text for series **K 28-51**. See also general note for series **K 1-93**.

*Operating revenue* (series **K 71**) represents the money which carriers become entitled to receive from transportation and from operations incident thereto. *Operating expenses* (series **K 72-74**) represent the expenditures and charges for maintaining railway property and conducting transportation and incidental services, including accruals for depreciation. *Operating income* (series **K 75**) represents the net revenue from railway operations (operating revenue minus operating expenses) less railway tax accruals. *Tax accruals* (series **K 76**) are taxes imposed by any form of government whether based on an assessed value of the property, on amounts of stocks and bonds, on earnings, income, dividends declared, pay roll, number of passengers, quantity of freight, length of road, rolling stock or other basis. Tax accruals do not include special assessments for street and other improvements, nor special benefit taxes such as water assessments.

*Net operating income* (series **K 77**) represents operating revenue remaining after considering operating expenses, tax accruals, equipment rents, and joint facility rents (rents for use of yards, tracks, station, terminals, and other facilities used in common with others). *Net income* (series **K 78**) is the remainder after deducting from total income the following: Miscellaneous deductions from income, fixed charges, and contingent charges. *Dividends declared* (series **K 80**) are the returns to stockholders declared payable from income or surplus on actually outstanding capital stock issued or assumed by carriers. For definition of *funded debt*, see text for series **K 60-67**.

**K 82-83. Employment and wages, 1890-1945.** SOURCE: See text for series **K 28-51**. An *employee* as defined here is a person in the service of a railway, subject to its continuing authority to supervise and direct the manner of rendition of his service. Persons such as lawyers engaged to render only specifically defined service for specific cases and not under general or continuing retainer are not classed as employees.

**K 84-93. Railway accidents and fatalities, 1891-1945.** SOURCE: Interstate Commerce Commission, *Accident Bulletin—No. 114, Summary and Analysis of Accidents on Steam Railways . . .*, 1945. The Accident Reports Act approved May 1910 requires the filing of monthly reports of railway accidents and authorizes the Interstate Commerce Commission to investigate accidents. A *reportable accident* is one arising from the operation of a railway resulting . . . in the death of a person; or in the disability of an employee for more than 3 days during the 10 days following the accident; or in the disability of others for more than 1 day.

### Shipping and Water Traffic: Series K 94-173

**K 94-173. General note.** Basic governmental sources of historical merchant-marine and water-traffic statistics of the United States include *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2, which cover the period 1789-1823; the various annual issues of *Foreign Commerce and Navigation of the United States*,<sup>2</sup> beginning in 1821, currently prepared by the Department of Commerce, Bureau of the Census; the *Annual Report of the Commissioner of Navigation*, 1884-1923, originally prepared by the Treasury Department, later by the Department of Commerce and Labor, and finally by the Department of Commerce; annual issues of *Merchant Marine Statistics*, 1924 to the present, originally prepared by the Department of Commerce to take the place of the statistical section of the *Annual Report of the Commissioner of Navigation*, and now issued annually by the Treasury

<sup>2</sup> Before 1888, this publication was titled *Commerce and Navigation . . .*

Department, Bureau of Customs; and the various annual issues of the *Annual Report of the Office of the Chief of Engineers*, United States Army.

Congressional documents also are a prolific source of historical series on the merchant marine, foreign commerce, and related fields. Such documents frequently contain special reports prepared by Government Bureaus, with charts, and discussive and interpretative material, in addition to background information brought out in the hearings on the particular bill or subject. For the period 1789-1882, a particularly valuable collection of documents was found in the library of the Department of Commerce, bound together under the title *Decadence of American Shipping and Compulsory Pilotage*. The documents included are as follows: *Foreign Commerce and Decadence of American Shipping*, comprising H. R. Exec. Doc. No. 111, 41st Congress, 2nd Session; *Causes of the Reduction of American Tonnage and the Decline of Navigation Interest . . .* comprising H. R. Report No. 28, 41st Congress, 2nd Session; *Foreign Commerce and the Practical Workings of Maritime Reciprocity*, comprising H. R. Exec. Doc. No. 76, 41st Congress, 3rd Session; *Causes of the Decadence of Our Merchant Marine; Means for Its Restoration and the Extension of Our Foreign Commerce*, comprising H. R. Report No. 342, 46th Congress, 3rd Session; *American Shipping*, comprising H. R. Report No. 1827, 47th Congress, 2nd Session; *American Merchant Marine*, comprising H. R. Report No. 363, 48th Congress, 1st Session; *Ship-Building and Ship-Ownning Interests*, comprising H. R. Report No. 750, 48th Congress, 1st Session; and reports of lesser interest, comprising H. R. Mis. Doc. No. 37 and Report No. 1848, both of the 48th Congress, 1st Session.

For the period since 1921, publications of the U. S. Maritime Commission and its predecessor agencies (U. S. Shipping Board Bureau, Department of Commerce, and the U. S. Shipping Board) also should be consulted, particularly the reports entitled, *Ocean-Going Merchant Fleets of Principal Maritime Nations, Iron and Steel, Steam and Motor, Vessels of 2,000 Gross Tons and Over*, issued quarterly or semiannually, 1921-1941, and *Employment of American Flag Steam and Motor Merchant Vessels of 1,000 Gross Tons and Over*, issued quarterly, 1923-1941. Finally, the Bureau of the Census has published the results of five censuses of water transportation, as follows: 1880, 1889, 1906, 1916, and 1926. No data from these censuses are included here; for coverage of the censuses, see general note for series K 94-131, below.

#### MERCHANT FLEET (K 94-131)

**K 94-131. General note.** SOURCES: Basic governmental sources for statistics in this field are listed in the general note for series K 94-173, above. For the period 1789-1936, the statistics used here are from *Merchant Marine Statistics, 1936*; for 1937-1945, data are from subsequent annual issues, supplemented by records of the Bureau of Customs, Treasury Department. The text statements, and the correction of copying and typographical errors observed in historical tables, are based on reference to the primary antecedent sources, as follows: For 1789-1823, see *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2 (published in 1834); for 1821-1892, see annual issues of *Commerce and Navigation of the United States* (titled *Foreign Commerce and Navigation . . .*, beginning in 1888); for 1884-1923, see issues of *Annual Report of the Commissioner of Navigation*; for 1924-1945, see annual issues of *Merchant Marine Statistics*. These publications provide statistics in copious detail and cover many subjects which space problems have excluded from this edition of *Historical Statistics*. Historical tables will be found in these source volumes up to and including *Merchant Marine Statistics, 1936*.

Of the U. S. Maritime Commission reports cited in the general note for series K 94-173, above, the first, *Ocean-Going Merchant Fleets . . .*, provides data for each leading maritime nation on ocean-going merchant vessels of 2,000 gross tons and over, showing number and tonnage of such fleets classified by age, speed,

size, boilers, engines, draft, etc., by major vessel type. The second, *Employment of American Flag Steam and Motor Merchant Vessels . . .*, shows for seagoing merchant vessels of 1,000 gross tons and over the number and tonnage of such vessels employed in United States foreign and domestic trade, arranged by major vessel type, ownership (government and private), and area in which operating. Statistics from these reports are not included in this edition of *Historical Statistics*.

With respect to the five censuses of water transportation which were taken by the U. S. Bureau of the Census (see general note for series K 94-173, above), the first census, which was for the year 1880, was limited to steam vessels. In addition to detailed data for the census year, the report includes a detailed history of steam navigation in the United States with separate discussion and single-year construction statistics by geographic region, from the beginning to 1880. (See *Report on Steam Navigation in the United States*, by T. C. Purdy, in *Tenth Census Reports, 1880*, vol. IV.) A shipbuilding census also was taken the same year. The report includes a detailed technical history of shipbuilding in all aspects, with particular reference to sailing craft. Single-year figures are shown for New England shipbuilding, 1674-1714, classified by type of vessel and place where built. (See *Report on the Ship-Building Industry of the United States*, by Henry Hall, in *Tenth Census Reports, 1880*, vol. VIII.)

The second census (1889), and third census (1906), each included all classes of vessels. However, the 1889 census included fishing vessels for the Pacific Division only; the 1906 included no fishing vessels. The fourth and fifth censuses (1916 and 1926) provided data for all American, documented and undocumented, vessels and craft of 5 tons net register and over, whether propelled by machinery, or sails, or unrigged, except: Yachts of 15 gross tons or under; stationary wharf boats, scows, or craft used for storage purposes; houseboats without propelling machinery; craft operating exclusively on the waters of the Philippine Islands, or between these islands and foreign ports; noncommercial vessels owned by the Federal Government; and American-owned vessels under foreign registry. (See Department of Commerce, Bureau of the Census, *Water Transportation, 1926*, p. 5.) While the reports of the census of 1850 and those of the census of 1860 contain some statistics relating to water transportation, these statistics apparently were collected by other agencies.

Census statistics on water transportation are not included in this edition of *Historical Statistics*. For reports of these censuses, see *Tenth Census Reports*, vol. IV, *Report on Agencies of Transportation, 1880*; *Eleventh Census Reports, Report on Transportation Business*, part 1, "Transportation by Water"; *Transportation by Water, 1906*; *Water Transportation, 1916*; and *Water Transportation, 1926*. All of these are reports of the Bureau of the Census or its predecessor, the Census Office.

*Definitions.* The following definitions are those currently applicable. Data shown here are for documented merchant vessels only, exclusive of yachts.

*Documented vessels* include all vessels granted registers, enrollments and licenses, or licenses, as "vessels of the United States," and as such have certain benefits and privileges. Vessels of 5 net tons and over owned by citizens of the United States and otherwise complying with the requirements for documentation may be documented to engage in the foreign or coasting trades or the fisheries.

*Registers* are ordinarily issued to vessels engaged in the foreign trade or the whale fisheries. Historically, this group has included the major portion of the whaling fleet.

*Enrollments and licenses* are issued to vessels of 20 net tons and over engaged in the coasting trade or fisheries.

*Licenses* may be issued to vessels of less than 20 net tons engaged in the coasting trade or fisheries.

*Undocumented craft* are those not registered, enrolled, or licensed. Barges, scows, lighters, and canal boats, without any pro-

elling power of their own, operated exclusively in a harbor, on the canals or other internal waters of a State, or on the rivers or lakes of the United States, not in any case carrying passengers, and vessels under 5 net tons are exempt from the requirements of the laws governing documentation.

*Gross tonnage* refers to space measurement, 100 cubic feet being called 1 ton; it is not a measure of weight. *Gross tonnage* is the capacity of the entire space within the frames and the ceiling of the hull, together with those closed-in spaces above deck available for cargo, stores, passengers, or crew, with certain minor exemptions. Before Jan. 1, 1865, 95 cubic feet equalled one ton, and the admeasurement method differed in other respects.

*Changes in maritime law: Admeasurement method.* "Admeasurement" refers to the method of calculating gross tonnage of ships or vessels. The first law of the United States on the subject appears to have been enacted September 1, 1789 (1 Stat. 55; that is, vol. 1 of *United States Statutes at Large*, p. 55). The enactment then made was reenacted with certain minor amendments in the Acts of August 4, 1790 (1 Stat. 169) and of March 2, 1799 (1 Stat. 675), and as so enacted was in force until January 1, 1865.

A basic change in admeasurement method was provided in the Act of May 6, 1864, effective January 1, 1865 (13 Stat. 70-72, R. S. 4153, 46 U. S. C. 77. That is, vol. 13 of *United States Statutes at Large*, pp. 70-72; *Revised Statutes of the United States*, sec. 4153; or Title 46 in *United States Code*, sec. 77). The method described in the Act of May 6, 1864, appears to have been substantially the same as that in force in 1945.

For the transition period, 1865-1868, the total tonnage figures for the fleet are "mixed". That is, during those years, the total fleet tonnage was obtained by combining the "old admeasurement" tonnage of vessels not yet readmeasured and the "new admeasurement" tonnage of vessels which had been readmeasured or newly built. For a recapitulation of the "old" and "new" components of the fleet tonnage (not the same vessels) for each year, 1865-1868, see *Commerce and Navigation, 1870*, p. 798.

No table has been located comparing the tonnage of a substantial number of vessels under "new" and "old" admeasurement; hence, neither the magnitude nor the direction of the change can be stated here. Apparently it varied for different types of vessels. That is, "brigs, schooners, and sloops measure less under the 'new' admeasurement . . . while ships, barks, steam boats, and vessels having closed-in spaces above their hulls have their tonnage largely increased." Further, the difference between "old" and "new" was not believed to affect a comparison of New England shipbuilding for the years 1855 and 1868. (See *Treasury Annual Report, 1868*, p. 496.)

*Changes in maritime law: Exemptions from documentation.* Another type of change in maritime law affecting the statistics is illustrated by the Act of April 18, 1874 (18 Stat. 31), which exempted the greater amount of canal boat and other unrigged tonnage from documentation. (See U. S. Code, title 46, sec. 336.) For the years 1874-1876, the "balance sheets of tonnage," published annually in the source volumes, record the removal of 879,000 tons of vessels for this reason alone. (These "balance sheets" explain by category the increases and decreases in tonnage for the given year.) However, *Merchant Marine Statistics, 1936*, lists 843,000 tons exempted in 1876, whereas the 1876 balance sheet of tonnage specifies 601,000 tons exempted. The reason for this discrepancy is not clear.

The tonnage exempted annually, 1874 to 1936, is shown on pp. 54-55 of *Merchant Marine Statistics, 1936*; these data are included in the present volume as a component of series K 118.

*Problems in statistical reporting: Clearance of tonnage accounts.* At irregular intervals, steps were taken to clear (remove) from the tonnage accounts those vessels lost, abandoned, captured, sold to aliens, etc., which had not been officially reported for removal purposes. From the outset, the failure to remove such ves-

sels annually resulted in a cumulative error which inflated the statistics of tonnage. When general clearances of this cumulative error were made, the effect was concentrated in a single year or small group of years.

For a basic statement on this subject, see *American State Papers: Class IV, Commerce and Navigation*, vol. 1, p. 494, where Albert Gallatin, Secretary of the Treasury, outlines the problem and discusses the first attempt (1800) to deal with it. Recurrently, in the annual tonnage reports found in the source volumes, the problem is discussed, the announcement is made that the rolls have been finally cleared, and assurance is given that the problem has been solved for the future. However, as late as 1867, in spite of repeated clearances in earlier years, the "First Annual Report of the Director of the Bureau of Statistics" stated, "The tonnage returns were swelled with thousands of ghostly ships—ships that had gone to the bottom years ago." (See *Annual Report of the Secretary of the Treasury, 1867*, p. 244.)

In 1869, the Register of the Treasury attributed the entire decline of tonnage reported for 1869 to this factor. (See *Treasury Report, 1869*, p. 300.) In the same year, Francis A. Walker, Deputy Special Commissioner of Revenue in Charge of the Bureau of Statistics, stated that the process of assigning a number to each vessel and the institution of an annual list of vessels, as required by the Act of July 28, 1866, "has succeeded in clearing from the lists of vessels . . . a vast amount of purely fictitious tonnage, which had been carried forward from year to year [although] thousands of vessels which this tonnage originally represented had been meanwhile lost at sea, broken up, or sold abroad." (See *Treasury Report, 1869*, p. 342.)

In the "balance sheets of tonnage" published annually in the source volumes, clearances of cumulative error are generally identified as "not heretofore credited" to distinguish them from listings of removals of the various types routinely reported as having occurred during the given year.

Some of the more important clearances of this cumulative error, and the tons of shipping thereby removed, were: 1800-1801, 197,000; 1811, amount not stated but the effect is evident in series K 95; 1818, 182,000; 1829-30, 604,000; 1837, 96,000; 1841-42, 267,000; and 1855-58, 945,000.

In later years, the terms "obsolete," "obsolete, not heretofore reported," and "correction of balance" found in annual balance sheets of tonnage, frequently reflect removal of cumulative errors. Examples are (in tons): 1864, 188,000; 1866, 1,063,000; 1867, 260,000; 1868, 128,000; 1869, 338,000; 1870, 58,000; 1871, 103,000; 1881, 157,000. These major clearances are inadequately reflected in series K 118. It is not clear why these and other items in the annual balance sheets of tonnage do not correspond with additions and removals recorded in series K 106-118.

*Data shown for 1789-1818.* For 1789-1793 (series K 95-104), tonnage figures are the "duty tonnage," that is, the tonnage of vessels on which duties were collected during the year. (See *American State Papers: Class IV, Commerce and Navigation*, vol. 1, p. 895.) The "duty tonnage" appears to have been the tonnage on which duties were collected on registered vessels, including "the repeated voyages of the same vessel," plus tonnage of the enrolled and licensed vessels which paid tonnage duties once each year. (See *American State Papers*, same volume, pp. 494, 498, 528.) Beginning 1794, "district tonnage returns" were used, derived from reports of District Collectors of Customs, which gave the tonnage of vessels in each district based on registers, enrollments, and licenses outstanding, as of Dec. 31.

For 1794-1801, figures are district tonnage returns, with no attempt to correct for the cumulative error caused by failure to remove vessels lost, abandoned, sold to aliens, etc. (See *American State Papers*, same volume, pp. 494, 499.) The figures for 1800-1801 ignore the first clearing of tonnage accounts which took place

during these years. (See *American State Papers*, same volume, pp. 494-499, 527-531.) The correction for the cumulative error for registered vessels only would reduce the 1800 total to 819,571 tons and the 1801 total to 903,235 tons. The sharp drop attributable to the clearing of tonnage accounts would thereby be shifted back to 1800 instead of appearing in 1802. However, see the "actual tonnage" series shown in table 1 and discussed below.

For 1802 to 1818, the figures in series K 95 consist of the "corrected registered" tonnage plus the enrolled or licensed tonnage "which hath not yet been corrected" (as it was described in the 1813 tonnage report in *American State Papers: Class IV, Commerce and Navigation*, vol. 1, p. 1017). The figures for 1811 and 1818 reflect two additional attempts to clear out the cumulative error of registered vessels improperly retained on the registers. (See *American State Papers: Class IV, Commerce and Navigation*, vol. 1, pp. 876, 958, and vol. 2, p. 406.)

"Actual" tonnage, 1800-1818. The figures shown in table 1 are those which were derived by a method authorized by Secretary of the Treasury Gallatin. They were reported to Congress in the annual tonnage reports in *American State Papers* as being the "actual" or "more nearly correct" tonnage.

These were obtained by taking the "corrected registered tonnage" and adding to it the "duty tonnage" for enrolled and licensed vessels. Since duties were paid only once each year on enrolled and licensed vessels, and owners were not likely to pay duties on nonexistent vessels, it was reasoned that the lower "duty tonnage" figure more accurately reflected the true total for the enrolled or licensed craft than did the district returns of tonnage based on outstanding marine documents. This correction for enrolled and licensed craft was dropped after 1818, probably because, beginning 1819, the "duty tonnage" for this group exceeded the district tonnage returns for the group.

TABLE 1.—"ACTUAL TONNAGE" OF DOCUMENTED VESSELS:  
1800 TO 1818

[In thousands of gross tons]

YEAR	Tons		YEAR	Tons	
	95a			95a	
1818.....	1,150		1808.....		1,173
1817.....	1,341		1807.....		1,208

1810.....	1,329		1800.....		768
1809.....	1,266				

In this connection it may be observed that, in *American State Papers: Class IV, Commerce and Navigation*, vol. 1, p. 499, the tonnage described as "actual tonnage" in the comparative table for 1794-1799 is, in fact, the district returns of tonnage without correction of any kind. Elsewhere in the tonnage report for 1800 (pp. 494-499), and in tonnage reports for later years, the term "actual tonnage" normally means the district returns based on outstanding marine documents (registers, enrollments, and licenses) corrected for cumulative error. In table 1, the term "actual tonnage" is used in the latter sense; the figures are from annual tonnage reports, 1800-1818, in *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2.

Conflicts, typographical errors, and omitted footnotes. Other factors which require that historical interpretation of merchant-vessel statistics should be made with some caution are the following: (1) In some instances, systematic differences in identically described statistical series appear in the source volumes (see text

for series K 119-123 discussing shipbuilding series K 107 and K 120) which reflect conflicting series of figures, possibly originating from different primary sources of data (see table 2); (2) transcription and typographical errors have crept into historical tables in the source volumes in the process of repeated recopying and retypesetting during the past 150 years; and (3) statistically significant footnotes which appeared in early reports frequently were dropped in later years.

TABLE 2.—MERCHANT MARINE TONNAGE—CHANGES IN FIGURES FROM THOSE SHOWN IN SOURCE

[ "Source" is *Merchant Marine Statistics, 1936* ]

SERIES No.	Year	In source volume	In this volume
K 94.....	1868	1 28,118	1 28,167
K 95.....	1886	2 4,131,116	2 4,131,136
	1868	4,818,309	4,351,758
	1817	1,339,912	1,399,912
	1815	1,368,182	1,368,128

	1910	184,239	174,239
	1892	60,710	60,770

<sup>1</sup> Number of vessels. <sup>2</sup> As shown in table 10, p. 16, of source. <sup>3</sup> As shown in table 16, p. 30, of source. <sup>4</sup> As shown in table 10, p. 14, of source. <sup>5</sup> As shown in table 16, p. 28, of source.

Finally, (4) caution is suggested in referring back to the earlier volumes in the search for explanations of discrepancies or major changes, since the earlier *historical* table found may reflect the same or similar errors. Where discrepancies in historical data are encountered in the source volumes, it is suggested that the detailed tables be consulted in the volume for the year in question.

To locate and to clear up all discrepancies of the types noted above would require exhaustive research in the source publications. In this edition of *Historical Statistics*, a number of the copying and typesetting errors have been corrected where the exact nature of the discrepancy could be settled quickly beyond reasonable doubt; several broad differences in figures have been pointed out; and a few detailed tabular notes have been added based on notes found, or situations observed, in various annual issues selected largely at random. In the tabular presentation for series K 94-131, boldface is employed for figures which differ from those shown in *Merchant Marine Statistics, 1936*. Also, for convenience in reference, these changes are listed in table 2.

**K 94-95. Documented merchant vessels: Total number, 1868-1945; and gross tonnage, 1789-1945.** SOURCE: For 1789-1936, see *Merchant Marine Statistics, 1936*, pp. 14-17; for 1937-1945, data are from subsequent annual issues, supplemented by records of the Bureau of Customs, Treasury Department. See also general note for series K 94-131.

Figures for 1789-1793 are for "duty tonnage"; that is, for vessels on which tonnage duties were paid during the year ending Dec. 31, except that figures for 1789 are for the last 5 months of the year only. Figures for 1794-1945 represent documented vessels as of Dec. 31 for 1794-1834; Sept. 30, 1835-1842; June 30, 1843-1940; Jan. 1, 1941-1945.

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.) Two special cases are: (1) In series K 94 and K 95, the figures for 1868 (28,167 vessels and 4,351,758 tons) are from p. 30 of *Merchant Marine Statistics, 1936*. The figures on pp. 16 and 26 of that volume (28,118 vessels and 4,318,309 tons) fail to include 49 sailing vessels of 33,449 tons on the New England Coast which, in 1868, were still under "old admeasurement." (See *Commerce and Navigation, 1868*, pp. 45 and 93.) This tonnage correction appears also in series K 97, K 124, and K 124a. (2) In series K 95 and K 97, the 1817 figure (1,399,912 tons) from p. 28 of the source is used instead of the figure on p. 14 (1,339,912 tons) where an error of 60,000 tons in the sailing figure is carried to the total.

In series K 95, figures for 1936 and 1943 are unrevised. Revised figures, provided by Bureau of Customs, are 14,496,693 tons for 1936 and 16,761,746 tons for 1943; these equal the summation of figures in series K 99-100. However, the unrevised figures have been retained in series K 95 since detail adjustments were lacking for series K 96-98 and K 101-104.

**K 96-98. Documented merchant vessels: Major class, 1789-1945.** SOURCE: Same as for series K 94-95. See also general note for series K 94-131. For effective dates, see text for series K 94-95.

The table in the source volume on which series K 96-98 is based shows separate figures for steam, motor, canal boats, and barges.

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.) The changes for 1868 and 1817 are explained in the text for series K 94-95. The reason why the 1822 figures for series K 96-97 do not add to total in series K 95 is not clear; other distributions add to the total shown.

**K 99-100. Documented merchant vessels: Material of which built, 1884-1945.** SOURCE: For 1884, see *Annual Report of Commissioner of Navigation, 1884*, table 29, p. 161; for 1885-1936, see *Merchant Marine Statistics, 1936*, pp. 33-34; for 1937-1945, same as for series K 94-95. For effective dates, see text for series K 94-95. See also general note for series K 94-131.

The source volume classifies each material by steam, motor, sail, canal boat, and barge. Series K 99 (metal) includes iron, steel, composite, and concrete. These figures are for all documented vessels in existence on the reporting date, irrespective of year built; they are not merely for ships built during the year.

In series K 99 (metal) the figure in boldface for 1928 differs from that in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.)

**K 101-104. Documented merchant vessels: Type of trade in which engaged, 1789-1945.** SOURCE: For 1789-1936, see *Merchant Marine Statistics, 1936*, pp. 28-31; for 1937-1945, same as for series K 94-95. For effective dates, see text for series K 94-95. See also general note for series K 94-131.

The source volume shows also the number of vessels engaged in each type of trade as well as tonnage.

The statutes do not recognize for documenting purposes any fisheries except the cod and mackerel, and the whale. Vessels engaged in catching any other fish, such as salmon or menhaden, are documented for the mackerel fishery.

In early reports figures identified as "registered," or as "registered in foreign trade," commonly include the registered vessels engaged in the whale fishery. Accordingly, figures on "whale fishery" found in early reports should be examined carefully to determine whether they represent the entire whaling fleet or only the "enrolled or licensed" portion.

In terms of documentation as "registered," "enrolled," "licensed," series K 101-104, is composed broadly as follows:

K 101 (foreign trade) represents the total "registered" minus "registered whale fishery."

K 102 (coastwise and internal) represents that portion of the enrolled or licensed group engaged in this trade. The rest of the enrolled or licensed group is in series K 104 (cod and mackerel fisheries).

K 103 (whale fishery) is the "registered whale fishery" portion of the registered fleet plus the "whale fishery" portion of the enrolled or licensed fleet.

K 104 (cod and mackerel fishery) is the cod and mackerel fishery portion of the enrolled or licensed fleet. The rest of the enrolled or licensed group is in series K 102 (coastwise and internal).

Finally, the term "fisheries" as used in early volumes usually refers to cod, and later to cod and mackerel, fisheries; it rarely includes the whale fishery.

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.) Also, in series K 103 (whale fisheries) the figures for 1794 to 1798 have been identified as comprising the enrolled or licensed vessels only, excluding the "registered" whaling fleet. The "registered" whaling tonnage is in series K 101 (foreign trade) for those years.

**K 105-118. Documented merchant vessels: Changes in the merchant marine, 1813-1944.** SOURCE: For 1813-1936, see *Merchant Marine Statistics, 1936*, pp. 52-55; for 1937-1944, data in general are from subsequent annual issues and records of the Bureau of Customs, Treasury Department. See also general note for series K 94-131.

These figures represent vessels added to, or removed from, documentation during a twelve-month period, except where a change was made in the terminal date. Terminal dates of reporting periods are Dec. 31, 1813-1834; Sept. 30, 1835-1842; June 30, 1843-1940; Dec. 31, 1940-1944. Figures for 1835 and 1843 are for 9 months; figures for periods ending June 30, 1940, and Dec. 31, 1940, are each for 12 months; that is, the period Jan. 1, 1940, to June 30, 1940, is included in both figures. Exception: In series K 105, figure for Dec. 31, 1940, represents six months decrease.

The exact original source of these series is not clear. From their nature it seems likely that they were derived originally from the balance sheets of tonnage published annually in the source volumes, beginning 1815. However, the figures shown in series K 105-118 vary broadly, at times, from those shown in the annual balance sheets in the original source volumes. Further, the total

increase (series K 106) and the total decrease (series K 113) do not always equal the addition of their presumed components, and the difference between these subtotals does not always equal the net increase or decrease for the fleet as a whole. The tabular note in *Merchant Marine Statistics, 1936*, indicating that tonnage figures prior to 1877 are incomplete probably refers to the detailed categories, but it explains the discrepancies only in part.

Because of the many problems involved, no attempt has been made to reconcile these series with other series in this edition of *Historical Statistics*, except that series K 105 (net increase or decrease) has been reconciled to series K 95 (total tonnage of fleet), largely by elimination of what appear to be copying errors. Also, the text for series K 107 (ships built and added to fleet) calls attention to differences for specified years between this series and series K 120 (ships built and documented).

**K 105. Documented merchant vessels: Net increase or decrease in the merchant marine, 1813-1944.** SOURCE: For 1789-1936, see *Merchant Marine Statistics, 1936*, pp. 52-55. For 1937-1944, data have been derived by taking differences for successive years in series K 95. For effective dates and general qualifications, see text for series K 105-118. See also general note for series K 94-131. The increases shown for 1835 and 1843 are for 9 months; the decrease for 1940 (Dec. 31) is for 6 months.

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.)

**K 106-112. Documented merchant vessels: Vessels added to the merchant marine, 1813-1944.** SOURCE: *Merchant Marine Statistics, 1936*. For effective dates and general qualifications, see text for series K 105-118. See also general note for series K 94-131.

The source also shows figures separately for those nationalized, renationalized, and captured from the enemy.

In series K 107 (ships built), figures for 1938-1945 are not comparable with those for earlier years and are probably understated. (See text for series K 119-123, below.) Also, in series K 107, figures for 1867, 1865, 1863, 1859, 1858, and 1815-1839 differ from those in series K 120; the reason is not clear, but series K 107 seems to be associated with the regional distribution. (See text for series K 119-123, K 127-128, and K 129-131.)

In series K 106, the figure in boldface for 1917 differs from that in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.)

**K 113-118. Documented merchant vessels: Vessels removed from the merchant marine, 1813-1944.** SOURCE: For 1813-1936, see *Merchant Marine Statistics, 1936*, pp. 52-55; for 1937-1944, data are from subsequent annual issues and records of the Bureau of Customs, Treasury Department. For effective dates and general qualifications, see text for series K 105-118. See also general note for series K 94-131.

The source also shows figures separately for ships lost at sea or missing, abandoned (as obsolete), captured by enemy, exempt from documentation, and those removed from documentation because they were found to be net under 5 tons.

In series K 113, the figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.)

**K 119-123. Shipbuilding: Merchant vessels built and documented, United States totals, 1797-1944.** SOURCE: For 1797-1936, see *Merchant Marine Statistics, 1936*, pp. 42-45; for 1937-1944, data are from subsequent annual issues and Bureau of Customs records. See also general note for series K 94-131.

Figures are for ships built during a 12-month period, except where a change is made in the terminal date. Terminal dates of reporting periods are Dec. 31, 1813-1834; Sept. 30, 1835-1842; June 30, 1843-1940; Dec. 31, 1940-1944. Figures for 1835 and 1843 are for 9 months; figures for periods ending June 30, 1940,

and Dec. 31, 1940, are each for 12 months; that is, the period Jan. 1, 1940, to June 30, 1940, is included in both figures.

The source volume shows statistics separately for steam, motor, sailing, canal boats, and barges. Motor vessels begin in 1893.

Figures for 1938-1944 are *not comparable* with those for earlier years and are probably understated. They represent those vessels built during the 12-month period which were still existent and documented as part of the merchant fleet at the end of the period. Hence, they exclude vessels completed during the period which were lost, sold to United States Government, sold alien, or otherwise removed from merchant vessel documentation before the end of the period.

For a history of shipbuilding, including single-year data for New England, 1674-1714, see *Report On the Shipbuilding Industry of the United States*, by Henry Hall, in *Tenth Census Reports* (1880); vol. 8. Vol. IV of that census includes the report on *Steam Navigation in the United States*, by T. C. Purdy, which provides single-year construction statistics and discussion, nationally and for regions, from the beginning to 1880.

In series K 120, figures for 1867, 1865, 1863, 1859, 1858, and 1815-1839 differ from those in series K 107; the reason is not clear, but series K 107 seems to be associated with the regional distribution. (See text for series K 127-128.)

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.) The reason for the failure of the 1808 figures for series K 121-122 to add to the total (series K 120) is not clear.

**K 124-126. Documented merchant vessels: Composition of merchant fleet, by regions, 1816-1945.** SOURCE: For 1816-1936, see *Merchant Marine Statistics, 1936*, pp. 25-27; for 1937-1945, data are from subsequent annual issues and records of the Bureau of Customs. For effective dates and general qualifications, see text for series K 94-95. See also general note for series K 94-131.

These figures represent a broad regional distribution for series K 95 (total merchant tonnage). The source volume also provides figures separately for Northern Lakes, and Western Rivers.

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.) Changes for 1868 in series K 124 and K 124a are explained in text for series K 94-95.

**K 127-128. Shipbuilding: Merchant vessels built and documented, by region, 1840-1936.** SOURCE: For 1840-1936, see *Merchant Marine Statistics, 1936*, pp. 46-48; data for 1937-1945 are not now available. For effective dates, see text for series K 119-123. See also general note for series K 94-131.

For 1867, 1865, 1863, 1859, and 1858, the distribution in series K 127-128 adds to series K 107, rather than to series K 120. (See text for series K 119-123, above.)

Figures in boldface differ from those in *Merchant Marine Statistics, 1936*. (See table 2 in general note for series K 94-131.)

For a history of steam navigation in the United States from the beginning to 1880, with separate discussion and statistics for each region, see *Report on Steam Navigation in the United States* in *Tenth Census Reports* (1880), vol. 4, entitled *Report on the Agencies of Transportation in the United States* . . .

**K 129-131. (Alternative series.) Shipbuilding: Merchant vessels built and documented by region, 1817-1850.** SOURCE: Data are from a table at the bottom of a fold-in chart on the history of shipbuilding (1817-1868) at the end of the *Annual Report of the Secretary of the Treasury, 1868*. In that table, figures are also shown separately, and charted, for "The United States," "The Lakes," and "Western Rivers."

The effective dates are the same as for series K 119-123, except that figures for 1835 and 1843 shown here are 12-month approximations for charting purposes, obtained by averaging the figures

for the preceding and succeeding years. This was required because the figures for 1835 and 1843 in series K 120 and K 107 are for nine months only, the fiscal-year terminal dates having been changed during those years.

For a discussion of these data, see *Treasury Report, 1868*, cited above. The same chart, with a more detailed discussion appears as Plate XXII in House of Representatives, Ex. Doc. No. 111, 41st Congress, 2nd Session, where the period covered is extended to 1869; and as Plate X (extended to 1870) in H. R. Exec. Doc. No. 76, 41st Congress, 3rd Session.

For 1815-1839, these regional data (series K 129 and K 130) add to series K 107, except that the 1828 summation approximates that for series K 120, and a minor variation appears for 1830. Series K 131 (New England States) is included in series K 129 (the Coast). For the over-lapping years, the regional detail varies considerably from that shown in series K 126-127; in part, this may be caused by differing definitions of the geographic areas.

#### WATERBORNE COMMERCE OF THE UNITED STATES (K 132-145)

**K 132-145. Waterborne commerce of the United States, 1924-1945.** SOURCES: *Statistical Abstract*, annual volumes as follows: For 1924-1926, see *Abstract, 1929*, p. 429; for 1927-1932, see *Abstract, 1934*, p. 378; for 1933-1938, see *Abstract, 1940*, p. 458; for 1939-1944, see *Abstract, 1946*, p. 530; for 1945, see *Abstract, 1947*, p. 539. Primary source is War Department, *Annual Report of Office of the Chief of Engineers, United States Army*.

*Cargo tonnage* refers to the weight of cargo in short tons of 2,000 pounds. This type of tonnage should not be confused with *gross tons* used in series K 94-131, or the *net or registered tonnage capacity* used in series K 146-157, which are measures of cubic capacity, not of weight.

#### VESSELS ENTERED AND CLEARED IN FOREIGN TRADE (K 146-157)

**K 146-157. General note. Vessels entered and cleared in foreign trade, 1789-1945.** SOURCE: See listings for individual series below. Also see general note for series K 94-131 and, for definitions, see text for series K 94-104. In general, the data are as shown in various annual volumes of the *Statistical Abstract of the United States*. Primary sources are the annual volumes of *Foreign Commerce and Navigation of the United States* and, for early years, *American State Papers: Class IV*, vol. 2.

*Net tonnage capacity*, as used here, refers to *net or registered tonnage* of the vessel, not weight of cargo. The *net tonnage* is what remains after deducting from the *gross tonnage* (defined in general note for series K 94-131, above) the spaces occupied by the propelling machinery, fuel, crew quarters, master's cabin, and navigation spaces. It represents, substantially, *space* available for cargo and passengers. It is the usual basis for tonnage taxes and port charges. The *net tonnage* capacity of a ship recorded as "entered with cargo" may bear little relation to actual weight of cargo. *Gross tonnage* and *net tonnage* are both measures of cubic capacity, not of weight, 100 cubic feet equalling 1 ton. These terms should not be confused with the *cargo ton* of 2,000 pounds as defined above in text for series K 132-145. The reason that the tonnage shown in series K 147 and K 153 for American vessels entered and cleared, respectively, in foreign trade is greater than the total tonnage of American vessels documented for the foreign trade is because the "entered" and "cleared" series include tonnage for each vessel as often as it "enters" or "clears" each year. The documented tonnage (series K 104) includes the tonnage of each vessel once for each year.

These statistics include the tonnage of all types of watercraft engaged in the foreign trade, whether entering or clearing with cargo or in ballast, which are required to make formal entrance and clearance under United States customs regulations. Vessels engaged in trade on the Great Lakes with Canada as well as in trade with Mexico are also included. Vessels touching at a United

States port in distress or for other temporary causes without discharging cargo, and Army and Navy vessels carrying no commercial cargo, are not required by customs regulations to enter or clear and thus are not included in the figures.

Vessels are credited as entered from the country in which is located the first foreign port at which cargo was laden for the United States, and are reported as cleared to the country of the first charge of cargo, or to that country to which the vessels received orders to sail in ballast.

**K 146-148. Vessels entered, all ports, 1789-1945.** SOURCE: For 1789-1820, see Guetter, Fred J., and McKinley, Albert E., *Statistical Tables Relating to the Economic Growth of the United States*, McKinley Publishing Co., Philadelphia, Pa., 1924, p. 39; for 1821-1879, see Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, part IV, table 2, p. 93; for 1880-1888, see *Statistical Abstract, 1908*, p. 286; for 1889-1916, see *Statistical Abstract, 1916*, p. 338; for 1917-1930, see *Statistical Abstract, 1931*, p. 474; for 1931-1943, see *Abstract, 1946*, p. 548; for 1944-1945, see *Abstract, 1947*, p. 557. A vessel is reported as entered at the first port in the United States at which entry is made, regardless of whether any cargo is unladen at that port. Vessels entering at subsequent ports are not included in the statistics. See also general note for series K 146-157.

**K 149. Total vessels entered at seaports, 1840-1945.** SOURCE: For 1840, see *Statistical Abstract, 1946*, p. 546; for 1844-1855, see *Abstract, 1878*, p. 134; for 1856-1879, see *Statistical Abstract, 1880*, p. 138; for 1880-1945, same source as series K 146-148. See also general note for series K 146-157.

#### VALUE OF MERCHANDISE CARRIED IN FOREIGN TRADE (K 158-167)

**K 158-167. Imports and exports of merchandise by method of carriage, 1790-1935.** SOURCES: For 1790-1820, see Guetter and McKinley (cited in text for series K 146-148), table XXVII, p. 39 (see footnote 9 on page 40); for 1821-1858, see Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, part IV, p. 91; for 1859-1866, *Statistical Abstract, 1895*, pp. 399-400; for 1867-1912, see *Statistical Abstract, 1913*, pp. 318-319; for 1913-1923, see *Statistical Abstract, 1924*, p. 417; for 1924-1935, see *Statistical Abstract, 1946*, p. 552.

The primary source for the years 1790-1820 is the article entitled "The Maritime Industries of America" by J. R. Soley, which comprises chapter X, vol. II, of *The United States of America* (N. S. Shaler, Editor), 1894, vol. I, pp. 522, 527, 534, 536, 538, and gives the percent of imports and exports in United States vessels. Guetter and McKinley have derived absolute figures by applying these percentages to total imports and exports of mer-

chandise and specie. The primary source for the years 1821-1935 is the annual *Foreign Commerce and Navigation of the United States*. Starting with 1943, import or export statistics by method of transportation showing shipping weight, as well as dollar value, have been compiled by the Bureau of the Census.

#### NEW YORK STATE CANALS (K 168-171)

**K 168-169. Ton-mileage on New York State canals, rivers, and railroads, 1853-1898.** SOURCE: United States Senate, *Preliminary Report of the Inland Waterways Commission*, 60th Congress, 1st session, Senate Document No. 325, 1908, p. 229.

The series on canals and rivers "includes estimated ton-mileage of canal traffic on Hudson River; after 1880 the entire canal ton-mileage is estimated, as no records are kept." According to the source volume, p. 217, these data "showing the relative proportions carried by the railroads of New York and the New York canals . . . is shown on pages 182 and 183 of the *Report of the New York Committee on Canals, 1899*."

**K 170-171. Tonnage moved on New York State canals, 1837-1945.** SOURCE: State of New York, Department of Public Works, *Annual Reports of the Superintendent*.

#### EXPENDITURES FOR RIVERS, HARBORS, ETC. (K 172-173)

**K 172. Federal (net) expenditures for light stations, beacons, buoys, etc., 1791-1882.** SOURCE: *Statement of Appropriations and Expenditures for Public Buildings, Rivers and Harbors, Forts, Arsenal, Armories, and Other Public Works From March 4, 1789, to June 30, 1882*, comprising United States Senate Executive Documents, vol. 7, No. 196, 47th Congress, 1st session (Treasury Department Document No. 373), pp. 521-522.

**K 173. Federal (net) expenditures for rivers and harbors, 1822-1882.** SOURCE: Same as for series K 172, p. 286.

### Road Transportation: Series K 174-238

#### PUBLIC ROADS (K 174-224)

**K 174-175. Miles of surfaced roads, 1793-1926.** SOURCE: Rose, Albert C., "Estimated and Surveyed Miles of Surfaced Roads in the United States from 1793 to 1926," Federal Works Agency, Public Roads Administration. The source document is a manuscript furnished by the author to the Bureau of the Census. The following text was condensed from the statement provided.

The first road mileage survey of the United States was made in 1904. The estimates for the years prior to 1904 were based largely on the figures of Federal expenditures for roads, bridges, and canals for the years 1802-1882, shown in series K 176. These expenditures figures were translated into miles of road built with the following assumptions: (1) The average cost per mile of surfaced road was estimated at \$2,000 on the basis of a study of the available literature; (2) Federal road expenditures were assumed to be one-tenth of total Federal, State, and local expenditures for roads, on the basis of the ratio existent in the early days of the Federal-aid road program of the present century.

In the use of early Federal road expenditure data, no deduction was made for canals—about 14 percent of total sum from 1802 to 1882—the reason being that in early days canal and road improvements were closely allied.

The years 1793-1826 (at the beginning of which period the Lancaster Pike, the first extensive surfaced road in the United States, was begun) and the years 1883-1903 were interpolated by a smooth curve. Mr. Rose states: "The missing data were arrived at upon the basic assumption that the general economic condition of the country may be measured by the total mileage of surfaced roads—the critical indicator of the degree of road improvement . . . In this connection it is interesting to observe that the shape of the surfaced road mileage curve resembles that of the curve representing the per capita money in circulation."

*Surveyed miles of surfaced roads* is so designated because in contrast to the estimating procedure used for the years prior to 1903, the data for the period 1904-1926 are based on road mileage surveys made by the various federal roads administrative agencies empowered during that period. The data for 1904-1921 are interpolations derived from four basic road mileage surveys made by these agencies in 1904, 1909, 1914, and 1921. Data for these four surveys appear in Department of Agriculture Bulletin 1279, *Rural Highway Mileage, Income, and Expenditures, 1921-1922*, by Andrew P. Anderson, March 1925. Data for 1921-1926 appear in Public Roads Administration, *Highway Statistics, Summary to 1945*, Washington, D. C., 1947, p. 60. For a continuation of series K 175 through the year 1945, see series K 182. For a definition of *surfaced road*, as against *nonsurfaced road*, see the text below for series K 184-188.

**K 176. Federal net expenditures on roads and canals, 1802-1882.** SOURCE: Same as for series K 172, p. 340. The source document contains a detailed statement of appropriations for roads and canals, with a specific listing and description of every appropriation for each State from 1802 to 1882.

**K 177-188. General note.** The U. S. Office of Public Roads conducted the first census of rural roads in 1904. The results of this survey and subsequent ones made in 1909 and 1914 indicated existing rural road mileage as follows: 1904, 2,151,371 miles; 1909, 2,199,645 miles; and 1914, 2,445,761 miles. Beginning in 1921, rural road mileages have been classified according to systems as shown here for series K 178-181. Most of the systems of State highways were established during the early years of the twentieth century and many resulted from planning to expend the Federal-aid funds provided under the Federal-aid Road Act of 1916 (see text below for series K 189-191b).

*Rural* as used here may be roughly defined as an area which lies outside of communities having more than 2,500 inhabitants. It is believed that these data, which are compiled on the basis of individual reports from the different States, are largely consistent in their adherence to this definition of rural.

**K 177-181. All existent rural roads, 1921-1945.** SOURCE: Federal Works Agency, Public Roads Administration, *Highway Statistics—Summary to 1945*, Washington, D. C., 1947. See general note, series K 177-188.

Series K 177 comprises the total of data shown for each year for series K 178-181. State highways are classified as rural primary State highways (series K 178), rural secondary roads under State control (series K 179), and urban extensions of State highway systems (series K 180). The distinction between *primary roads* and *secondary roads* is chiefly one of degree of importance. As of 1945, 30 States made no such distinction but included in one system all mileage under State control; 12 States maintained secondary systems consisting usually of roads of local but not necessarily State-wide importance; 4 States (Delaware, North Carolina, Virginia, and West Virginia) had incorporated into State systems most, or all, former county roads; and 2 States (New Jersey and Rhode Island) maintained a separate classification for State forest, park, and institutional roads.

*Urban extensions* (series K 180) are continuations of designated State-system roads in or through cities or towns of over 2,500 inhabitants.

*County and other local roads* (series K 181) are those roads over which the State exercises no control.

**K 182-183. Surfaced rural roads, 1921-1945.** SOURCE: Same as for series K 177-181. See also general note, series K 177-188, and text for series K 184-188. Series K 182 is a continuation of series K 175.

**K 184-188. Roads built by State highway departments, 1923-1945.** SOURCE: Same as for series K 177-181. *Mileage built* (series K 184) refers to all construction activities that create a new road or definitely improve the condition of an existing road, as con-

trusted to maintenance operations that are designed to maintain or restore the condition of a road without material betterment. Resurfacing and rebuilding existing roads to higher standards constitute the bulk of the mileage built.

The highest type of nonsurfaced road is the graded and drained *earth road* (series K 186). This is of natural earth, alined and graded to permit reasonably convenient use of motor vehicles, and drained sufficiently to prevent serious impairment by normal surface water. The lowest type of surfaced road (series K 188) is the soil-surfaced road, which consists of natural soil, the surface of which has been improved by the addition of one or other admixture ranging from sand-clay and soft shale to Portland cement or fine granular material. Next comes the gravel or stone followed by bituminous surface-treated road. Among the high type surfaces (series K 187) are the various bituminous and concrete roads, such as the Bituminous Penetration which is at least an inch of gravel, stone or sand bound with bituminous material, or the Portland cement concrete road.

**K 189-191b. Federal-aid highway improvements, 1917-1945.** SOURCE: Same as for series K 177-181, except for series K 189. Data for series K 189 are from the various annual reports and records of the Public Roads Administration.

As early as 1893, the Federal Government demonstrated its interest in highway development by establishing in that year the Office of Road Inquiry which was the predecessor of the present Public Roads Administration. This Office was established with the view of initiating experiments and conducting inquiries concerning the best methods of road building, and it also encouraged the establishment by the States of active highway departments. In 1916, Congress passed the first Federal-aid highway act, whereby financial assistance to the States was provided as an encouragement to the development of adequate standards in road construction.

*Total miles* (series K 189) refers to existing mileage of the Federal-aid primary system only. *Cost data* (series K 191, 191a, 191b) represent actual expenditures of funds, the total being equal to federal funds plus State funds. Cost data are existing mileage figures only for the period prior to 1932; beginning in 1933, data on expenditures include money spent on public works and defense highways as well as on primary system.

**K 192.** This series has been omitted.

**K 193-204. State highway finances, 1914-1945,** except debt outstanding which begins in 1890. SOURCE: Same as for series K 177-181.

One of the first records of State highway revenues and expenditures was compiled by the U. S. Office of Public Roads in 1904. Subsequent reports were compiled by that Office in 1909 and 1914, and annually beginning with the year 1915.

*State property taxes and other revenues used for highway purposes* (series K 193) includes: Road, bridge and ferry tolls; property or road tax levies; appropriations from general funds; other State imposts; funds transferred from local governments; receipts from issue of bonds, notes, etc. for construction, etc.; earnings of sinking fund or debt reserve; and miscellaneous receipts.

A State highway-user tax (series K 195) is defined as a special tax or fee levied upon motor-vehicle users because of their use of the highways. Highway-user taxes include motor-fuel taxes, motor-vehicle registration and associated fees, and special taxes applicable only to motor carriers; these taxes are separable and apart from property, excise, business, or other taxes paid by the general public.

In many States, specific portions of the revenue from each type of highway-user tax are dedicated to particular highway purposes. A number of States, however, place all highway-user revenues in a highway fund, and a few have a general State fund into which go all types of revenue. For the latter group of States, each particular

appropriation or expenditure for highway purposes is considered to have been made from motor-fuel taxes, motor-vehicle registration fees and motor-carrier taxes in proportion to the relative amount of revenue received from each of these three sources.

The receipts from State highway-user taxes are not all expended on State highways. Series K 195-198 gives the allocation of these revenues according to the system on which they are ultimately expended. The receipts allocated to State highway purposes, series K 196, are eventually disbursed for State highway purposes, series K 199.

**K 205-214. County and local rural roads, funds contributed, and disbursed, 1921-1945.** SOURCE: Federal Works Agency, Public Roads Administration records, table HF-1, 2, and local-rural-road finance statistics.

**K 215-224. Funds contributed and disbursed for city and village streets, 1921-1945.** SOURCE: Federal Works Agency, Public Roads Administration records, table HF-1, 2, 21; DF; SF-6; except series K 218, which is from "Municipal Bond Sales" published by *The Bond Buyer*.

#### MOTOR VEHICLES AND FUEL (K 225-238)

**K 225-228. Motor vehicle production, 1900-1945.** SOURCE: Automobile Manufacturers Associations, *Automobile Facts and Figures*, 27th edition, 1946-1947, Detroit, Mich., p. 10. These data represent factory sales and wholesale value and include sales of military vehicles. Prior to 1940 station wagons, ambulances, funeral cars, and some school buses built on passenger car chassis are included with motor trucks. In 1940 and later years such vehicles built on passenger car chassis are included with passenger cars but the number of units involved was relatively small. Value figures for passenger cars shown for 1943 and 1944 are approximations based on the average value per unit in 1942. Actual values of passenger car factory sales are not available for 1943-1944. While production of passenger cars was temporarily discontinued in February 1942, some vehicles remained in factory stocks to be sold under rationing orders in 1942-1945.

**K 229-232. Motor vehicle registration, 1900-1945.** SOURCE: Same as for series K 177-181. These figures are based on reports and records of State motor-vehicle registration departments.

Data concerning motor vehicles in the early years of the century are incomplete, largely because few States required their registration, and hence had no records of the number of vehicles using roads and streets. As production of vehicles increased, shortly before the first World War, so did the number of registration laws; and by 1921 all States had adopted some form of motor vehicle registration.

Accompanying the growth in motor-vehicle registrations has been a corresponding diversity in the registration practices among the States. In general, motor vehicles are classified as private passenger cars, passenger carriers for hire, trucks, trailers, motor-cycles, and property carriers for hire. Several States, however, still register busses with either trucks or passenger cars. These differences have made it necessary for the Public Roads Administration to supplement the data submitted by the States with information obtained from special studies and from other sources.

**K 233-235. Motor fuel usage, 1919-1945.** SOURCE: Same as for series K 177-181. These figures include all motor fuel consumed. Nonhighway consumption includes all use off the highway, such as aviation, agriculture, marine, industrial, etc., and usually falls under the exemption or refund provisions of the motor-fuel tax law.

**K 236-238. Estimate of travel by motor vehicles, 1921-1945.** SOURCE: For 1921-1935, data were obtained from records of Federal Works Agency, Public Roads Administration, table VM-1 and table entitled "Estimates of Vehicle-Miles Traveled, 1921 to 1946"; for 1935-1945, see source cited for series K 177-181, p. 34.

**Air Transport: Series K 239-273**

**K 239-273. General note.** Only scattered data on air transportation are available for the years preceding 1926. The first federal government organization exclusively concerned with civil aviation matters, the Aeronautics Branch of the Department of Commerce, was organized under the Air Commerce Act of 1926. New facilities were established for examination and licensing of aircraft and airmen, for the enforcement of air traffic rules and for the collection and dissemination of aeronautical information.

Other activities were assigned to existing bureaus of the Commerce Department such as the Coast and Geodetic Survey, Bureau of Standards, and Bureau of Lighthouses. An Assistant Secretary of Commerce was provided in the Act to direct this work. Later, he appointed a Director of Aeronautics, and in 1934 the Bureau of Air Commerce was organized.

The Civil Aeronautics Act of 1938 created the successor, Civil Aeronautics Authority. It was to function independently of any existing department of government. This Authority consisted of an Administrator, and a quasi-judicial board of five members all appointed by the President. The function of this body was to grant airmen certificates, regulate mail and passenger rates, write air regulations, and formulate policies for civil aviation development. At the same time, there was created the Air Safety Board, a separate and independent body.

This Civil Aeronautics Authority inherited the personnel and duties of the Bureau of Air Commerce, and certain duties of the Post Office Department and the Interstate Commerce Commission, to all of whom the Air Mail Carriers had been responsible under the Black-McKellar Act of 1934.

In the summer of 1940, the Civil Aeronautics Authority underwent two reorganizations to attain its present form (1948).

Actually, the Authority now exists only on paper. It is more accurate to refer to its two main parts, the Civil Aeronautics Administration, which is part of the Department of Commerce, and the Civil Aeronautics Board, consisting of a 5-man panel, in itself a separate and independent organization.

The Civil Aeronautics Board prescribes Civil Air Regulations which deal with competency of airmen, airworthiness of aircraft and air traffic control. This board also issues certificates permitting persons to engage in air transportation as a business and fixes air mail rates and may establish maximum and minimum rates for transportation of passengers and goods. It also has the duty of investigating accidents in air transportation.

In addition to these rule-making and investigative functions, the Board acts as "judge" in prosecutions brought by the Administrator of Civil Aeronautics in connection with the revocation and suspension of airmen and air carrier certificates as a result of violations of the Civil Air Regulations.

The Civil Aeronautics Administration operates six main services: Federal Airways, Airports, Safety Regulation, Office of Aviation Information, Staff Program Office, and Aviation Training, in addition to the Washington National Airport and the Aeronautical Center at Oklahoma City, Okla.

All the data shown here, with some minor exceptions, appear in the Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948, Washington, D. C. (in press). Data on many other phases of civil aviation may be found in this *Handbook*.

**AIRCRAFT PRODUCTION AND EXPORT (K 239-245)**

**K 239-242. Aircraft production, 1913-1945.** SOURCE: Department of Commerce, Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948, Wash., D. C. Primary sources are as follows: For 1913-1925, see Department of Commerce, Aeronautics Branch, *Air Commerce Bulletin*, vol. 1, No. 5, p. 6. For 1926-1939, civil aircraft production data for odd years are from records of the Bureau of the Census and Civil Aeronautics

Administration records. All other data are from records of the Civil Aeronautics Administration, furnished by various agencies, public and private, or as compiled by that Administration from a variety of sources.

**K 243-245. Aircraft exports, 1913-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of data are the records of the Bureau of the Census and the Bureau of Foreign and Domestic Commerce.

**DOMESTIC SCHEDULED AIR TRANSPORTATION (K 246-256)**

**K 246-247. Domestic airline operators and aircraft in service in domestic scheduled air transportation, 1926-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948.

In noting the number of aircraft in service, it should be remembered that the data do not reflect the rise in average number of seats per plane. Between 1932 (first year that average available seats per plane were reported) and 1944, there was a 63 percent rise in total available seating capacity of domestic airlines despite a drop of 39 percent in the number of planes in operation. This was the result of the sharp increase in average available seats per plane from 6.58 to 17.53.

**K 248. Route mileage of domestic scheduled air transportation, 1930-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of data are as follows: For 1930-1937, data are computations of unduplicated route mileages prepared by the Civil Aeronautics Administration; for 1938-1945, see Civil Aeronautics Board, *Annual Airline Statistics, Domestic Carriers*. The CAB figures contain some duplication where two air carriers operate parallel routes.

**K 249. Average passenger revenue per passenger-mile for domestic scheduled air transportation, 1926-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of data are as follows: For 1926-1937, data were computed from Air Carriers' reports to CAA and predecessors; for 1938-1945, data were computed from CAB, *Annual Airline Statistics, Domestic Carriers*.

**K 250. Number of persons employed on domestic scheduled air transportation, 1928-1945.** SOURCES: Same as for series K 249.

**K 251. Revenue miles flown by domestic scheduled air transports, 1926-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of data are as follows: For 1926-1937, Air Carrier reports to Bureau of Air Commerce; for 1938-1945, see CAB, *Annual Airline Statistics, Domestic Carriers*.

**K 252-253. Revenue passengers carried by domestic scheduled air transports, 1926-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948.

**K 254. Revenue passenger-miles flown by domestic scheduled air transports, 1930-1945.** SOURCES: Same as for K 249.

**K 255. Express and freight ton-miles flown by domestic scheduled air transport.** SOURCES: Same as for series K 249.

**K 256. Mail ton-miles flown by domestic scheduled air transports, 1931-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of the data are as follows: For 1931-1937, see Post Office Department, *Annual Report of the Postmaster General*, 1942; for 1938-1945, see text for series K 249. The CAB figures include weights of containers; while the Post Office Department figures include only actual mail weights.

**OTHER AIR TRANSPORT STATISTICS (K 257-273)**

**K 257-258. Airports and landing fields, 1927-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. These data include military and CAA fields and exclude seaplane facilities.

In October 1940, Congress authorized the first appropriation under a Defense Landing Areas Program. More than 500 airports were constructed during the following six years under this program. This and other defense-stimulated construction accounts in large part for the fact that while the net total of airports remained virtually stationary at approximately 2,300 from 1934 to 1940, there was a jump to approximately 4,000 between 1941 and 1945.

**K 259-263. Total civil aircraft and certificated airplane pilots, 1927-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. Primary sources of the data are the CAA records for pilots and aircraft.

In 1939, the Civil Aeronautics Administration undertook a program of federally subsidized civilian pilot training. This program in large part accounted for the rise from 20,832 private pilots in 1939 to 93,782 in 1941 (see series K 263). During World War II, this program continued as an adjunct to the military pilot training activities, and gave preliminary training to hundreds of thousands of men who went into the military services. As a result of an arrangement whereby CAA certificated pilots on the basis of their military experience, a large number of these men appear in the 1945 figure for commercial pilots (series K 262).

**K 264. Miles flown in civil flying other than scheduled air carrier, 1926-1942.** SOURCE: Same as series K 259-263. Data were compiled from *Aircraft Owners' Semiannual Navigation Reports and Periodic Endorsement*. These data include business flying, executive travel in company-owned planes, flying done by the farmer in bringing perishable produce to market, personal business as well as vacation flying by the private owner, and commercial flying; in short, all flying operations except flying done by scheduled airlines.

**K 265-273. Accidents, 1927-1945.** SOURCE: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1948. For data prior to 1930, see *Handbook*, published December 1945. An *aircraft accident* is defined as an occurrence which takes place while an aircraft is being operated as such, as a result of which a person or persons are injured or killed or the aircraft receives appreciable or marked damage because of failure of the aircraft structure or engine or through the forces of external contact, or through fire. An aircraft is considered as "being operated as such" from the time the pilot or passengers board the aircraft with the intention of flight until such time as the pilot and passengers disembark from the aircraft upon completion of flight. A collision of two or more aircraft is reported statistically as one accident.

Data for non-air-carrier operations include business flying, executive travel in company-owned planes, flying done by the farmer in bringing perishable produce to market, personal business as well as vacation flying by the private owner, and commercial flying such as aerial photography and mapping, crop dusting, airport sightseeing, etc.

Prior to World War II, many of the types of flying operations above referred to as "non-air-carrier" flying operations were identified as "non-scheduled air-carrier" operations. After the war, however, the latter term tended to be confusing in that it was also used to identify a group more specifically labelled "non-certificated irregular air carriers." As a result, the term "non-scheduled air-carrier" has been dropped by the CAA and in its place, "non-air-carrier" has been substituted, as defined in the preceding paragraph.

Includes proprietary.

<sup>1</sup> Increase in investment over a period of years cannot be obtained accurately by subtraction of 1 year's investment from that of another owing to reorganization, sale, or abandonment reclassification, etc.

<sup>2</sup> Includes depreciation on "Miscellaneous physical property," for years prior to 1920. Amortization of defense projects included subsequent to 1940.

<sup>3</sup> The figures subsequent to the year 1914 include actually outstanding, nominally issued, and nominally outstanding securities in order that they may be comparable with those of previous years in which these items were not segregated. Funded debt unamatured does not include equipment obligations subsequent to 1942, but they are included herein to preserve the comparability of the figures.

<sup>4</sup> For 1921 to 1924, includes investment of lessor companies; and for 1925 to 1945, investment of lessor and proprietary companies; however, excludes investment of proprietary companies which are a part of systems filing consolidated annual reports.

<sup>5</sup> Classes I and II railways and their lessor subsidiaries.

<sup>6</sup> Class I railway.

<sup>7</sup> Investment for 1910 originally published is increased by \$170,000,000, estimated reserve for accrued depreciation, to make figures comparable with those of other years.

<sup>8</sup> Represents 1893 investments less increases each year on account of change in classification in 1893.

Series K 71-81.—RAILROADS—INCOME AND EXPENSES, AND INTEREST AND DIVIDENDS:  
1890 TO 1945

[ Includes intercorporate duplications. Unless otherwise noted, figures cover railways of classes I, II, and III, subject to general exception, that beginning with 1903 the returns for switching and terminal companies are excluded, while before that year they were included where applicable ]

YEAR	INCOME AND EXPENSES									INTEREST AND DIVIDENDS

<sup>1</sup> See headnote for series K 71-81.

<sup>2</sup> Data cover passengers on trains and travelers not on trains.

<sup>3</sup> Casualties sustained in nontrain accidents included with "Other persons." Nontrain accidents are those not caused directly by operation or movement of trains, locomotives, or cars, but attributable to shop machinery or use of tools and apparatus that result in reportable casualties.

<sup>4</sup> Prior to 1921 casualties sustained by employees not on duty in nontrain accidents included with "Other persons."

<sup>5</sup> Trespassers included with "Other persons" prior to 1922.

<sup>6</sup> Classes I and II railways.

Series K 94-104.—DOCUMENTED MERCHANT VESSELS—COMPOSITION OF THE MERCHANT MARINE: 1789 TO 1945

Gross tonnage of documented vessels of 5 tons net or more. Figures in boldface represent changes from those shown in source; see table 2 in text for series K 94-131

<sup>1</sup> Data as of Dec. 31 for 1789 through 1834; as of Sept. 30 for 1835 through 1842; as of June 30 for 1843 through 1940; as of Jan. 1, 1941 through 1945.  
<sup>2</sup> Includes canal boats and barges prior to 1868.

<sup>3</sup> Includes iron, steel, composite, and concrete.

<sup>4</sup> Data not available.

<sup>5</sup> Duty tonnage. Figures for 1789 are for 5 months only, Aug. 1 to Dec. 31.

Series K 105-118.—DOCUMENTED MERCHANT VESSELS—CHANGES IN THE MERCHANT MARINE: 1813 TO 1944

[ Gross tonnage of documented vessels of 5 net tons or more. Prior to 1877, tonnage figures are incomplete and table is out of balance in other respects; see text. Figures in boldface represent changes from those in the source; see table 2 in text for series K 94-131 ]

<sup>1</sup> Figures are for 12 months ending Dec. 31 for 1813 through 1834, ending Sept. 30 for 1835 through 1842, ending June 30 for 1843 through 1940 (June 30), ending Dec. 31 for 1940 (Dec. 31) through 1944, except for years where terminal dates change as follows: For 1835 and 1843, figures are for 9 months; for the two 1940 dates, figures in series K 105 for 1940 (Dec. 31) are for 6 months only, but figures for series K 107 and K 113-118 are for 12 months and overlap the 1940 (June 30) figures for those series.

<sup>2</sup> Does not agree with series K 120 for 1867, 1865, 1863, 1859, 1853, and 1815-1839, see text.

<sup>3</sup> Included in "all other" (series K 112 and K 113) prior to 1900.

<sup>4</sup> Beginning in 1933, figures represent tonnage of vessels removed from documentation, not total decrease, since figures for series K 117 are not available.

<sup>5</sup> Not available.

<sup>6</sup> Included in "all other" (series K 113).

<sup>7</sup> Exemption of canal boats. However, see text, general note for series K 94-131.

<sup>8</sup> *Annual Report of the Commissioner of Navigation, 1910*, p. 225, states that these figures (except that for 1862) represent "corrections made by striking from the balance of outstanding tonnage such vessels as have been sold to foreigners, lost, and condemned in previous years, not heretofore reported to this office by the collectors." The 1862 figure is stated as the result of "no returns of tonnage being received from the rebel districts." This agrees with "the balance sheets of tonnage" in the annual reports for the specific years.

<sup>9</sup> Included in figure for 1836.

Series K 119-123.—SHIPBUILDING—MERCHANT VESSELS BUILT IN UNITED STATES AND DOCUMENTED: 1797 TO 1944

Gross tonnage of documented vessels of 5 net tons or more. Figures in boldface represent changes from those shown in source; see table 2 in text for series K 94-131

						1797 ..	371	32,583	1,140	31,443	78,622

<sup>1</sup> Figures are for 12 months ending Dec. 31 for 1813 through 1834, ending Sept. 30 for 1835 through 1842, ending June 30 for 1843 through 1940 (June 30), ending Dec. 31 for 1940 (Dec. 31) through 1944, except for years where terminal dates change as follows: For 1835 and 1843, figures are for 9 months; for both 1940 dates, figures are for 12 months, hence figures for 1940 (Dec. 31) overlap the 1940 (June 30) figures.

<sup>2</sup> Does not agree with series K 107 for 1867, 1865, 1863, 1859, 1858, and 1815-1839, see text.  
<sup>3</sup> Includes canal boats and barges prior to 1868.  
<sup>4</sup> No record found for 1802.

Series K 124-126.—DOCUMENTED MERCHANT VESSELS—COMPOSITION OF MERCHANT FLEET  
BY GEOGRAPHIC REGION: 1816 TO 1945

[ Gross tonnage of documented vessels of 5 net tons or more. Figures in boldface represent changes from those shown in source; see table 2 in text for series K 94-131 ]

1866	232,738	121,335	105,329	6,124	103,358							

<sup>1</sup> Time periods covered same as for series K 120.

<sup>2</sup> Figures for these years add to series K 107, except 1828, 1830, 1835 and 1843.

<sup>3</sup> New England States included in series K 131 (The Coast).

<sup>4</sup> Figures are 12-month approximations for charting purposes.

<sup>5</sup> Figures for 1823 add to series K 120; those for 1830 add to neither series K 107 or K 120.

**Series K 132-145.—WATERBORNE COMMERCE OF THE UNITED STATES—SUMMARY OF  
CARGO TONNAGE: 1924 TO 1945**

[In thousands of short tons of 2,000 pounds. For definition of cargo tonnage, see text. Net totals are derived by deducting two types of duplications from unadjusted totals: (1) Traffic between seaports and river points, and (2) "Other duplications," comprising principally coastwise and lake traffic passing through canals and connecting channels other than the St. Marys Falls Canal and the Detroit River]

<sup>1</sup> Estimated from figures in this table on assumption that all deductions represent duplications in domestic traffic. There are, however, some minor duplications in figures for foreign traffic.

<sup>2</sup> Includes figures for harbor traffic of New York, Philadelphia, and San Francisco; local traffic of other seaports, and local traffic of lake ports.

<sup>3</sup> Excludes St. Marys Falls Canal traffic and additional Detroit River traffic both of which are already counted in Great Lakes traffic; also excludes duplications relating to rivers and canals themselves.

<sup>1</sup> Includes county roads under State control.

<sup>2</sup> Includes roads in forests, parks, etc.

<sup>3</sup> Includes State highway extensions within cities.

<sup>4</sup> For figures back to 1904, see series K 175.

<sup>5</sup> Beginning in 1937, includes special construction defined as mileage built by State Highway Departments on county and local roads not under State control, on city streets other than urban extensions of State highway system, on forest, park, and institutional roads, etc.

**Series K 205-214.—PUBLIC ROAD FINANCES—COUNTY AND LOCAL RURAL ROADS, FUNDS CONTRIBUTED AND DISBURSED: 1921 TO 1945**

[In millions of dollars. County and local data are for varying fiscal years as reported by individual States. Includes State disbursements for county and local rural roads]

1929	6,193	779	5,414	91,051	348	5,485	9,125								

<sup>1</sup> Value of aircraft, engines, parts, parachutes, etc.  
<sup>2</sup> 1913-1918, fiscal years. 1919-1945, calendar years. Data for the second half of 1918 are included with calendar year 1919.  
<sup>3</sup> Exclusive of gliders and barrage balloons.  
<sup>4</sup> Total value of aircraft, engines, parts, etc. 1913-1921 include values of aircraft and aircraft parts. Prior to 1922 engine values were not reported separately but were probably included with either "other" internal combustion engines or with "parts" of aircraft. Values for parachutes and their parts have been included only since 1932.  
<sup>5</sup> Includes U. S. financed aircraft manufactured in Canada.  
<sup>6</sup> Includes military aircraft for Lend-Lease shipments.  
<sup>7</sup> Values are for military aircraft produced in the United States only. These data were computed by the War Production Board in terms of August 1943 unit cost. The values are not meant to measure output at current prices or expenditures. The 1940 figure is only for the second half of that year; the 1945 figure covers only the first 8 months.  
<sup>8</sup> No production other than military.  
<sup>9</sup> Not available.

Series K 246-256.—AIR TRANSPORT—SCHEDULED AIR TRANSPORTATION, DOMESTIC ONLY: 1926 TO 1945

[ All data reflect scheduled operations exclusively ]

<sup>1</sup> Duplication exists where (a) the same passengers were carried on more than one route of an air carrier; and (b) where the same passengers were carried by more than one air carrier.  
<sup>2</sup> Duplication has been eliminated where the same passengers were carried on more than one route of an air carrier, but still exists where the same passengers were carried by more than one air carrier.  
<sup>3</sup> Based on revised CAB procedures.  
<sup>4</sup> Excludes Marine.  
<sup>5</sup> Excludes Colonial and Marine.  
<sup>6</sup> Figures for 1930-1936 include nonrevenue passenger-miles flown.  
<sup>7</sup> Figures for 1926-1934 include nonrevenue passengers.  
<sup>8</sup> Excludes Colonial Airlines, Inc., and Hawaiian Airlines, Ltd.  
<sup>9</sup> Excludes 224,236 ton-miles flown by U. S. Army.  
<sup>10</sup> Excludes Colonial Airlines, Inc.  
<sup>11</sup> Not available.  
<sup>12</sup> Includes employees of Pan American Airways.

Series K 257-264.—AIR TRANSPORT—AIRPORTS, AIRCRAFT, PILOTS, AND MILES FLOWN:

1926	(4)	(4)			(3)	(4)	(4)	18,746,640

<sup>1</sup> The count of certificated pilots after 1941 is not directly comparable with the previous years as the Civil Aeronautics Regulations were amended to permit pilot certificates currently effective on April 1, 1942, to continue in effect indefinitely. This amendment expires on July 1, 1947.

<sup>2</sup> Not available. No surveys made during war years, because the Civil Air Regulations were amended and aircraft owners were not required to submit reports.

<sup>3</sup> Airline transport rating became effective May 5, 1932.

<sup>4</sup> Not available.

<sup>1</sup> Includes scheduled revenue operators only.

<sup>2</sup> Rates computed on basis of total passengers carried and passenger miles flown (revenue and nonrevenue).

<sup>3</sup> No operational statistics for nonscheduled and personal flying are available for 1943, 1944, and 1945.

## Chapter L. Price Indexes (Series L 1-52)

The term *price*, as currently used (1947), is defined in terms of a definite physical specification of a commodity at specified terms of trade to a specified type of purchaser. In general, quotations used for indexes are transaction prices and exclude insofar as possible factors such as changes in grade or quality or terms of sale or in the proportion of goods sold to different classes of purchasers which affect average prices.

Price comparisons from one period to another which are based on inadequate commodity specifications may be invalid. Unfortunately most of the earlier investigations in the field of prices lacked detailed commodity descriptions. Thus we find such quotations as "wheat, \$1.00 per bushel," whereas a more complete commodity description might read "wheat, No. 2 red winter, bulk, carlots, f.o.b. Chicago, spot market price, average of high and low, per bushel."

The price of a commodity necessarily must refer to a specific point in time. Thus the Bureau of Labor Statistics' present monthly wholesale prices (1947) ordinarily are an average of 1-day-a-week prices and annual prices are averages of monthly prices; whereas retail prices are mid-month prices.

The term *price relative* is applied to a single price series, usually representing narrowly defined specifications, and relates the price for a given period to the price at some other fixed period as 100. A *price index* is a device for measuring average price changes for several commodities as a group with reference to a base period as 100.

### General Price Index: Series L 1

**L 1. General price index, 1791-1938.** Base: 1913 = 100. SOURCES: For 1791-1932, see *The Review of Economic Statistics*, Harvard Economic Society, Inc., vol. XVI, No. 2, February 15, 1934, p. 25. For 1933-1938, see Federal Reserve Bank of New York, *Monthly Review of Credit and Business Conditions*. For discussion see Tucker, Rufus S., "Gold and the General Price Level," *The Review of Economic Statistics*, vol. XVI, No. 1, January 15, 1934, p. 8.

The general price index of Carl Snyder, 1860-1932 (see *Business Cycles and Business Measurements*, New York, 1927), was extended backward in time to 1791 by Rufus S. Tucker. Snyder's index was first presented in 1924 in an article, "A New Index of the General Price Level from 1875," published in the quarterly *Journal of the American Statistical Association*, June 1924. It was based on wholesale prices, cost of living, and rents, computed by the Bureau of Labor Statistics; and wages, computed by the Federal Reserve Bank of New York. In 1928, the Snyder index was revised back to 1913. Revised indexes and the method of computation were described in "The Measure of the General Price Level" by Carl Snyder in *The Review of Economic Statistics*, Harvard Economic Society, Inc., vol. X, No. 1, February 1928, pp. 40-52. Until the end of 1939 when its calculation was discontinued, the Snyder index was published regularly in the *Monthly Review of Credit and Business Conditions*, cited above.

The index of the general price level is designed to measure average prices of exchanges of goods, services, and property. It is obtained by combining available series into a broad composite to represent the general level of all kinds of prices. The original index was based on commodity prices at wholesale, wages, cost of living, and rents with weights of 20, 35, 35, and 10, respectively. The revised index includes 12 component series with weights determined empirically, as follows:

Component series	Weight
1. Industrial commodity prices at wholesale.....	10
2. Farm prices at the farm.....	10
3. Retail food prices.....	10
4. Rents.....	5
5. Other cost of living items.....	10
6. Transportation cost.....	5
7. Realty values.....	10
8. Security prices.....	10
9. Equipment and machinery prices.....	10
10. Hardware prices.....	3
11. Automobile prices.....	2
12. Composite wages.....	15

### Wholesale Price Indexes: Series L 2-35

**L 2-35. General note.** Available wholesale price indexes shown in this chapter fall into 3 categories: The official wholesale price index of the Bureau of Labor Statistics, 1801 to date (series L 15), and indexes for 10 major product groups, 1890 to date (series L 16-25); Warren and Pearson's extension of the Bureau of Labor Statistics' indexes back to varying years in the 18th century (series L 2 and L 4-14); and other indexes independent of the BLS series (series L 3, L 26-35). A number of other wholesale price indexes not included in this volume have been computed. Some of these are discussed in United States Bureau of Labor Statistics Bulletin No. 284, *Index Numbers of Wholesale Prices in the United States and Foreign Countries*, together with techniques of calculation. They include series computed by *Bradstreet's* beginning in 1890 on about 96 commodities; by *Dun's Review* beginning in January 1901 on about 300 quotations and gradually carried back to 1860; by Thomas Gibson beginning 1910 on 22 foods; by the *New York Times Annalist* in 1913 on 25 foods; and by the Federal Reserve Board in 1918 on the basis of BLS data. Both *Dun's* and *Bradstreet's* series were sums of actual prices rather than index numbers.

In 1935 a weighted index of general wholesale commodity prices, 1815-1845, was computed by Walter B. Smith and Arthur H. Cole on the basis of 35 commodities and published in *Fluctuations in American Business, 1790-1860*, Harvard Economic Study No. 50, Harvard University Press, table 45, p. 158. During 1929-1938 a comprehensive historical investigation of commodity prices was made under the auspices of the International Scientific Committee on Price History and the results published in *Wholesale Commodity Prices in the United States, 1700-1861*, by Arthur H. Cole, Harvard University Press, 1938.

As used here, the term *wholesale* does not refer to transactions between intermediate distributors and retailers. As currently used for price indexes (1947) the term *wholesale* refers to primary markets or those in which the first major commercial transaction occurs for a specified commodity or stage of production of a commodity. Thus wholesale prices in the Bureau of Labor Statistics' index are generally those charged by representative manufacturers, producers, or importers to distributors or industrial users of particular commodities, or are those prevailing on commodity exchanges.

**L 2. Wholesale price index of all commodities, 1749-1932.** Base: 1910-1914 = 100. SOURCE: Warren, George F., and Pearson, Frank A., *Prices*, New York, 1933, table 1, pp. 11-13. (Data shown here are reprinted by permission of the publishers, John Wiley and Sons, Inc.) See also Cornell University Agricultural Experiment Station, *Wholesale Prices for 213 Years, 1720-1932*, Memoir 142, 1932, part 1, pp. 7-10; and Bureau of Labor Statistics, Bulletin No. 572, *Wholesale Prices, 1931, 1933*, appendix, pp. 111-114. The latter shows the index on the base 1926 = 100.

Warren and Pearson used the Bureau of Labor Statistics' index (series L 15) for 1890-1932, but converted it to a 1910-1914 base and extended it back to 1797. From 1797, the index was extended back to 1720 by Dr. Herman Stoker. Prices collected relate almost entirely to New York City. For 1797 to 1890 they were obtained directly or indirectly from newspapers, chiefly the *New York Price Current*, 1796-1817, and the *New York Shipping and Commercial List*, 1815 to the Civil War, supplemented by the data published in the *Report of the Secretary of the Treasury on the State of the Finances* for the year ending June 30, 1863. Price series were obtained for 110 to more than 140 commodities.

The all-commodities index based on these series, which the authors felt most representative of price changes in the 19th century prior to 1890, was constructed with varying weights for the commodity groups (series L 4-14). The weights were adjusted gradually by making one-ninetieth of the total change between 1799 and 1889 in January of each year. Weights were assigned each commodity within the groups, according to their importance in the total trade of the country. Because of the meager data available, assignment of such weights was necessarily largely arbitrary. The number of commodities in each group, except hides and leather and possibly housefurnishings, was considered sufficient to give reliable group indexes.

Price data were scarce and irregular prior to 1749. As a result, prior to 1749, the index was computed only for certain months in each year, and annual index numbers for the period 1720-1748 are not shown.

For the period 1787-1800 Stoker constructed his "71-commodity index" using the same group indexes and essentially the same methods as used by Warren and Pearson in their calculations back to 1797, but with somewhat different group weights. Stoker's indexes were linked to the Warren and Pearson indexes by a 3-year overlap, 1798-1800.

For the period 1720-1787 Stoker constructed his "15-commodity index," based on 11-19 series, chiefly foods, using arbitrary weights. This was linked to his "71-commodity index" by a 14-month overlap, November 1786 through 1787. No group indexes were possible.

**L 3. Wholesale price index of 30 basic commodities, 1798-1932.** Base: 1910-1914=100. SOURCE: Warren, George F., and Pearson, Frank A., *Prices*, New York, 1933, table 4, p. 30. (Data shown here are reprinted by permission of the publishers, John Wiley and Sons, Inc.) To provide a more sensitive index of prices, Warren and Pearson constructed a special index of 30 basic commodities. Almost the same list of commodities and weights was used for the entire period. Prior to 1890, the index was derived by Warren and Pearson using the same prices as in their all-commodity index (see above for series L 2); subsequent to 1890, using prices collected by the Bureau of Labor Statistics. This index includes prices of farm products, minerals, textiles, and like products relatively flexible in price.

**L 4-14. Wholesale price indexes of 11 major product groups, 1786-1932.** Base: 1910-1914=100. SOURCE: Warren, George F., and Pearson, Frank A., *Prices*, New York, 1933, table 3, pp. 25-27. (Data shown here are reprinted by permission of the publishers, John Wiley and Sons, Inc.) For an alternative source, see Cornell University Agricultural Experiment Station, *Wholesale Prices for 213 Years, 1720-1932*, Memoir 142, 1932, part 1, tables 34-45, pp. 84-111. Product groups shown represent the 10 major groups used by the Bureau of Labor Statistics for the computation of its wholesale price index of all commodities. Warren and Pearson added an eleventh group, "Spirits," for the period 1787-1889. Commodities in each group were weighted in accordance with their importance at the time. Also, see text for series L 2, above, for identification of indexes in different periods.

**L 15. Wholesale price index of all commodities, 1801-1945.** Base: 1926=100. SOURCE: Department of Labor, Bureau of Labor Statistics. For 1801-1941, see *Handbook of Labor Statistics*, 1941

edition, vol. I, p. 715; for 1942-1945, see *Monthly Labor Review* and semiannual or annual report, *Wholesale Prices*.

**Original sources.**—The official weighted index of wholesale prices currently computed by BLS for all commodities dates from 1890, but it has been extended back to 1801 on the basis of other series. Price indexes from 1801-1840 were computed from historical data collected by Alvin H. Hansen and published in *Wholesale Prices for the United States, 1801-1840*, in *Publications of the American Statistical Association*, December 1915, pp. 804-812, and in Bureau of Labor Statistics, *Bulletin No. 367, Wholesale Prices, 1890-1923*, Appendix F, pp. 235-248. Actual prices for individual commodities on which Hansen's index is based, together with price relatives, also are shown in *Bulletin No. 367*. Indexes from 1841-1889 were taken from data collected for the Subcommittee on Tariff, Committee on Finance of the United States Senate, under the chairmanship of Senator Nelson W. Aldrich, and published in a comprehensive report issued March 3, 1893, *Wholesale Prices, Wages, and Transportation*, Senate Report No. 1394, 52d Congress, 2d Session, part I, p. 9. This report, called the *Aldrich Report*, was issued in response to a resolution, passed two years earlier, authorizing the Committee to investigate the effects of the tariff laws "upon the imports and exports, the growth, development, production, and prices of agricultural and manufactured articles, at home and abroad." Much of the data for this report was assembled for the committee by the Commissioner of Labor.

In 1900 the Aldrich index was carried forward 8 years by Roland P. Falkner by a different method of calculation and published by the Department of Labor, *Bulletin No. 27, Wholesale Prices: 1890 to 1899*. In 1902, the Department of Labor began the publication of its own wholesale price index "in order to meet the constant and growing demand for statistics of prices." The index has been continued without interruption since that time.

**Coverage.**—The present (1947) wholesale price index of the Bureau of Labor Statistics is designed to measure average changes in commodity prices in primary markets in the United States. It is derived from a selection of commodities, specifications, markets, and reporters chosen to represent the total of all primary markets and important segments of such markets. At present (1947) about 860 different commodity series are included in the index. It excludes transactions for services, banking and insurance, stock market trading, transportation, construction, real estate sales, and rents. Separate indexes have been computed monthly for all commodities and 10 major groups, beginning in 1890. In addition, indexes are available for 49 subgroups and 5 economic groups, beginning in 1913.

Prices used are transaction quotations, collected by mail from individual producer-reporters or from trade journals, usually for 1-day-a-week, and averaged to obtain a monthly price.

During the course of years, a number of changes in coverage and method of computation of the index have been made, and in some cases indexes have been recomputed for earlier years. The

TABLE 1.—NUMBER OF PRICE SERIES AND WEIGHTING FACTORS USED IN BLS WHOLESALE PRICE INDEX (ALL COMMODITIES): 1890 TO 1945

YEAR	Number <sup>1</sup>	Weights used
1940 to 1945.....	881-890	} Quantities marketed 1929-31
1938 to 1939.....	813

1917 to 1920.....	327-328	
1914 to 1916.....	296-300	} Quantities marketed 1909
1890 to 1913.....	251-261	
		Equal weights <sup>2</sup>

<sup>1</sup> Number of price series included in index.

<sup>2</sup> With the number of relatives representing roughly the importance of individual commodities.

number of series has increased from 251 in 1890 representing 99 commodities to about 890 in 1945 and the quantity weighting factors have been revised six times. The number of price series and weighting factors used in the index since 1890 are shown in table 1.

**Methods.**—The current (1947) index is of the fixed-base weighted aggregative type which was adopted in 1937. Weights represent quantities marketed in 1929 and 1931. The quantity weight for each commodity is multiplied by the current price to obtain a cross-product. The cross-products for individual commodities are totaled to obtain value aggregates for groups and sub-groups. The group indexes are then calculated by dividing these current-period aggregates by base-period aggregates, in effect obtained by multiplying the price in the base period by the quantity weight.

From 1890 to 1906 the BLS index was a simple arithmetic mean of price relatives. From 1907 to 1936 the index was computed by the chain method, basing changes from one period to the next only upon those commodities for which data were available during both periods. Individual commodities were not explicitly weighted until 1914.

Indexes from 1841-1889 are arithmetic averages of unweighted relative prices from the Aldrich report, converted to a 1926 base. Prices represented actual transaction prices as of a single date in each year, usually January 1, obtained from careful investigation of the books of merchants and manufacturers. Prices were tabulated for 223 commodities from 1860 to 1891 and for 90 commodities in earlier years. This list of commodities did not adequately represent all commodities dealt in at wholesale. Thus, out of the 223 articles, 53 were foods and 54 metals, including 25 series on pocket knives.

Indexes for all commodities from 1801-1840 were arithmetic averages of unweighted relative prices as reported by Alvin H. Hansen, converted to a 1926 base. Each distinct commodity was given equal weight. Indexes from 1801-1825 were constructed from monthly quotations for 79 commodities as near to the first of the month as possible, as published in the *Boston Gazette* for the years 1801 to 1815 and in the *Boston Patriot* for the years 1816 to 1825. Indexes from 1825 to 1840 were based on monthly prices for 63 commodities at New York as published in the *Report of the Secretary of the Treasury on the State of the Finances* for the year ending June 30, 1863. When a range of prices was shown, the arithmetic mean of prices was used. According to Hansen, "it is doubtful to what extent the articles for the two cities are identical" and "the vagueness of descriptions also raises some questions as to the continuity of the information as between the series and as within the two series. Further, the standards prevailing at so remote a period must affect any comparison with present-day prices." See Bureau of Labor Statistics, *Bulletin No. 367*, Appendix F, p. 235.

**L 16-25. Wholesale price indexes of 10 major product groups, 1890-1945.** Base: 1926=100. SOURCE: See above for series L 15. These indexes measure the average change in commodity prices at primary market levels. Wherever feasible, prices used are f.o.b., point of production or sale. In the case of farm products and some foods, prices quoted in organized commodity markets are used. Indexes are based on a smaller number of commodities for earlier years. In January 1940, the group *Chemicals and allied products* was substituted for the group *Chemicals and drugs*. The revision was made by years from 1926. The indexes for the two groups are not strictly comparable but may be used for all practical purposes.

**L 26-27. Wholesale price indexes of farm products: Unweighted, 1840-1891; weighted, 1840-1891.** Base: 1860=100. SOURCE: Senate Report 1394 (Aldrich Report), *Wholesale Prices, Wages, and Transportation*, Hon. Nelson W. Aldrich, United States Senate Committee on Finance, March 3, 1893, part I, tables 33, 35, pp. 107, 109. See text for series L 15 concerning "Aldrich Report."

Indexes were based on 63 individual price series, combined into

15 distinct commodities. Prices were collected by the Department of Agriculture in 3 cities, (New York, Cincinnati, and Chicago), from records of commercial organizations such as the Produce Exchange of New York, and from newspapers and merchants' account books. The accuracy of the results was limited by changes in classification and the chaotic nature of earlier records. General indexes were computed from 1840 to 1891, giving equal weight to each of the 15 products (series L 26), and also from 1860 to 1891, giving weights proportional to their production in the 3 census years, 1860, 1870, and 1880 (series L 27).

**L 28-35. Wholesale price indexes of 8 major product groups, 1840-1891.** Base: 1860=100. SOURCE: *Aldrich Report* (see text for series L 26-27), table 22, p. 91. Indexes for 8 major groups in the *Aldrich Report* were calculated in the same way as the all-commodity index (see text for series L 15), giving equal weight to each commodity.

Because of the objections to the technique of equal weighting, special indexes of all commodities and of food and clothing were calculated for the *Aldrich Report* giving varying weights according to family consumption in 1891 as determined in a consumer expenditure study conducted by the Department of Labor. These are included on pages 9 and 94 of part I of that Report.

### Cost of Living, Consumers' Price, and Retail Price Indexes: Series L 36-52

**L 36-52. General note.** The concept of the cost of living and its measurement has been the subject of much controversy and investigation in recent years. To many people the term *cost of living* has meant the total cost in dollars of a family budget. Change in the cost of a fixed standard of living sometimes has been confused with the cost of a changed standard of living. *Cost of living* indexes generally measure the former rather than the latter, changes in prices for a fixed list of living essentials rather than the actual level of living costs. This subject is discussed thoroughly in the *Report of the President's Committee on the Cost of Living*, Office of Economic Stabilization, 1945. Following this report both the Bureau of Labor Statistics and the National Industrial Conference Board changed the name of their indexes from "Cost of living" "to Consumers' prices."

*Retail prices* collected for the BLS index are midmonth prices. They represent *average* prices paid by consumers in retail stores, as determined for most articles by personal visits of Bureau of Labor Statistics representatives. Prices are obtained for goods most nearly meeting definite specifications. However, there are constant changes in the nature and quality of goods available, particularly in clothing. When an article priced for the index is not available, the most nearly comparable article is priced.

**L 36. Federal Reserve Bank of New York's cost of living index, 1820-1913.** Base: 1913=100. SOURCE: Federal Reserve Bank of New York, *Index of Estimated Cost of Living in the United States* (1938 revision, mimeographed). See also general note for series L 36-52.

The Federal Reserve Bank's index of the estimated cost of living in the United States was obtained by linking together several indexes. From 1820 to 1859 indexes were those of A. H. Hansen as published in the *American Economic Review*, March 1925, p. 32, using those of R. P. Falkner from 1840 to 1859. These are also included in Hansen's long-term index from 1820-1923 (see series L 37). Indexes from 1860 to 1879 were those of W. C. Mitchell in *Gold Prices and Wages Under the Greenback Standard*, pp. 86-87; from 1880-1889 those of W. R. Burgess in *Trends of School Costs*, p. 54, shown here as a separate series from 1841 to 1920 (series L 38). Indexes from 1890 to 1909 were those of Paul H. Douglas as published in the *American Economic Review*, Supplement, March 1926, p. 22. Those from 1910 to 1912 were obtained by correlating the BLS index beginning 1913 with the cost of living index computed for the State of Massachusetts by the Department of Labor

and Industries of the Commonwealth of Massachusetts, Division on the Necessaries of Life, and published regularly in its *Annual Report*.

**L 37. Hansen's cost of living index, 1820-1923.** Base: 1913=100. SOURCE: Hansen, Alvin H., "Factors Affecting the Trend of Real Wages," *American Economic Review*, March 1925, p. 32. See also general note for series L 36-52.

Hansen's index of the estimated cost of living was obtained by linking together these indexes: For 1820-1840, an index of wholesale prices of food, coal, candles, and clothing weighted according to expenditures of 232 families in 1891, as reported in Senate Report 1394 (Aldrich Report), *Wholesale Prices, Wages, and Transportation*, part I, p. 62; for 1840-1890, Falkner's weighted index of wholesale prices as shown in the Aldrich Report, part I; for 1890-1912, the Bureau of Labor Statistics index of retail food prices (see series L 48); and for 1913-1923, the Bureau of Labor Statistics index of consumers' prices (see series L 41).

**L 38. Burgess' cost of living index, 1841-1920.** Base: 1913=100. SOURCE: Harvard Economic Society, Inc., *The Review of Economic Statistics*, February 1934, vol. XVI, No. 2, p. 26. See also Burgess, W. Randolph, *Trends of School Costs*, Russell Sage Foundation, New York City, 1920, p. 54, for original data in dollars. See also general note for series L 36-52.

Burgess' series, titled "Cost of Living Per Week for Small Family Using the Same Amounts of the Same Commodities Over the Entire Period," represents the total weekly cost for a small family, in dollars and cents, of food, clothing, shelter, and incidentals. It is based upon the prices of 10 staple articles of food appropriately weighted. These foods constituted the bulk of family food purchases as shown by the BLS 1901-1902 expenditure study. The weekly food cost was multiplied by a factor which would raise food costs to the total weekly budget of a typical wage earner's family (man, wife, and two children) in 1901.

**L 39. Douglas' cost of living index, 1890-1926.** Base: 1890-1899=100. SOURCE: Douglas, Paul H., *Real Wages in the United States, 1890-1926*, Houghton Mifflin Co., Boston and New York, 1930, p. 60. See also general note for series L 36-52.

Douglas' "Most Probable Index of the Movement of the Total Cost of Living for Workingmen" was constructed for early years on the basis of Bureau of Labor Statistics retail prices for food and wholesale prices for clothing, fuel and light, furniture, tobacco, and spirits. The retail food index was adjusted to include a larger number of commodities, using BLS wholesale prices, adjusted by the variation of the retail from the wholesale index for as many identical commodities as possible. Wholesale prices of other groups were adjusted to represent retail prices using the same adjustment factor as for foods. A combined index for all groups was computed, weighted according to relative importance as shown by the BLS consumer expenditures study of 1901-1902. For later years the BLS cost-of-living index was used; but in years when BLS data were available only semiannually, monthly indexes were estimated by interpolation.

**L 40. National Industrial Conference Board consumers' price index, 1914-1945.** Base: 1923=100. SOURCE: National Industrial Conference Board, *The Economic Almanac for 1946-47*, "Cost of Living of Wage Earners in the United States, 1914-1946," New York, p. 276. This index was known as the NICB "Cost of living index" prior to October 1946. See also general note for series L 36-52.

In purpose and in general statistical techniques, this index is similar to the Bureau of Labor Statistics index (see series L 41). The 1934-1936 family expenditure study conducted by the Bureau of Labor Statistics also is the basis of the selection and weighting of individual commodities priced. Prior to June 1941, the NICB used the BLS food cost index in preparing its all-items index but thereafter it compiled its own food index.

This index currently (1947) is based on information collected in about 60 cities as compared with 34 or 56 cities used for the BLS

index. It includes a number of small cities not in the BLS sample. Indexes for 50 to 60 cities are available beginning January 1939. Prices of about 240 individual items are collected by mail questionnaire instead of personal interview. Rent data are collected periodically from real estate agents, banks, chambers of commerce, and real estate boards instead of from tenants as for the BLS index. Quotations conform to general rather than detailed physical specifications.

Indexes were computed for July of each year 1914-1917; June and November of 1918; and March, July, and November of 1919. Comprehensive investigations were continued at 4-month intervals but beginning January 1920 and through 1945 monthly estimates were computed for intervening months on the basis of a smaller sample.

**L 41-47. Bureau of Labor Statistics consumers' price indexes for moderate income families in large cities, 1913-1945.** Base: 1935-1939=100. SOURCE: Department of Labor, Bureau of Labor Statistics. For 1913-1940, see Bulletin No. 699, *Changes in Cost of Living in Large Cities in the United States, 1913-41*, 1941, p. 44; for 1941-1945, see *Monthly Labor Review*, April 1947, p. 707. See also general note for series L 36-52.

The index is a price barometer, not a measure of changes in the total amount families spend for living, which is affected by changes in income and manner of living. Thus, income taxes are excluded.

This index represents the movement in the prices of living essentials in the family budget: Food, clothing, housefurnishings, rent, utilities, fuels, and miscellaneous goods and services such as medical care, personal care, transportation, laundry services, and recreation. The present index (1947) is based on about 180 individual items, as well as rent, including 61 foods, 39 articles of clothing, 12 kinds of fuel, 21 kinds of housefurnishings, 48 miscellaneous goods and services. For many articles two or more qualities are priced for the index. Excluding foods, about 400 different kinds and qualities of goods are priced for the index. Commodities were selected to represent all articles purchased by typical families, on the basis of a detailed study made by the Bureau in 1934-1936 of actual expenditures of about 14,500 moderate-income families. Beginning in 1930, indexes were calculated for each city. Weights for individual items in the index for each city from 1930 to date were assigned in accordance with their importance in the family budget in each city as indicated by the 1934-1936 study, giving each article a weight equivalent to all commodities which it represents.

The index is based currently (1947) upon changes in food prices in 56 cities and changes in prices of other goods and services in 34 cities. More than 120,000 food prices are collected each month in 1,750 independent food stores and 275 chain organizations, representing about 8,600 individual stores. Prices for other goods and services are obtained from 3,900 stores or service establishments. Stores are carefully selected to represent those customarily patronized by moderate-income families. Rents are obtained from tenants in 40,000 dwellings in 34 cities.

Specifications for commodities priced are described in detail and wherever possible prices are obtained for identical articles of the same quality from time to time. For all articles except coal, gas and electricity, prices are collected from retailers by personal visits of BLS representatives who usually examine merchandise. Prices for coal, gas, and electricity are obtained by mail questionnaire, supplemented by occasional personal visits.

Prices collected are those actually charged consumers. Prices used in the index represent the average price for each article in all stores visited in each city.

The index is of the fixed base weighted aggregative type on the base 1935-1939=100. Group indexes are computed for each city on the basis of relative importance of expenditures of families in that city. Indexes for the United States (average of 34 large cities) are computed by assigning weights to each city based on the popu-

lation of the metropolitan area of the city and of other cities in the same region and size class.

This index was originated as part of a general investigation of the cost of living in 92 shipbuilding or other industrial centers conducted by the Department of Labor for the years 1918-1919, as reported in Bureau of Labor Statistics Bulletin No. 357, *Cost of Living in the United States*. As part of this study prices were secured in a number of cities for December of each year 1914-1917, inclusive, and in other cities for December 1917 only. The index has since been computed at varying intervals (annually, semi-annually, or quarterly) and currently (1947) is computed and published monthly in mimeographed releases and in the *Monthly Labor Review*.

A number of changes in coverage and methodology have been made since these indexes were first issued in 1919 with index numbers back to 1913 for 19 cities and back to 1917 for 13 additional cities. Two more cities later were added to the index with data back to 1935. Improved methods of calculation were introduced in 1935 as described in "Revision of Index of Cost of Goods Purchased by Wage Earners and Lower-Salaried Workers," by Faith M. Williams, Margaret H. Hogg, and Ewan Clague, in *Monthly Labor Review*, September 1935, pp. 819-837.

The original cost of living index was weighted according to consumption of wage earners and clerical workers in 1917-1919 by geographic areas rather than individual cities, as shown by the consumer expenditures study of the Department of Labor. A major revision in the method of calculation was made in 1939 together with a general revision of the weighting factors and revised indexes computed back to 1935. This revision is described in detail in Reprint R-1156, *The Bureau of Labor Statistics' New Index of Cost of Living*, from the August 1940 issue of the *Monthly Labor Review*. The new index included a considerably larger number of items than the earlier indexes, and the base period of the index was changed to 1935-1939 as recommended by the (Federal) Central Statistical Board (now the Division of Statistical Standards), Bureau of the Budget.

From March 1935 to December 1939, indexes were computed using both weighting factors. Since differences in the movements of the two indexes were not large, a link between old indexes prior to 1935 and the current series seemed reasonable. From 1930 to 1940, 1934-1936 expenditure weights were used; from 1913 to 1925, 1917-1919 expenditure weights; and for intervening years, an average of the two. The 19 city indexes available from 1914 through 1917 were combined without population weights. Indexes from 1918 through 1935 were combined with weights representing average population in 1920-1930, those from 1935 through 1942 using 1930 census data. Census data for 1940 were used for combining cities beginning in 1943.

During the war the index only partially showed the effects of such factors as lowered quality, disappearance of low-priced goods, forced changes in housing, and eating away from home. The President's Committee on the Cost of Living (see general note for series L 36-52) estimated in November 1944 that the index understated the rise in retail prices between January 1941 and September 1944 by a maximum of 3 to 4 points, and that if small cities were included in the national average, another half point would be added. In December 1945, the Stabilization Administrator, Office of War Mobilization and Reconversion, indicated that if account were taken of continued deterioration of quality and unavailability of merchandise between September 1944 and September 1945, the over-all allowance for the period January 1941 to September 1945 would total about 5 points for large and small cities combined.

**L 48. Index of retail cost of food (unrevised), 1890-1934.** Base: 1913=100. SOURCE: Department of Labor, Bureau of Labor Sta-

tistics, Bulletin No. 635, *Retail Prices of Food, 1923-1936*, appendix, part IV, p. 200.

The BLS index of retail-food costs back to 1890, as originally computed, has been carried only through 1934. In 1935 a major revision was made in the computation of this index and indexes revised back to 1913. The revised indexes are included in the tabulation of consumers' prices, 1913-1945 (see series L 42). For the years 1890-1907 prices of 30 staple articles were collected. From 1908-1912, only 15 foods were included in the food index; from 1913 to 1920, 22 articles; and from 1921 to 1934, 43 articles. Original indexes represent a weighted average of price relatives for foods included. Weighting factors for earlier years represent average expenditures by urban wage-earner families in 5 geographic divisions as determined by the family expenditure study for 1901-1902. Weighting factors for later years according to geographic area were based on the family expenditure study for 1918-1919.

**L 49. Index of net price of manufactured gas, 1907-1934.** Base: April 1913=100. SOURCE: Department of Labor, Bureau of Labor Statistics. For 1907 to 1923, see BLS *Bulletin No. 495*, table 18, p. 208. For 1929 to 1934, see BLS monthly publication, *Retail Prices*, for June 1929 to November 1934.

The Bureau of Labor Statistics indexes of retail prices of manufactured gas, "Relative Net Price Per 1,000 Cubic Feet of Specified Months of Each Year, 1907 to 1934," represent simple averages of net prices for household use for specified months based upon an average family consumption of 3,000 cubic feet of manufactured gas. Rates were obtained by correspondence from utility companies in 51 cities included in the United States composite. Increased use of natural gas and other changes necessitated a change in 1935 in the method of computing average prices, using constant heat units (therms) regardless of variations in kinds or heating value of gas used. Indexes on the new basis are available back to 1923. For history of the collection and publication of retail prices of gas, see Bureau of Labor Statistics, *Bulletin No. 628*, pp. 48-52.

**L 50. Index of retail prices of bituminous coal, 1913-1945.** Base: October 1922-September 1925=100. SOURCE: Department of Labor, Bureau of Labor Statistics. For data prior to 1929, data are from unpublished records; for 1929-1945, see *Monthly Labor Review*, July 1946, p. 116.

These indexes were computed semiannually, January 1913-January 1920; monthly, February 1920-July 1935; quarterly, September 1935-September 1940; and monthly, October 1940-December 1945. From 1939 to 1945, the indexes are based on an unweighted arithmetic average of over 600 quotations from 31 to 38 cities; for earlier years, a varying number of cities and quotations was used. The index numbers have been adjusted for changes in the sample.

**L 51. Index of average retail prices of anthracite (chestnut), 1913-1945.** Base: October 1922-September 1925=100. SOURCE: See above for series L 50.

Prior to 1929, these indexes are based on an unweighted average of quotations from a varying number of cities. From 1929 to 1945, they are based on weighted average retail prices in 18 to 25 cities. Weighting factors are described in BLS Bulletin R-465, *Retail Prices*, October 1936. The series have been adjusted for changes in the composition of the sample. Indexes were computed semi-annually from January 1913-January 1920; monthly, from February 1920-July 1935, quarterly from September 1935-September 1940; and monthly from October 1940-December 1945.

**L 52. Index of rents in 5 large cities, 1860-1880.** Base: 1860=100. SOURCE: Warren, George F., and Frank A. Pearson, *Prices*, New York, 1933, table 52, p. 267. (Data shown here are reprinted by permission of the publishers, John Wiley and Sons, Inc.)

## Chapter M. Balance of Payments and Foreign Trade (Series M 1-112)

### International Balance of Payments: Series M 1-41

The international accounts of the United States comprise the international balance of payments and the international investment position of the United States. The balance of payments shows for given time periods, e.g., one year, the transfers of assets and the form of compensation for these transfers between this country and the rest of the world; the international investment position indicates for specific dates the value of U. S. investments abroad and of foreign investments in the United States. The two types of accounts, however, are not strictly comparable; the transfers of assets between countries as shown in the balance of payments is only one of the factors affecting the value of foreign investments. Other factors, not shown in the balance of payments are changes in security values and revaluation of assets, and reinvested earnings and losses.

**M 1-13. International investment position of the United States, 1843-1945 (selected years).** SOURCE: For 1843-1914 and portions of the data for 1919, 1924, and 1929, see Lewis, Cleona, *America's Stake in International Investments*, The Brookings Institution, Washington, D. C., 1938. Other data are estimates of the International Economics Division, Office of Business Economics, Department of Commerce. Published sources where available are as follows (all Department of Commerce): For 1919 and 1930, see *The United States in the World Economy*, Economic Series No. 23, 1943, p. 123; for 1927, data represent partial revisions of previously published data; for 1931, see *Balance of International Payments of the United States in 1931*, Trade Information Bulletin No. 803, 1932, pp. 44, 48, 62; for 1935, see *Foreign Investments in the United States*, 1937, p. 5; for 1940 and 1945, see *International Transactions of the United States During the War, 1940-45*, Economic Series No. 65, 1948, p. 110. In the Brookings data, wherever possible, direct investments are based on book value; while portfolio investments are calculated at par value for bonds and preferred stock, and at market value for common stock. Similar practices were followed in the estimates of the Department of Commerce for 1930, 1931, and 1935; and miscellaneous portfolio investments were calculated at market values wherever possible. For 1940 and 1945 bonds and preferred stock were calculated at market values. These series consist of estimates which have been prepared by compilers who used different valuation methods and whose data varied in completeness. While the estimates are therefore not homogeneous, they do present rough indications of the magnitudes involved.

**M 14-41. International transactions of the United States, 1850-1945.** SOURCES: For 1850-1918, see Bullock, C. J., Williams, J. H., and Tucker, R. S., "The Balance of Trade of the United States," *The Review of Economic Statistics*, July 1919, pp. 215-266; for 1919-1944, see Department of Commerce, *International Transactions of the United States During the War, 1940-45* Economic Series No. 65, 1948, table 1, p. VIII, and table XXVI, pp. 221-222; for 1945, see *Survey of Current Business*, June 1948, p. 8. Data for the years 1919-1939 represent rearrangements of estimates published in Department of Commerce, *The United States in the World Economy*, Economic Series No. 23, 1943. Methods of estimating the component series are described briefly in the appendixes to *The United States in the World Economy*, and in more detail in *International Transactions of the United States During the War, 1940-45*.

The data from 1821-1849 shown in table 1, and the data for the years 1850-1918 shown in series M 14-41, are published in Bullock, Williams, and Tucker, mentioned above. These data for the period

prior to 1914 are admittedly far less satisfactory than the data for the later period because, with the possible exception of merchandise trade, very few data are available for this early period to provide a basis for estimating international transactions.

TABLE 1.—INTERNATIONAL TRANSACTIONS: 1821 TO 1849  
[ In millions of dollars ]

ITEM	1821-1837		1838-1849	
	Credit	Debit	Credit	Debit

Sale of ships.....	8.0		6.2	
Immigrants.....	11.0		75.0	15.0
Tourists.....		11.0		84.5
Mexican War and indemnity.....				25.0

The balance-of-payments statement in series M 14-41 reflects all the exchanges of goods, services, gold, and capital claims between the United States and all other areas of the world. For periods prior to 1940, the figures include data for continental United States, Alaska, Hawaii, and Puerto Rico. Since 1940, data for the Virgin Islands, the Panama Canal Zone, and American Samoa are also included.

Transactions are divided into four categories—goods and services, unilateral transfers, long-term capital movements, and gold and short-term capital movements. The statement is built on a double-entry system, whereby every transaction is recorded both as a debit and a credit. The rules for distinguishing debits and credits are the same as for double-entry bookkeeping: Debits represent increases in assets or decreases in liabilities, and credits represent decreases in assets or increases in liabilities. Thus an export of merchandise in return for a check drawn on a foreign bank account in this country results in a credit for the export (a reduction in an asset) and a debit for the reduction in foreign bank deposits (a reduction in a liability). Unilateral transfers to foreign countries (payments, series M 28) are debits (as are expense items in accounting), and unilateral transfers from foreign countries (receipts, series M 19) are credits (as are income items in accounting). While it is true that all transactions have a debit and credit phase, both sides are not estimated simultaneously or from the same sources; hence the possibility of error and the resulting residual or "errors and omissions" item (series M 41) which has been given the plus or minus sign necessary to make the account balance for each of the years and periods shown.

The Department of Commerce began its series in 1922, later extending the data backward to cover the years 1919-1921. Continued changes and improvements in the methods of collecting data have occurred and the figures have become progressively more reliable over time. An attempt has been made to make the data comparable over the entire period by including the same kind of transactions under each category with the exception of the treatment of gold (see text for M 37-40). In particular, beginning about the middle 1930's, a much greater reliance was placed on direct questionnaires than had been the case in earlier years. The method of estimating individual items described below is, in general, descriptive only of recent years.

**M 14 and M 23. Total receipts and total payments, 1850-1945.** SOURCE: See text for series M 14-41. Series M 14 comprises the

summation of figures in series M 15, M 19-20. Series M 23 comprises the summation of series M 24, M 28-29.

**M 15 and M 24. Total goods and services, 1850-1945. SOURCE:** See text for series M 14-41. Here are included all exports or imports of movable goods and so-called invisible items, or services. The latter include shipping, travel, property income (interest, dividends, and profits), and other miscellaneous service to the extent as estimates have been attempted. For the later years such estimates include insurance transactions, expenditures of foreign governments in the United States, management fees, motion picture and other royalties, and various smaller items. Exports are credits (or receipts) since in each case the country is giving up an asset; contrariwise, imports (or payments) are debits because the country is acquiring an asset.

**M 16 and M 25. Goods, 1850-1945. SOURCE:** See text for series M 14-41. The basic data on merchandise trade are those published annually in *Foreign Commerce and Navigation of the United States*, Bureau of the Census. For the years after 1914 and particularly after 1919 to an increasing extent, adjustments have been made to correct for known overvaluation or undervaluation, to exclude noncommercial items, to include an estimate for smuggled goods and other nonrecorded trade, and to adjust for certain differences in territorial coverage, e. g., the inclusion of trade with the Panama Canal Zone in the original statistics. Since 1940 it has been possible to substitute to a large extent actual purchase data on Government-procured imports; also transfer figures based on fiscal records were used for lend-lease exports instead of the figures appearing in the recorded trade statistics. For the years after World War I and World War II, sales and other transfers of surplus property located abroad were added. Payments for merchandise, particularly during and after World War II, include also military purchases abroad which were not imported. Beginning in 1919, adjustment for the special treatment of gold has been made (see series M 37-40, below).

**M 17 and M 26. Income on investments, 1850-1945. SOURCE:** See text for series M 14-41. In earlier years these data represent particularly rough estimates based on estimates of the value of American investments abroad and foreign investments in the United States, and assumed over-all rates of return on such investments. Beginning about the middle 1930's, direct questionnaires were inaugurated in an attempt to get better data for this item. A questionnaire to American companies having foreign branches and subsidiaries was started in 1937. Interest on foreign dollar bonds was estimated on the basis of information available regarding individual issues beginning in 1931, supplemented in later years by estimates from various sources regarding the percentage of each issue held in the United States. Data received by the Bureau of Internal Revenue in connection with the withholding of tax on income paid to nonresident aliens on their investments in the United States have been extensively used particularly since 1936, when, for the first time, dividends were subjected to the withholding tax.

**M 18 and M 27. Other services, 1850-1945. SOURCE:** See text for series M 14-41. This category includes freight and shipping, travel, and miscellaneous services. Freight receipts and payments have been based largely on recorded data showing the tonnage of exports and imports in American and foreign bottoms, respectively. These figures have been collected by the United States Maritime Commission and its predecessor agencies. With these tonnage data and information gathered from various sources regarding freight rates, estimates of shipping revenue were made. Expenditures of American vessels in foreign ports and of foreign vessels in American ports have been estimated on the basis of fixed percentages of total revenues earned; these percentages were arrived at largely on the basis of certain financial data furnished to the Maritime Commission by the subsidized American lines, together with other general information regarding the ratios of port expenditures to gross earnings. The account also includes a small estimate for earnings

of United States railroads hauling foreign goods in transit through the United States and of earnings and expenses of American railroads operating in Canada.

Travel estimates involved the use of data collected by the Immigration and Naturalization Service on the volume of international travel and sample data on average expenditures collected by the Department of Commerce through use of direct questionnaires to international travelers.

Data on other visible items have been collected from a wide variety of sources, including direct questionnaires to communications companies, insurance companies, and advertising firms. Expenditures of United States Government agencies abroad have been provided by such agencies.

**M 19 and M 28. Unilateral transfers, 1850-1945. SOURCE:** See text for series M 14-41. These are gifts, contributions, and other transfers of value not involving a *quid pro quo* in the form of goods, services, gold, or capital assets. The item includes not only cash gifts, such as immigrant remittances, but also the value of gifts in kind, such as UNRRA or lend-lease shipments. Thus unilateral transfer debits reflect the value of all gifts, contributions, and similar items to foreign countries, whether in cash or other capital claims, or in the form of goods or services. Information regarding Government unilateral transfers (lend-lease, UNRRA, aid to China, war settlements, etc.) has been obtained either from the Government agencies involved or from their official reports and other publications.

In earlier years personal remittances were estimated largely on the basis of information furnished to the Department of Commerce by American foreign service officers abroad regarding estimates of personal remittance receipts from the United States by persons living in the countries to which they were accredited. Beginning in the middle 1930's, American banks and other remitting agencies were requested to report directly to the Department of Commerce on this item.

In recent years institutional remittances have been based on direct questionnaires to various religious, educational, and charitable institutions remitting funds abroad, including the Red Cross and various war relief agencies.

**M 20-22 and M 29-31. Long-term capital movements, 1850-1945. SOURCE:** See text for series M 14-41. These data represent shifts in capital claims of indefinite maturity or of a maturity of more than one year. They refer not only to securities (stocks, bonds, mortgages, etc.) but also to real property (farms, branch factories, and real estate). Real property purchased by the government for its own use, however, has been included in services, while all expenditures of religious and charitable institutions are included in unilateral transfers, even if they involve the purchase of fixed assets. Investments of the United States abroad are assets; foreign investments in the United States are liabilities.

Long-term capital movements consist of: (1) New issues, amortizations, and transactions in outstanding securities. Information is received from direct questionnaires to brokers and other dealers in securities. Since 1935 these questionnaires have been under the jurisdiction of the Treasury Department which operates through the various Federal Reserve Banks. (2) Direct investments. Until 1937 movements of direct investment capital were estimated very roughly on the basis of published reports, newspaper clippings, and similar items, together with known or estimated changes of the total value of American direct investments abroad. Beginning in 1937 questionnaires have been received from a substantial number of American companies with large direct investments abroad showing annual movements on intercompany account and, beginning in the last half of 1945, changes in holdings of securities of subsidiaries. Practically no data are available on movements of foreign direct investment capital in the United States. (3) Government loans and investments. This information has been received from the Government agencies involved, such as the Treasury De-

partment, Export-Import Bank, and Reconstruction Finance Corporation.

**M 23-31. Payments, 1850-1945.** SOURCE: See text for series M 14-41. Series M 23 comprises the summation of series M 24, 28-29. The discussion of each of series M 23-31 is combined, above, with the text for each of the companion series M 14-22.

**M 32-36. Excess of receipts or payments, 1850-1945.** SOURCE: See text for series M 14-41. These series represent the difference between corresponding series of receipts and payments.

**M 37-40. Net inflow or outflow of funds on gold and short-term capital account, 1850-1945.** SOURCE: See text for series M 14-41, above. These data include all capital movements other than long-term (see text for series M 20-22 and M 29-31), that is, movements of bank deposits and other claims payable on demand or with an original maturity of less than 1 year. Until 1919 the gold entry in the balance of payments is the net international movement of gold in all its forms. Beginning in 1919, however, the gold entry is the net change in the monetary gold stock, including Stabilization Fund holdings. Thus, since 1919, the gold stock is considered a special kind of international asset, all increases in which are debited and decreases credited in the balance-of-payments statement. Gold may enter the balance-of-payments account either in the form of merchandise or in monetary form. If domestic production of gold exceeds domestic nonmonetary use, such excess is now treated as an export or credit and is shown as a plus (+) even if it enters the domestic monetary gold stock. If domestic consumption exceeds production, the excess is now treated as an import and is shown as a minus (-), and may be considered to be that part of the imported gold used as merchandise and not added to the monetary gold stock. The latter was the case in the years 1943-1945. The sum of the merchandise entry and the monetary gold entry, it should be noted, still equals net international gold transactions.

Short-term capital movements have been based for many years on information received directly from American banks regarding their liabilities to and claims on foreign countries. These figures are published regularly, along with securities transactions, in the *Federal Reserve Bulletin* and *Bulletin of the Treasury Department*. Particularly during World War II a large number of transactions by the United States Government fell in the short-term capital category. These included advance payments for the purchase of commodities, foreign currency, and deposits held by Government agencies, particularly the military, obligations incurred by the United States Government because of the use of "special" currencies by the armed forces, and other miscellaneous items.

The net international movement of gold has been based on the export-import data published by the Bureau of the Census and data on gold held in the United States under earmark for foreign account by the Federal Reserve Bank of New York. Beginning with the data for 1919, as already indicated, the net international movement of gold has been adjusted to allow for net domestic production over industrial consumption or vice versa. In making this adjustment it was considered that of the various series extant, those on production, international movements, and changes in monetary stock, were most accurate; domestic industrial consumption was then estimated as the residual element needed to bring the other items into balance. The equation is: Domestic production plus imports (or minus exports) minus domestic consumption equals change in monetary stock.

**M 41. Errors and omissions, 1850-1945.** SOURCE: See text for series M 14-41. As indicated in the text for series M 14-41, this is the residual item which has been given the sign (+ or -) necessary to make the account balance.

### Foreign Trade: Series M 42-112

**M 42-112. General note.** The sources of import, export, and in-transit statistics are the copies of the import entries and ware-

house withdrawals prepared by importers or their brokers, and of export declarations prepared by shippers, or their authorized agents or brokers.

Annual statistics on foreign trade appear in the report *Foreign Commerce and Navigation of the United States*, and monthly data appear in the *Monthly Summary of Foreign Commerce of the United States*. Except as noted, the values stated are in United States dollars without reference to changes in the gold content of the dollar. The geographic area covered by these statistics is the United States customs area, which includes Alaska, Hawaii, and Puerto Rico, and from January 1, 1935, through December 31, 1939, the Virgin Islands of the United States.

Beginning with 1790, annual statistical statements on the foreign commerce and navigation of the United States were compiled by the Treasury Department from reports submitted by the collectors of customs and transmitted to Congress by the Secretary of the Treasury. These annual statements for the years 1790 to 1820 have been brought together and published with other reports required by the Congress in two volumes of *American State Papers*.

In 1820, Congress established the Division of Commerce and Navigation in the office of the Register of the Treasury and required that collectors of customs compile and transmit annual reports to that office showing the detailed trade with foreign countries and the navigation employed therein. Beginning with 1821, these reports were consolidated and published annually in the volume, *Commerce and Navigation of the United States*.

In 1866, Congress established in the Treasury Department a Bureau of Statistics and specified that the kinds, quantities, and values of all articles exported and imported should be distinctly set forth in the statistical accounts, by countries of destination or of shipment, and that the exports of articles produced or manufactured in the United States should be shown separately from the reexports of foreign articles imported into the United States.

Prior to 1866, only annual statistics of the foreign commerce of the United States were compiled and published. Since then monthly statistics have been published.

In 1923, the function of compiling foreign trade statistics was transferred to the Department of Commerce; however, the release and publication of the annual figures had been done by that Department since 1903. In 1941 the function was transferred, within the Department of Commerce, from the Bureau of Foreign and Domestic Commerce to the Bureau of the Census.

Since the appearance of the *Statistical Abstract of the United States*, the historical time series on United States foreign trade have, in general, been presented in that publication as well as in the aforementioned primary sources. The *Abstract* is therefore cited here as a primary source for a large portion of the foreign trade data shown.

**M 42-44. Total merchandise, gold and silver exports and imports, combined, 1821-1945.** SOURCES: For 1821-1880, see Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*, 1912, pp. 43-44; for 1881-1903, see *Statistical Abstract*, 1924, tables 427-428, pp. 420-421; for 1904-1945, see *Statistical Abstract*, 1947, table 996, p. 891. For components, see text for series M 45-50 and M 51-55.

**M 45-50. Gold and silver exports and imports, 1821-1945.** SOURCES: For 1821-1864, see *Foreign Commerce and Navigation of the United States*, 1912, p. 43; for 1865-1880, see *Statistical Abstract*, 1887, pp. 41, 42; for 1881-1945, see sources for series M 42-44, above. The data shown here for 1821-1864 for series M 47 and for series M 50 are not shown in the source but have been derived as the residual of the exports and imports data as shown in the source. Prior to 1895, figures for gold and silver relate to coin and bullion only; subsequently they include ore also. Domestic exports of gold and silver cannot be separately stated prior to 1864, but it is probable that the greater portion of the exports

was gold. In the series shown here, the data on exports of gold prior to 1864 include domestic exports of silver. The exports of silver for years prior to 1864, therefore, consist of only foreign exports, or reexports.

**M 51-55. Merchandise, exports and imports, 1790-1945.** SOURCE: For 1790, see *Foreign Commerce and Navigation of the United States*, 1912, p. 43; for 1791-1880, see Treasury Department, Bureau of Statistics, *Monthly Summary of Imports and Exports of the United States for the Fiscal Year, 1896*, pp. 622-623; for 1881-1903, see *Statistical Abstract*, 1924, tables 427-428, pp. 420-421; for 1904-1945, see *Statistical Abstract*, 1947, tables 995-996, pp. 890-891.

Merchandise export statistics include data on all shipments of commodities and merchandise leaving the United States customs area except: (1) Gold and silver and evidences of debt; (2) in-transit merchandise; (3) bunker fuel, stores, supplies, and equipment for vessels and planes; (4) temporary exports; (5) merchandise having small value or no commercial value; (6) shipments of military and naval supplies and equipment to the armed forces of the United States; (7) shipments to United States Government agencies or establishments.

"Exports of United States merchandise" (M 52) consist of commodities grown, produced or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States.

"Reexports" (M 53) comprise withdrawals from customs bonded storage warehouses for exportation and exports of foreign merchandise (principally duty-free articles) which have previously been formally entered through customs. Exports of foreign merchandise consist of commodities of foreign origin which have entered the United States as imports and which, at the time of exportation, are in the same condition as when imported.

Merchandise import statistics include data on all commodities and merchandise reaching the United States except: (1) Merchandise not entering the United States customs area, such as articles excluded from the United States by law, bunker fuel, and ships' stores; (2) in-transit merchandise; (3) certain domestic merchandise returned from foreign countries; (4) gold, silver, and evidences of debt; (5) merchandise having small value or no commercial value; (6) commodities entered under special provisions, such as articles consigned to diplomatic officers. "General imports" (M 54) consist of entries for immediate consumption and entries into warehouses, and therefore comprise the total arrivals of merchandise, whether they enter consumption channels immediately or are entered into warehouses under customs custody to be subsequently withdrawn for consumption or withdrawn for exportation.

**M 56-67. Value of merchandise, exports and imports, by economic classes, 1821-1945.** SOURCE: For 1821-1881, see *Statistical Abstract*, 1907, table 266, pp. 698-701; for 1882-1903, see *Statistical Abstract*, 1926, table 477, pp. 448-449; for 1904-1945, see *Statistical Abstract*, 1947, table 1024, pp. 896-897. Export data are exports of United States merchandise and imports are "imports for consumption" from 1933-1945. Prior to 1933, figures are for "general imports." For definition of terms, see text for series M 51-55 and M 68-74.

The economic classes shown here are broad categories based on groupings of more than 2,000 individual commodities listed in *Schedule B: Statistical Classification of Domestic and Foreign Commerce Exported From the United States and Regulations Governing Statistical Returns of Exports of Commodities*, "Part II, Numerical Classification and Articles Included (January 1, 1945, edition)," issued and kept current by the Foreign Trade Division of the

Bureau of the Census. Following are some of the important and typical commodities included in each of the economic classes:

	Exports	Imports
Crude materials	Crude petroleum	Crude rubber
	Coal	Raw silk
	Raw cotton	Hides and skins
Crude foodstuffs	Grains	Coffee
	Fruits	Tea
	Vegetables	Fruits
Manufactured foodstuffs	Meat	Sugar
	Lard	Meat
	Prepared fruits	Butter and cheese
Semimanufactures	Iron and steel plates	Wood pulp
	Lumber	Copper in bars, etc.
	Refined copper	Tin in bars, etc.

**M 68-74. Value of merchandise imports and duties, 1821-1945.** SOURCES: For 1821-1880, see Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*, 1912, p. 50; for 1841-1915, see *Foreign Commerce and Navigation of the United States*, 1924, p. LXVII; for 1916-1943, see *Statistical Abstract*, 1947, table 1023, p. 927; for 1944-1945, data are from records of the Bureau of the Census. Imports are "imports for consumption" consisting of entries for immediate consumption and withdrawals from warehouses for consumption. The term "entry for consumption" is the technical name of the import entry made at the custom house, and implies that the goods have been delivered into the custody of the importer and that the duties have been paid on the dutiable portion. Some of them may be exported afterwards.

From 1821 to 1866, inclusive, the figures of import values (series M 68-70) represent net general imports (total imports less reexports), the amount of duty collected (calculated) being the annual amounts collected on merchandise only. For 1867 and later years, the figures of import values represent imports entered for consumption.

**M 71. Duties calculated.** The series described here as "duties calculated" is the series identified in annual volumes of *Foreign Commerce and Navigation* through the 1925 issue as "duties collected"; subsequent issues describe it as "duties calculated." In spite of its description, it was a computed figure at least back to 1876. The evidence indicates that the earlier years, at least in part, were on a "duties collected" basis. This series should not be confused with the modern series called "duties collected" (not shown here) which represents the total amount of duties actually collected (on individual shipments) as reported to the Treasury Department by Collectors of Customs, subject in certain cases to subsequent refund as well as drawback. In contrast, "duties calculated" is a statistical measure derived by applying the appropriate rates to totals for all imports of the given commodity received at all ports of entry; it does not reflect drawbacks or refunds and is subject to some time lag in reporting.

**M 72-73. Ratio of duties to total.** The calculated ratio of duties to total is simply the relationship of series M 71 to M 68 and M 70, respectively, expressed in percentage form. These series (M 72-73) are similar to, but not identical with, the series described as "ratios of duties to total" shown in annual issues of *Foreign Commerce and Navigation*, 1925 to the present, and as "average ad valorem rates" in earlier issues. These series have been computed as shown here because of conflicts in source volumes with respect to early years.

**M 75-86. Value of merchandise imports, free and dutiable, by economic classes, 1821-1945.** SOURCES: For 1821-1881, see *Statistical Abstract*, 1907, table 266, pp. 694-697; for 1882-1904, see *Statistical Abstract*, 1926, table 478, pp. 450-451; for 1905-1945, see *Statistical Abstract*, 1947, table 1024, pp. 928-929. Data are "general imports" through 1933; "imports for consumption" beginning

1934. For definitions of the two terms, see text for series M 51-55 and M 68-74. For the period 1922-1933, there is an understatement of the free goods and an overstatement of the dutiable goods in general imports as follows: For 1922-1933, carpet wool used for making carpets and, for 1922-1928, wheat imported for milling in bond for export, were reported as dutiable when entered although no duty was ultimately paid on these products. For explanation of economic classes, see text for series M 56-67.

**M 87-102. Value of merchandise exports and imports by destination and origin, 1821-1945.** SOURCES: For 1821-1880, see *Statistical Abstract of the United States*, 1946, table 1016, pp. 910-911; for 1882-1903, see *Statistical Abstract*, 1926, table 479, pp. 452-453; for 1904-1945, see *Statistical Abstract*, 1947, table 1014, pp. 910-911. The country of ultimate destination of the goods is shown as the destination; but when the final destination is not known to the exporter, the shipment is credited statistically to the country to which it is consigned. The Philippine Islands are included with Asia for all years; Turkey in Europe is with Asia beginning 1926; Soviet Republics in Asia are with Europe beginning 1924; and Hawaiian Islands are with Oceania prior to 1901. Northern North America includes Iceland beginning 1942; that nation was included with Europe prior to 1942.

**M 103-112. Value of merchandise exports and imports, by groups of customs districts, 1860-1945.** SOURCES: For 1860-1880, see *Statistical Abstract of the United States*, 1923, table 695, pp. 824-825; for 1881-1903, see *Statistical Abstract*, 1924, table 441, p. 441; for 1904-1945, see *Statistical Abstract*, 1947, table 1020, p. 921. Import data are "general imports" through 1933, and are "imports for consumption" thereafter. The Customs district in which merchandise is entered or withdrawn for consumption is the district shown in the "imports for consumption" statistics. The Customs district shown in the "general import" statistics is the district through which merchandise enters the United States either as an entry for immediate consumption or as an entry into a customs bonded warehouse. Except for shipments by mail the customs district through which a shipment clears when it leaves the country is the district to which the export is credited statistically. Exports are not credited on the basis of the district in which the shipments originate. Exports and imports by mail are credited to the customs district at which the import entry is filed. For definition of terms, see text for series M 51-55 and M 68-74. Export figures for 1865 and 1870-1878 represent mixed gold and currency values and hence do not agree with the specie values given for total exports elsewhere.

## Series M 1-13.—BALANCE OF PAYMENTS—INTERNATIONAL INVESTMENT POSITION OF THE UNITED STATES: 1843 TO 1945

<sup>1</sup> Unilateral transfers indicate the amount of contributions in kind or in cash thru lend-lease, U.N.R.R.A., personal and institutional remittances, and similar channels. Thus, payments or receipts under unilateral transfers in most cases offset exports or imports, respectively, of goods and services for which present or future compensation is not required.

<sup>2</sup> Figure for net long-term capital transactions for 1933 includes \$40,000,000, and that for 1934 includes \$30,000,000, representing net transfer of funds in security arbitrage operations. These transactions cannot be divided between domestic and foreign securities in these years.

**Series M 42-55.—FOREIGN TRADE—VALUE OF EXPORTS AND IMPORTS: 1790 TO 1945**

In thousands of dollars. Figures for 1945, and in some cases those for 1942-1944, are preliminary. For revised figures, see *Foreign Commerce and Navigation of the United States, 1945*, and *Statistical Abstract of the United States, 1943*

1805..	95,566	42,387	53,179	120,600	-25,034						

<sup>1</sup> Fiscal years ending Sept. 30, 1790-1842; June 30, 1843-1915; calendar years thereafter.  
<sup>2</sup> Prior to 1864 domestic exports of silver included with gold.  
<sup>3</sup> Figures include gold and silver prior to 1821.  
<sup>4</sup> Figures (in thousands of dollars) for 6-month period of July 1, 1915-Dec. 31, 1915, are as follows: Series M 42, 1,905,456; series M 43, 1,238,559; series M 44,

+666,897; series M 45, 23,843; series M 46, 307,030; series M 47, -283,187; series M 48, 28,750; series M 49, 13,742; series M 50, +10,003; series M 51, 1,852,863; series M 52, 1,820,393; series M 53, 32,470; series M 54, 912,787; and series M 55 +940,076.  
<sup>5</sup> Period beginning Oct. 1, 1842, and ending June 30, 1843.  
<sup>6</sup> Data shown under silver are for gold and silver.

BALANCE OF PAYMENTS AND FOREIGN TRADE

Series M 56-67.—FOREIGN TRADE—VALUE OF MERCHANDISE EXPORTS AND IMPORTS, BY ECONOMIC CLASSES: 1821 TO 1945

[In thousands of dollars. See headnote for series M 42-55, p. 243]

<sup>1</sup> Fiscal year ending Sept. 30. 1821-1840; June 30, 1850-1915; calendar years thereafter.

<sup>2</sup> Includes beverages.

<sup>3</sup> Import data are "general imports" through 1932, "imports for consumption" thereafter.

<sup>4</sup> Imports for consumption (in thousands of dollars) are as follows: Series M 62, 1,433,013; series M 63, 419,632; series M 64, 215,490; series M 65, 191,196; series M 66, 289,612; and series M 67, 317,083.

<sup>5</sup> Figures (in thousands of dollars) for 6-month period July 1, 1915-Dec. 31, 1915 are as follows: Series M 56, 1,820,393; series M 57, 303,223; series M 58, 157,897; series M 59, 292,720; series M 60, 268,002; series M 61, 798,546; series M 62, 912,787; series M 63, 378,446; series M 64, 130,398; series M 65, 113,441; series M 66, 143,752; and series M 67, 146,750.

<sup>6</sup> Excludes exports from San Francisco valued at \$1,343,064.

1848	140,652	14,946	125,706	33,034	23.49	26.28	1.51								

<sup>1</sup> Fiscal years ending Sept. 30, 1821 to 1842; June 30, 1843 to 1915; calendar years thereafter beginning in 1916.

<sup>2</sup> Based on estimated population of the U. S. including armed forces overseas.

<sup>3</sup> Figures for 6-month period July 1, 1915—Dec. 31, 1915, are as follows: series M 68, \$934,675,000; series M 69, \$631,334,000; series M 70, \$303,291,000; series M 71, \$95,853,000; series M 72, 10.26 percent; series M 73, 31.61 percent; and series M 74, \$0.95.

<sup>4</sup> During the period from May 1, 1900, to July 25, 1901, merchandise brought from Puerto Rico was dutiable at 15 percent of regular rates. The duties collected thereon were as follows: May 1, 1900, to June 30, 1900, \$134,593.88; July 1, 1900 to July 25, 1901, \$448,193.91.

<sup>5</sup> Period beginning Oct. 1, 1842, and ending June 30, 1843.

## Series M 75-86.—FOREIGN TRADE—VALUE OF MERCHANDISE IMPORTS, FREE AND DUTIABLE, BY ECONOMIC CLASSES: 1821 TO 1945

[In thousands of dollars. See headnote for series M 42-55, p. 243]

<sup>1</sup> Fiscal years ending Sept. 30, 1821-1840; June 30, 1850-1915; calendar years thereafter beginning in 1916.

<sup>2</sup> Includes beverages.

<sup>3</sup> Figures (in thousands of dollars) for 6-month period July 1-Dec. 31, 1915, are as follows: Series M 75, 623,837; series M 76, 233,950; series M 77, 332,105; series M 78, 46,340; series M 79, 113,550; series M 80, 16,849; series M 81, 20,082; series M 82, 93,359; series M 83, 103,717; series M 84, 40,035; series M 85, 59,333; series M 86, 87,367.

<sup>4</sup> Estimated value of free fish.

<sup>5</sup> Teas, coffee, and fruits transferred to free list in tariff of 1832.

Series M 87-102.—FOREIGN TRADE—VALUE OF MERCHANDISE EXPORTS AND IMPORTS BY DESTINATION AND ORIGIN: 1821 TO 1945

[In thousands of dollars. See headnote for series M 42-55, p. 243]

YEAR 1	EXPORTS (INCLUDING REEXPORTS)								GENERAL IMPORTS

<sup>1</sup> Fiscal years ending June 30, 1860-1915; calendar years thereafter beginning in 1916.<sup>2</sup> Figures (in thousands of dollars) for 6-month period July 1, 1915-Dec. 31, 1915,

are as follows: Series M 103, 1,303,340; series M 104, 633,241; series M 105, 223,556; series M 106, 44,396; series M 107, 9,766; series M 108, 13,024; series M 109, 97,319; series M 110, 105,067; series M 111, 213,331; and series M 112, 105,395.

## Chapter N. Banking and Finance (Series N 1-232)

### Banking Statistics: Series N 1-147

N 1-147. **General note.** "There are four principal events which may conveniently be taken as dividing American banking history into periods. The first was establishment in 1782 of the Bank of North America, the first bank in the United States. This occurred at the end of the Revolutionary War and a few years before the formation of a Federal Government under the Constitution.

"The second event was adoption in New York State of the Free Banking Act of 1838, a statute which profoundly influenced subsequent American banking practice, banking supervision, and the banking structure as a whole. Close to this event in time were the discontinuance in 1836 of the Bank of the United States as a Federal institution, the panic of 1837, the original establishment of the Independent Treasury System in 1840, and enactment of the Louisiana Banking Law of 1842.

"The third event was establishment of the national banking system in 1863. This coincided roughly with discontinuance of note issue by State banks, the shift from bank notes to bank deposits, the War between the States, and the beginning of a new phase of industrial and westward territorial expansion.

"The fourth event was establishment of the Federal Reserve System in 1913. The System's operations began in 1914, the year war broke out in Europe. The period from then to the present, 1940, has been crowded with developments whose course has not yet been concluded and whose significance cannot yet be appraised"—from "Historical Introduction" by Bray Hammond in *Banking Studies*, authored by Members of the Staff, Board of Governors of the Federal Reserve System, 1941.

Collection of banking and monetary statistics in the United States has been conditioned by the development of our banking and monetary system. Banks in this country have been in part under the jurisdiction of State governments, in part under the Federal Government and in part outside the jurisdiction of both governments. As a result, the collection of statistics for all classes of banks has never been completely centralized in one agency. National banks organized under the Federal law enacted in 1863 are supervised by the Comptroller of the Currency, and State-chartered banks are supervised by officials of the respective States. Another supervisory entity, the Federal Reserve System, was established in 1914 to exercise central banking functions, some of which are shared with the United States Treasury. The Reserve System includes all national banks and, in addition, such State banks as voluntarily join the System.

Prior to the National Banking Act of 1863, the only official collection of figures for the entire country was made by the Treasury Department under authority of a resolution of the House of Representatives passed in 1832. From 1832 to 1863, with the exception of some years, the Secretary of the Treasury included in his reports to Congress information regarding the number of State banks. From 1863 to 1873 statistics of national banks only were published—in the *Annual Report of the Comptroller of Currency*. Since 1864, the Comptroller of Currency, who has charge of the supervision of national banks, has collected condition reports from three to six times annually and has tabulated and published summaries of these reports, showing the principal assets and liabilities, that is, total loans, United States Government securities, other securities, reserves, bankers' balances, interbank deposits, other demand deposits, and time deposits. National bank data are published in detail in *Abstract of Reports of Condition National Banks* (usually 3 times a year). Until recently, the *Annual Report of the*

*Comptroller of Currency* contained many historical tables. For historical data see also *Publications of the National Monetary Commission*, vol. 7; for a statement concerning the inadequacy of the historical data for "all banks" see appendix A, pp. 243-60, of that volume.

After the Federal Reserve System was established in 1914, State bank members of the Federal Reserve System began to submit to the Federal Reserve banks their statements of condition at the same time and in substantially the same form as national banks. The data from these statements have been consolidated by the Federal Reserve Board with data for national banks collected by the Comptroller of the Currency into totals for all member banks of the Federal Reserve System, and are published in detail by the Board of Governors of the Federal Reserve System in the *Member Bank Call Report* (usually three times a year) and in summary form in the monthly *Federal Reserve Bulletin*.

The data shown here were compiled principally from the two basic sources in this field: *Annual Report of the Comptroller of the Currency*, and *Banking and Monetary Statistics*, a one-volume statistical summary published in 1943, by the Board of Governors of the Federal Reserve System. Data shown prior to 1914 are almost wholly dependent on the reports of the Comptroller of Currency, since the *Banking and Monetary Statistics* generally covers only the period beginning with 1914. Subsidiary documents also used have already been referred to above, namely, the *Member Bank Call Report* and the *Federal Reserve Bulletin*. For more detailed information concerning the data shown here, the user will be well advised to consult the aforementioned publications.

*Bank defined.* "For general statistical purposes it may be said that a bank is a financial institution which accepts money from the general public for deposit in a common fund, subject to withdrawal or to transfer by check on demand or on short notice, and makes loans to the general public. This definition comprehends national banks (which are chartered by the Federal Government), banks organized under State laws (including commercial banks, trust companies, mutual and stock savings banks, industrial banks, and cash depositories), and unincorporated banks (private banks and bankers). It excludes building and savings and loan associations, personal loan and other small-loan companies, credit unions, mortgage companies, sales finance companies, insurance companies, and credit agencies owned in whole or in part by the Federal Government"—*Banking and Monetary Statistics*, Board of Governors of the Federal Reserve System, 1943, p. 6.

#### PRINCIPAL ASSETS AND LIABILITIES OF BANKS (N 1-59)

*Assets and liabilities* are defined here in their usual accounting meaning. *Assets* are the resources of banks such as loans, investments, reserves, cash and balances with other banks; *liabilities* are the charges against these resources. *Principal liabilities* are demand and time deposits and capital accounts. *Capital accounts* include (1) the funds originally paid in by the banks' owners, for which they ordinarily receive stock certificates, (2) surplus, which generally consists of that part of earnings specifically set aside as a permanent part of the capital structure, and (3) undivided profits, which consist of profits not yet declared as dividends or alternatively not yet put into surplus.

N 1-12. **Second Bank of the United States, 1817-1840.** SOURCE: *Annual Report of Comptroller of Currency*, 1876, p. lxxxiii. Series N 5 (due from State and foreign banks) is a combination of two series shown separately in the original source: "Due by European bankers" and "due from State banks"; the same type of combina-

nation was made to obtain data for series N 11 (due to State and foreign banks).

The Second Bank was chartered by Congress in 1816 for 20 years. The renewal of the charter was denied and reorganization was effected by means of the authority of the Legislature of the State of Pennsylvania. The bank failed (assigned) in 1841, the affairs being finally liquidated in 1856, and resulted in payment in full, interest and principal, of liabilities to depositors and note-holders. The shareholders, however, received nothing on their investment in stock of the bank. See headnote, table 94, p. 912, *Annual Report of the Comptroller of Currency*, 1916, vol. II. That volume also, on p. 912, shows resources and liabilities of the first Bank of the United States in 1809 and 1811, the only 2 years for which data appear to be available.

**N 13-18. Colonial and State banks, 1774-1833.** SOURCE: *Annual Report of Comptroller of Currency*, 1920, vol. 2, table 93, p. 846. Data are derived from figures shown in the *Annual Report of the Comptroller of Currency*, 1876, p. xxxix, ff., and from Sound Currency Committee of the Reform Club, *Sound Currency*, vol. II, No. 13, New York City, June 1895. The 1876 report includes a discussion of these data.

**N 19-26. All banks, principal assets and liabilities, 1834-1945.** SOURCE: *Annual Reports of the Comptroller of the Currency* as follows: For data for 1834-1919, see *Annual Report* for 1931, tables 94-96, pp. 1018-25; for 1920-1935, see *Annual Report* for 1941, tables 69-71, pp. 298-300; for 1936-1945, see *Annual Report* for 1945, tables 39-41, pp. 158-160. The figures for 1834-1840 are from Executive Document No. 111, Twenty-sixth Congress, second session. Those for 1841-1850 are from Executive Document No. 68, Thirty-first Congress, first session. For the years 1851-1863 (except 1852-1853) figures are from the report on the condition of banks for 1863. Those for 1853 are from Executive Document No. 66, Thirty-second Congress, second session, and are incomplete. See *Annual Report*, 1920, vol. 2, footnote, p. 847.

The historical tables in the 1931 *Annual Report of the Comptroller of the Currency*, pp. 1018-1025, provide summary statistics by single years, 1834-1931, for (a) all reporting banks, (b) national banks (1863-1931), and (c) all reporting State and private banks (that is, nonnational banks). See also the *Annual Report* for 1876, 1895, and 1920, in particular, for historical tables on banking statistics.

The figures shown here include data for all national banks, for all State banks that report to State banking departments in the United States and possessions, and for mutual and stock savings banks, loan and trust companies, and private banks so far as reported. Data for banks other than national for the earlier years are reported for dates other than June 30 and are incomplete, especially through 1885; many of the items shown for those earlier years have been estimated. In the years 1933 and 1934 only licensed banks, that is, those operating on an unrestricted basis, are included.

**N 19-20. All banks, number, and total assets or liabilities, 1834-1945.** SOURCE: See text for series N 19-26. These data do not correspond exactly to a somewhat similar compilation in the Federal Reserve System's *Banking and Monetary Statistics*, since the Comptroller of the Currency figures include branches as separate banks.

**N 21. Loans and discounts, including overdrafts, 1834-1945.** SOURCE: See text for series N 19-26. Excludes acceptances of other banks and bills of exchange or drafts sold with endorsements for national and State commercial banks beginning with 1920 and for other banks beginning with 1929. *Loans, discounts, and overdrafts* are three types of bank lending. Such lending is referred to as a loan when the borrower receives the entire principal and at maturity repays the principal plus interest; as a discount when the borrower receives the principal less the interest and at maturity repays the principal; as an overdraft when a bank honors a check written in excess of the depositor's balance.

**N 22. United States Government and other securities, 1834-1945.** SOURCE: See text for series N 19-26. Includes securities borrowed, for national banks prior to 1903, and for other banks prior to 1929. For national banks for years 1863, 1864, and 1865, excludes securities other than United States Government's which, in the source, are included in "other assets." *United States Government securities* are direct or indirect obligations of the United States Government. Other securities include primarily obligations of State and municipal governments, foreign governments, and corporations.

**N 23. Cash and balances with other banks, 1834-1945.** SOURCE: See text for series N 19-26. These data include reserve balances which banks are required to maintain with other banks including the Federal Reserve Banks; cash items, such as checks, drafts, notes or acceptances, in process of collection; and cash in vault. Prior to 1936 cash items not in process of collection are included.

**N 24. Capital, surplus, and net undivided profits, 1834-1945.** SOURCE: See text for series N 19-26. Includes reserve accounts except that reserves for expenses accrued and unpaid are excluded for national banks beginning with 1920 and for other banks beginning with 1929. For banks other than national, prior to 1873, figures include capital only, and beginning in 1934 capital notes and debentures are included. *Reserve accounts* are liability accounts established to provide for such possibilities as depreciation, bad debts, depletion, market value depreciation of securities owned and probable losses. *Capital, surplus, and net undivided profits* represent the equity of the owners in the bank. *Capital* is here used to designate primarily the original contribution of bank owners to the bank and is ordinarily evidenced by bank stock certificates. *Surplus* is ordinarily the amount of bank earnings specifically set aside as capital funds. *Net undivided profits* are earnings not yet set aside for dividend or allocated to surplus.

**N 25. Circulation, 1834-1945.** SOURCE: See text for series N 19-26. Figures for national banks, and for all banks for the period 1870-1910, exclude comparatively small amounts of State bank notes outstanding for which national banks, converted from State banks or merged with State banks, assumed liability. For a series on estimated total of all State bank notes outstanding, 1800-1830 (decennially) and 1831-1863 (annually), see *Annual Report of the Comptroller of Currency*, 1916, vol. II, table 28, p. 45.

**N 26. Total deposits, 1834-1945.** SOURCE: See note for series N 19-26. Figures for national banks for years 1863-1865 include State bank circulation outstanding; and for years 1866-1868, include bills payable and rediscounts.

**N 27-34. National banks, principal assets and liabilities, 1863-1945.** SOURCE: See text for series N 19-26. See also general note for series N 1-147 for origin of national banks. *National banks* are those chartered by and under the general supervision of the Comptroller of the Currency of the United States.

**N 35-42. Nonnational banks, principal assets and liabilities, 1860-1945.** SOURCE: See text for series N 19-26. Includes data for State commercial banks, mutual and stock savings banks, private banks, and loan and trust companies. Prior to 1863, nonnational banks comprised all banks (see general note for series N 1-147).

**N 43-44. Savings banks, number, and total assets or liabilities, 1875-1945.** SOURCE: *Annual Reports of Comptroller of Currency*. Comprises both mutual and stock savings banks, 1875-1911; thereafter represents mutual savings banks only with a few exceptions. Stock savings banks, 1912-1945, are included with State commercial banks. See text for series N 19-26. For principal assets and liabilities of savings banks comparable in detail with those shown in series N 19-26 for all banks, see individual *Annual Reports*. *Savings banks* differ from *commercial banks* in that they accept only savings and other time deposits and they invest their funds mostly in mortgage loans and securities. *Mutual savings banks* are owned by their depositors; *stock savings banks* by stockholders of the bank. The great majority of stock savings banks

accept both demand and time deposits and transact the same kinds of business as do commercial banks. Hence, in recent years they have been classified with commercial banks.

**N 45-46. State commercial banks, number, and total assets or liabilities, 1875-1945.** SOURCE: *Annual Reports of Comptroller of Currency*. Also see sources and comments for series N 19-26 (all banks). For the period 1863-1874, the data available are the same as for nonnational banks, series N 35-42. These statistics for State commercial banks include loan and trust companies and, beginning with 1912, stock savings banks. Principal assets and liabilities for these banks comparable in detail with those shown for all banks (series N 19-26), are available in the source volumes. *State commercial banks* are those chartered by and under the general supervision of the States in which they operate.

**N 47-48. Private banks, number, and total assets or liabilities, 1887-1945.** SOURCE: *Annual Reports of the Comptroller of the Currency*. Except for 1934 and 1935, these statistics cover only banks under State supervision and those voluntarily reporting; for 1934 and 1935, they include also private banks which submitted reports to the Comptroller of the Currency under provisions of the Banking Act of 1933. See comments regarding all banks (N 19-26). Principal assets and liabilities for private banks comparable in detail with those shown for all banks (series N 19-26) are available in the source volumes. *Private banks* are unincorporated banks that operate ordinarily without a charter either from the State or Federal Government. Since 1933 such banks in order to receive deposits have had to submit to examination by either State or Federal banking authorities.

**N 49-55. All member banks of the Federal Reserve System, principal assets and liabilities, 1915-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1915-1941, see *Banking and Monetary Statistics*, 1943, table 18, pp. 72-75; for 1942-1945, see *Member Bank Call Report*, No. 100, June 30, 1945, page 2. For a detailed description of the present composition of the items and of historical changes in the composition of these items, see *Banking and Monetary Statistics*, pp. 61-71, and footnotes, pp. 74-75. For member bank data on earnings and expenses, see series N 68-75.

Statistics shown here cover member banks in *active* operation. *Member banks* comprise all national banks in continental United States, which are required by law to be members of the Federal Reserve System, and such State banks and trust companies as have applied for and been admitted to membership.

Most of the items shown here represent a combination of several items shown separately in the source: "Investments" (N 52) is a combination of "United States Government obligations" and "other securities." "Cash and balances with other banks" (N 53) is a total of "reserves with Federal Reserve Banks," "cash in vault," "balances with domestic banks," "balances with foreign banks," and "cash items in process of collection." "Total deposits" (N 55) comprises "interbank," "United States Government," "postal savings," "other demand" and "other time" deposits. "Capital accounts" (N 54) represents "common stock," "preferred stock," "surplus," "undivided profits," and "reserves for contingencies." In addition the original sources include for some or all of the years the following items: "Due from own foreign branches," "bank premises, furniture, and fixtures," "other real estate owned," "investments and other assets indirectly representing bank premises or other real estate," "customers' liability on acceptances," "securities borrowed," "income accrued but not yet earned," "other assets," "due to own foreign branches," "bills payable, rediscounts and other liabilities for borrowed money," "acceptances outstanding," "dividends declared but not yet payable," "income collected but not yet earned," "expenses accrued and unpaid," "other liabilities," "net demand deposits subject to reserve," "demand deposits adjusted," and "reciprocal bank balances."

**N 56-59. Nonmember commercial banks, 1915-1945.** (Commercial banks not members of the Federal Reserve System). SOURCE: Board of Governors of the Federal Reserve System. For data for 1914-1941, see *Banking and Monetary Statistics*, table 6, pp. 22-23; for 1942-1945, see *Federal Reserve Bulletin*, September 1944, p. 897, and June 1946, p. 633. For a more complete description of these series, see *Banking and Monetary Statistics*, pp. 8-10.

*Nonmember commercial banks* include all State banks except banks that are members of the Federal Reserve System and mutual savings banks. Figures exclude private banks not reporting to State banking authorities except that from 1928-1934 certain large private banks not reporting to State banking authorities are included. Banks in United States possessions are excluded. The figures for some of the earlier years are rough approximations.

In the original sources the following investment items are shown separately: "United States Government securities" and "other securities." Also, the following deposit items are shown separately: "interbank" and "other." In recent years, "other deposits" has been further classified as "demand" and "time."

#### EARNINGS AND EXPENSES OF BANKS (N 60-75)

**N 60-75. General note.** The earliest available bank earnings data are those for national banks beginning in 1869. National banks were required to make earnings reports whenever dividends were declared for the years 1869-1871. From 1871 to 1916 earnings reports had to be submitted at least semiannually whether dividends were declared or not declared. From 1916 to present, earnings reports have been required for the periods ending in June and December. The data required in these earnings reports has become progressively more detailed and more comprehensive.

**N 60-67. National banks, earnings and expenses, 1869-1945.** SOURCE: For 1869-1941, see Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, table 56, pp. 260-261; for 1942-1945, see *Annual Reports of the Comptroller of the Currency*, as follows: *Annual Report*, 1943, tables 5 and 6, pp. 30-31, and *Annual Report*, 1945, tables 15 and 16, pp. 96-97. The statistics include all national banks in the United States and possessions.

More detailed data than shown in these series are available for part of the period in the *Annual Report of the Comptroller of the Currency*. For example, earnings and expenses are available by type; recoveries and profits and losses and charge-offs are shown by character of asset. Beginning in 1943, income taxes are available separately from other taxes. Other earnings ratios are also available for part of the period.

Series N 64 (net losses or net recoveries) is the excess of total losses and charge-offs (including depreciation) over total recoveries and profits, or vice versa.

**N 68-75. Member banks of the Federal Reserve System, earnings and expenses, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, tables 57 and 58, pp. 262-265; for 1942-1945, see *Federal Reserve Bulletin*, June 1946, pp. 674 and 681. For a definition of member banks, see text for series N 49-55.

Series N 72 (net losses or net recoveries) is the excess of total losses and charge-offs over total recoveries and profits (shown separately in the source volumes) or vice versa. Prior to 1927, profits on securities are included in current earnings (N 71); beginning with 1927 they are shown separately (in the source volume) and are treated as an addition to net current earnings.

More detailed data than shown here are available in the sources indicated. For example, earnings and expenses are available by type; recoveries and profits and losses and charge-offs are shown by character of asset. Beginning in 1942 income taxes are available separately from other taxes. Other earnings ratios are also shown in the original source volumes.

BANK DEBITS, DEPOSIT TURNOVER, AND BANK CLEARINGS  
(N 76-89)

**N 76-85. General note.** *Bank deposits* are the major portion of the current means of payment. The extent to which such deposits are used (deposit turnover) may be a significant measure of business activity in that period. These data must be used with care, however. Increased business activity, for example, may result in a proportionately greater increase in bank deposits than in bank debits. In such a case, the rate of deposit turnover would be somewhat lower than the increase that might be expected or even somewhat lower than that prevailing in a preceding or subsequent period of less business activity.

**N 76-79. Bank debits to deposit accounts, except interbank accounts, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, table 51, pp. 234-237; for 1942-1945, see *Federal Reserve Bulletin*, June 1946, p. 630. Data for individual reporting centers, by months, from 1919-1941, are available in *Banking and Monetary Statistics*; for 1941 to date, they are available upon request from the Board of Governors of the Federal Reserve System. For monthly data on New York City and "outside New York City," see appendix I, series App. 16-17.

Figures represent debits or charges on books of reporting member and nonmember banks to deposit accounts of individuals, partnerships, and corporations, the United States Government, and State, county, and municipal governments, including debits to savings accounts, payments from trust accounts, and certificates of deposit paid. Debits to accounts of other banks or in settlement of clearinghouse balances, payment of certified and officers' checks, charges to expense and other accounts, corrections and similar charges are not included. For a more detailed description of the data see *Banking and Monetary Statistics*, pp. 230-233.

**N 80-85. Bank debits and deposit turnover, excluding interbank deposits and collection items, at all commercial banks, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, table 55, p. 254. Data for 1942-1945 are from records of the Division of Research and Statistics, Board of Governors of the Federal Reserve System. Data similar to those shown here are available in the source volumes for member banks in New York City and 100 other leading cities, as well as for all other commercial banks.

For a definition of debits, see text for series N 76-79. The rate of turnover of deposits is obtained by dividing the volume of debits during a period by the average amount of deposits over the same period. Figures shown here are in part estimated; for a description of these series see *Banking and Monetary Statistics*, p. 232.

**N 86-89. Bank clearings at principal cities, 1854-1945.** SOURCES: For 1854-1881, see *Annual Report of the Comptroller of the Currency*, 1920, vol. 2, table 97, p. 849; for 1882-1936 (except series N 89), see *Statistical Abstract of the United States*, 1937, table 293, p. 268; for 1937-1945, see *Statistical Abstract*, 1947, table 472, p. 444. For series N 89 for 1920-1936, see *Statistical Abstract*, 1938, table 301, p. 275.

For 1882-1919, figures are for all cities reporting to New York Clearing House Association and cover years ending September 30. Beginning 1920 all figures are for calendar years. The *Annual Report of the Comptroller of Currency*, 1920, vol. 2, p. 849, gives for New York the number of banks, capital, balances, average daily clearings, and average daily balances, 1854-1920.

The comparability of these figures is affected by (1) changes in the number of cities reporting and (2) the tendency toward consolidation of banks, eliminating former clearings between two or more banks. The source volume suggests that series N 76-79 are better measures of volume of payment. For 1920-1936, series N 88 is for 146 identical cities.

BRANCH BANKING (N 90-98)

**N 90-98. Branch banking, 1900-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1900-1941, see *Banking and Monetary Statistics*, table 73, p. 297, for 1942-1945, see monthly issues of *Federal Reserve Bulletin* as follows: July 1943, pp. 687-688; June 1944, pp. 612-613; June 1945, pp. 616-617; June 1946, pp. 672-673. Detailed statistics on branch banking, by States and by class of bank, for selected years, are available in the sources indicated.

*Branch banking* is defined as a type of multiple office banking under which a bank as a single legal entity operates more than one banking office. If a bank operates a single branch office, irrespective of size, it is included here. Furthermore, the statistics on branches shown here include all branches or additional offices (except seasonal agencies) within the meaning of section 5155, United States Revised Statutes, which defines *branch* as "any branch bank, branch office, branch agency, additional office, or any branch place of business \* \* \* at which deposits are received, or checks paid, or money lent." Seasonal agencies operate only for limited periods and under special authority; therefore, they have not been included. For 1942-1945, figures also include banking facilities at military reservations.

Branch banking is not to be confused with group and chain banking. *Group and chain banking* refers to types of multiple office banking which differ from branch banking principally in legal form and type of control. For data on group and chain banking, see sources cited above.

SAVINGS BANKS AND DEPOSITS (N 99-113)

**N 99-106. Savings and other time deposits and depositors, 1910-1942.** SOURCE: *Statistical Abstract of United States*, 1946, table 423, p. 404. These data were furnished by the American Bankers Association, which did not continue this series after 1942. Savings and other time deposits include deposits evidenced by savings passbooks, time certificates of deposit payable in 30 days or overtime deposits, open account, postal savings redeposited in banks, and for some States, Christmas savings and similar accounts.

"State, etc., banks" (series N 101) includes commercial, stock savings, and private banks and trust companies. Data shown for some of the years for these banks are incomplete for some States or have been estimated for others. Figures for these banks exclude 6 States in 1926 and 1927, 4 in 1928 to 1930, 3 in 1931, 2 in 1932 and 1933, and 1 in 1934 to 1937. For the period 1929-1942 depositors at national banks are represented by the number of savings passbook accounts.

**N 107-108. Savings banks, number of depositors and amount of deposits, 1820-1910.** SOURCES: For 1820-1896, see *Annual Report of Comptroller of Currency*, 1896, vol. I, table XVII, p. 720; for 1897-1910, see *Statistical Abstract of United States*, 1946, table 422, p. 404.

Prior to 1900, data include both mutual and stock savings banks; beginning 1900 they are for mutual savings banks only, which in that year had about 90 percent of the savings deposits in all savings banks. Data for later years are for June 30 or about June 30. In earlier years reports were of various dates.

**N 109-113. Postal Savings system, 1911-1945.** SOURCE: *Annual Report of the Postmaster General*, 1945, table 18, p. 72.

Data are for fiscal years since the inception of the Postal Savings system. Current data on the Postal Savings system are available monthly in the *Federal Reserve Bulletin*, and annually in Office of Postmaster General, *Report of Operation of the Postal Savings Systems*.

FEDERAL RESERVE BANKS (N 114-134)

**N 114-134. General note.** For purposes of the Federal Reserve System the country is divided into 12 districts. There is a Federal

Reserve Bank in each district and most have one or more branches. Federal Reserve Banks are organized as Federal corporations with capital stock subscribed by member banks in the respective districts.

Federal Reserve Banks perform central banking functions for their respective districts. As such they hold the legal reserves of member banks, furnish currency for circulation, facilitate the collection and clearances of checks, provide discount facilities, exercise supervisory duties with respect to member banks and act as fiscal agents, depositories and custodians for the United States Government in its fiscal operations. In addition, Federal Reserve Banks are the principal medium through which the credit policies and general supervisory powers of the Board of Governors of the Federal Reserve System are effected. The Federal Reserve Banks are coordinated and supervised by the Board of Governors of the Federal Reserve System.

**N 114-123. Federal Reserve Banks, principal assets and liabilities, 1914-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1914-1941, see *Banking and Monetary Statistics*, table 85, pp. 330-332; for 1942-1945, see *Annual Reports of the Board of Governors of the Federal Reserve System*, as follows: *Annual Report* for 1943, table 2, pp. 62-63 and *Annual Report* for 1945, table 2, pp. 64-65. A complete and detailed balance sheet for all Federal Reserve Banks combined and for each Bank is included in the source volumes. For further description of the items included here see *Banking and Monetary Statistics*, pp. 324-329.

Reserves of Federal Reserve Banks include gold and gold certificates on hand and due from United States Treasury, redemption fund for Federal Reserve notes, and other cash.

Deposits of Federal Reserve Banks consist mainly of reserves of member banks, shown separately here. They also include the checking account of the United States Treasury, deposits of foreign banks and Governments, and other accounts, such as deposits maintained by certain nonmember banks for use in clearing and collecting checks and checking accounts of Government agencies.

**N 124-130. Federal Reserve Banks, earnings and expenses, 1915-1945.** SOURCE: *Annual Report of the Board of Governors of the Federal Reserve System*, 1945, table 7, pp. 72-73. The item "transferred to surplus" for the period 1934-1945 is a combination of two items shown separately in the source: "Transferred to surplus (sec. 7)" and "transferred to surplus (sec. 13b)." (The section numbers refer to the Federal Reserve Act.)

Federal Reserve Banks are not operated for profit but they are self-supporting. The nature and the amount of Reserve Bank earnings depend largely upon the demand for Reserve Bank credit on the part of member banks and upon Federal Reserve policy as to open-market operations. Most of the expenses of the Reserve Banks are incurred in collecting checks, supplying currency, and performing other services from which no earnings are derived.

**N 131-134. Member Bank reserve requirements, 1917-1945.** SOURCE: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, March 1947, p. 282. These data represent minimum reserve requirements as specified by law (amendment to the Federal Reserve Act effective June 21, 1917). Since 1935 the Federal Reserve Board has been authorized to increase these minimum requirements up to double the various specified percentages and, as noted in these series, requirements have been changed from time to time. Prior to June 21, 1917, member banks were authorized to hold a part of their reserves as cash in their own vaults and a part on deposit with other banks. Since that date, only balances with Reserve Banks have counted as legal reserves.

#### BANK SUSPENSIONS (N 135-147)

**N 135-147. Bank suspensions, 1864-1945.** SOURCES: For 1864-1891, see *Annual Report of the Comptroller of the Currency*, 1931, pp. 1040-1041; for 1892-1945, see publications of the Board of Governors of the Federal Reserve System, as follows: For 1892-

1941, see *Banking and Monetary Statistics*, table 66, p. 283; for 1942-1945 totals, see *Federal Reserve Bulletin*, June 1946, p. 631.

Comprehensive and dependable statistics on bank suspensions are available only for comparatively recent years, that is, beginning with 1921. Statistics for State banks prior to 1892 are fragmentary and incomplete. While the figures shown for the period 1892-1920 are believed to be somewhat more reliable than for earlier years, they are not strictly comparable with the figures shown for the period 1921-1945. Prior to 1921 the figures may be useful principally in showing the periods of abnormal banking mortality.

Beginning with 1921 more detailed data are available on the number and deposits of suspended banks. These data were compiled from original reports on bank suspensions. The term "bank suspension" has been defined to comprise all banks closed to the public, either temporarily or permanently, by supervisory authorities or by the banks' boards of directors on account of financial difficulties, whether on a so-called moratorium basis or otherwise, unless the closing was under a special banking holiday declared by civil authorities, in which case, if the bank remained closed only during such holiday, it was not counted as a suspension. Banks which, without actually closing, merged with other banks or obtained agreements with depositors to waive or to defer withdrawal of a portion of their deposits likewise have not been counted as suspensions; but banks which closed and were later reopened or taken over by other institutions have been included as suspensions.

For 1864-1891, all series are for the year ending June 30; for 1892-1920, figures for national and State banks are for the calendar year; for 1921-1945, all series are for the calendar year. For private banks (series N 138), figures for 1892-1920 vary in ending date of reporting year as follows: For 1892, June 30; for 1893 (14 months), Aug. 31; for 1894-1899, Aug. 31; for 1900-1919, June 30; and for 1920 (18 months), Dec. 31. Series N 135 (total) for 1892-1920 is composite as to reporting period since it comprises the summation of series N 136-138.

Deposits for member banks are as of the date of suspension, and for nonmember banks as of the date of suspension or latest available call date prior thereto, with the exception of unlicensed banks included for 1933. Deposits of unlicensed banks included in suspensions for 1933 are (1) for national banks, as of the date of conservatorship; (2) for State member banks, as of June 30, 1933, or the nearest call date prior to liquidation or receivership; and (3) for nonmember banks, the latest figures available at the time the banks were reported as having been placed in liquidation or receivership, or (for those which later reopened) as of the date license was granted to reopen.

Figures for losses borne by depositors (series N 147) are from the *Annual Report of the Federal Deposit Insurance Corporation*, 1940, p. 66, except for the figure for 1941, which is an unpublished estimate made by the Corporation. For 1935-1941, the figures include some losses in insured banks which were not classified as bank suspensions but which were merged with the financial aid of the Federal Deposit Insurance Corporation. For the same period, the figures also include about 47 million dollars of losses borne by the Federal Deposit Insurance Corporation. Prior to 1921, figures on estimated losses borne by depositors are available by periods as follows: 1881-1900, 93 million dollars; 1901-1920, 139 million dollars (*Annual Report*, 1940, p. 62).

More detailed statistics for the period 1921-1941 are available in the source volume, including the number and deposits of suspended banks by States, by years, and by class of bank.

#### Currency and Gold: Series N 148-184

**N 148-165. Currency, 1800-1945.** SOURCE: See text for specific series below. *Currency* includes coin and paper money issued by the Government and by banks. It represents a relatively small part of

the total media of exchange in the United States, for most of it is held in the form of bank deposits and most money payments are made by check. All currency is now issued by the Federal Reserve Banks and the Treasury.

*Currency in circulation or money in circulation* (official Treasury Circulation Statement) refers to all coin and paper money outside the Treasury and Federal Reserve Banks, with the exception of gold and silver coin known to have been exported and, beginning with January 31, 1934, all gold coin. It includes all coin and paper money held by the public in the United States whether in current active use or held idle—also some currency which, strictly speaking, is not a part of the money supply in the hands of the public, that is, cash in vaults of commercial and savings banks, currency lost or destroyed, and currency carried abroad by travelers and not appearing in the official gold and silver export figures.

**N 148-151. Money stock and money in circulation, 1800-1945.** SOURCE: For 1800-1859, see *Annual Report of the Comptroller of the Currency*, 1896, vol. I, p. 544; for 1860-1912, see *Annual Report of the Secretary of the Treasury*, 1928, pp. 550-551; for 1913-1945, see *Treasury Annual Report*, 1945, p. 675.

The totals for money stock (series N 148) involve a duplication to the extent that United States notes, Federal Reserve notes, Federal Reserve Bank notes, and national bank notes, all included in full, are in part secured by gold, also included in full. Gold certificates, silver certificates, and Treasury notes of 1890 have been excluded, however, since they are complete duplications of the equal amounts of gold or silver held as security therefor and included in the totals. For a statement on this point and a description of security by type of money, see text for series N 152-165 below.

The following statement is adapted from tabular footnotes in *Annual Report of the Secretary of the Treasury*, 1928 issue, p. 557, and 1945 issue, p. 675:

The figures for 1860-1889 have been revised from the best data available in annual reports of the Secretary of the Treasury. The records are not complete and the figures for gold and silver in those years are only estimates. Beginning with 1890, the compilation is based on revised figures for June 30 of each year and therefore differs slightly from the monthly circulation statements issued by the Treasury. Beginning June 30, 1922, the form of the circulation statement was revised so as to include in the holdings of the Federal Reserve Banks and agents, and hence, include in the stock of money, gold bullion and foreign gold coin held by the Federal Reserve Banks and agents; and was also revised so as to include in the holdings of the Federal Reserve Banks and agents, and hence, exclude from money in circulation, all forms of money held by the Federal Reserve Banks and agents whether as reserve against Federal Reserve notes or otherwise. For full explanation of this revision, see *Treasury Annual Report*, 1922, p. 433.

Beginning December 31, 1927, the form of the monthly circulation statement was revised so as to exclude earmarked gold coin from the stock of money, and hence from money in circulation; and to include in the holdings of the Federal Reserve banks and agents, and hence in the stock of money, gold coin, and bullion held abroad for the account of the Federal Reserve Banks. These changes do not affect the figures prior to the establishment of the Federal Reserve System. For the sake of comparability, the figures from 1915 on, as shown here, have been compiled on the basis of the revisions mentioned. Beginning on December 31, 1927, the monthly circulation statement was also revised to include minor coin (the bronze 1-cent piece and the nickel 5-cent piece) throughout. For the sake of comparability, the figures from 1910 on, as shown here, have been revised to include minor coin. Satisfactory data on minor coin for earlier years were not available and the amount was small.

The circulation statement beginning on December 31, 1927, is dated for the end of the month instead of the beginning of the succeeding month as was the practice theretofore, and figures on a revised basis for "money held in Treasury" are used. For full explanation of this revision, see *Treasury Annual Report*, 1928, pp. 70-71. Final revisions, minor in amount, are made in some figures of the June 30 circulation statements for use in the annual report tables.

**N 152-165. Money in circulation by kind, 1860-1945.** SOURCE: For 1860-1913, see *Annual Report of the Secretary of the Treasury*, 1928, pp. 554-555; for 1914-1945, see *Treasury Annual Report*, 1945, p. 677. See also text for series N 148-165.

More detailed data on money stock and circulation, by kind, annually, are shown in the various annual reports of the Secretary of the Treasury and the Comptroller of the Currency. For a continuation of series N 157 (State bank notes, 1860-1878), annually back to 1830, decennially to 1800, see *Annual Report of the Comptroller of the Currency*, 1916, vol. II, table 28, p. 45.

The security held for redemption of gold certificates, silver certificates, etc., is described in the *Treasury Annual Report*, 1945, in a footnote to table 91, p. 676, as follows:

A part of the gold and silver included in the stock of money is held as a reserve against other kinds of money as follows: (1) as a reserve for United States notes and Treasury notes of 1890—gold bullion varying in amount from \$150,000,000 to \$156,039,431 during the years 1913-1945; (2) as security for Treasury notes of 1890—an equal dollar amount in standard silver dollars (these notes are being cancelled and retired on receipt); (3) as security for outstanding silver certificates—silver in bullion and standard silver dollars of a monetary value equal to the face amount of such silver certificates; and (4) as security for gold certificates—gold bullion of a value at the legal standard equal to the face amount of such gold certificates. Federal Reserve notes are obligations of the United States and a first lien on all the assets of the issuing Federal Reserve Bank. Federal Reserve notes are secured by the deposit with Federal Reserve agents of a like amount of gold paper as is eligible under the terms of the Federal Reserve Act, or until June 30, 1945, of direct obligations of the United States if so authorized by a majority vote of the Board of Governors of the Federal Reserve System. Federal Reserve Banks must maintain a reserve in gold certificates of at least 40 percent, including the redemption fund which must be deposited with the Treasurer of the United States, against Federal Reserve notes in actual circulation. "Gold certificates," as herein used, includes credits with the Treasurer of the United States payable in gold certificates. Federal Reserve Bank notes and national bank notes are in process of retirement. The monetary value of gold was changed from \$20.67 per fine ounce to \$35.00 per fine ounce on January 31, 1934. The weight of the gold dollar was reduced from 25.8 to 15 $\frac{1}{2}$  grains of gold, 0.9 fine.

In respect to national bank notes, the *Treasury Annual Report*, 1928, in a footnote to table 63, p. 557, states:

National bank notes are secured by United States bonds except where lawful money has been deposited with the Treasurer of the United States for their retirement. A 5-percent fund is also maintained in lawful money with the Treasurer of the United States for the redemption of national bank notes secured by Government bonds.

**N 166-171. Changes in gold stock of the United States, 1914-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1914-1941, see *Banking and Monetary Statistics*, table 156, p. 536; for 1942-1945, see *Federal Reserve Bulletin*, January 1947, p. 52. For a discussion of the items shown here, see *Banking and Monetary Statistics*, p. 522. Monthly data are also available in that source.

At one time gold circulated freely as money and was the basic form into which all other types of money could generally be converted. At present, however, the gold stock in most countries is held largely or entirely by central banks and government treasuries as a legal reserve against note and deposit liabilities or for stabilizing exchange rates. All gold belonging to the United States is held by the Treasury Department. Private gold holdings are forbidden except in limited amounts for licensed purposes. Gold may be held by Federal Reserve Banks for account of foreign central banks or governments. Such earmarked gold, however, is not a part of the monetary gold stock of this country.

The data for domestic gold production (series N 168) are those reported by the Director of the Mint, adjusted to exclude Philippine Islands production received in the United States. The data for net gold imports (series N 169) are those compiled by the De-

partment of Commerce. The figures for gold under earmark (series N 170-171) represent gold held by the Federal Reserve Banks for foreign account; in the calculation of the changes in gold under earmark, however, consideration has also been given to gold held under earmark abroad for the account of the Federal Reserve Banks in the years 1917-1933.

**N 172-178. Adjusted deposits of banks and currency outside banks, 1892-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1892-1941, see *Banking and Monetary Statistics*, table 9, pp. 34-35; for 1942-1945, see *Federal Reserve Bulletin*, January 1947, p. 53. These figures provide an indication of the total volume of the means of payment outstanding in the country. The *supply of money*, in the sense of a means of payment, is generally defined to include currency and demand deposits of banks. Time deposits are also sometimes included in measures of money supply, although in general they probably represent savings and not funds intended to be used for current expenditures.

These data have been adjusted to show as nearly as possible the deposits and currency owned by the public. Currency held as vault cash has been deducted from the total amount of currency outside the Treasury and Federal Reserve Banks. Deposit figures have been adjusted to exclude interbank deposits, which do not represent money available to the public, and items in process of collection, inclusion of which would represent a double counting of deposits. For a detailed description of these series and their significance see *Banking and Monetary Statistics*, pp. 11-12.

**N 179-182. Amount coined of gold, silver and minor coin, 1793-1945.** SOURCE: *Annual Reports of the Director of the Mint*. For 1793-1943, see *Annual Report* for 1944, pp. 72-73; for 1944, see *Annual Report* for 1945, p. 87; for 1945, see *Annual Report* for 1946, p. 49.

**N 183-184. Silver prices, 1789-1945.** SOURCE: *Annual Reports of the Director of the Mint*. For 1789-1941, see report for 1941, pp. 90-91; for 1942-1945, see report for 1946, pp. 69 and 70.

Data on average commercial ratio of silver to gold are available back to 1687 in the 1941 *Annual Report*. From 1789 to 1832, average commercial ratios of silver to gold are taken from Dr. A. Soetbeer; from 1833 to 1878, from Pixley and Abell's tables; from 1879 to 1896, from daily cabled prices from London to the Bureau of the Mint; from 1897 to 1914, from daily London quotations; and since, from daily New York quotations.

### Money Rates and Security Markets: Series N 185-232

**N 185-187. Short-term open-market rates in New York City, 1890-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1890-1941, see *Banking and Monetary Statistics*, table 120, p. 448; for 1942-1945, see *Federal Reserve Bulletin*, March 1944, p. 263, and January 1947, p. 63.

Short-term open-market rates shown here are for New York City which is the chief money market in this country. The New York money market is composed of a number of specialized markets for certain types of loans and there are usually differences in rates corresponding to differences in the supply of funds relative to the demand for the particular type of loan in which the market deals. These markets are called "open" markets since transactions in them are usually made on an impersonal basis with the borrower and lender dealing through agents, as distinct from a "customer" market where the borrower and lender deal directly with each other and where transactions are often made on a personal basis. As a result, lenders may sell paper held, call loans, or refrain from renewing credits upon maturity more freely in the case of open-market paper than in the case of customer loans. Until recent years, the 1930's, 90-day Stock Exchange time loans (series N 185), prime 4- to 6-month commercial paper (series N 186), and Stock Exchange renewal call loans (series N 187) were the most important short-term open-market instruments.

Annual average rates on Stock Exchange call loans (new) are also available in *Banking and Monetary Statistics* from 1919-1941. Monthly and weekly figures for all of the items are given in the source volume.

**N 188-195. Commercial and customer bank loan rates, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, tables 124 and 125, pp. 463-464; for 1942-1945, see *Federal Reserve Bulletin*, December 1946, p. 1383. Data by months are available in the source volumes. These data are compiled by the Board of Governors from reports submitted by member banks in leading cities throughout the country.

Figures for series N 192-195 represent averages of prevailing rates reported monthly by banks in a varying number of leading cities on commercial loans and time and demand security loans. For series N 188-191, data for Jan. 1928-Feb. 1939 are averages of prevailing rates reported monthly by banks in 19 principal cities on commercial loans only; beginning in March 1939 the figures are averages of interest rates charged by banks in 19 cities on commercial and industrial loans made during the first half of March, June, September, and December. For a description of the figures, see *Banking and Monetary Statistics*, pp. 426-427.

**N 196-200. Basic yields of corporate bonds, by term to maturity, 1900-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1900-1942, see *Banking and Monetary Statistics*, table 131, p. 477; for 1943-1945, data were furnished from records of the Federal Reserve Board. Data shown for 1900-1942 are originally from Durand, David, *Basic Yields of Corporate Bonds, 1900-1942*, National Bureau of Economic Research, New York, 1942. Greater detail than is shown here as to yield by years of maturity appears in both Durand and in *Banking and Monetary Statistics*.

The basic yield series represents the yield estimated as prevailing in the first quarter of each year on the highest-grade corporate issues, classified by term to maturity. This series is based on monthly high and low quotations of practically all the actively traded high-grade corporate issues outstanding since 1900. For further description, see *Banking and Monetary Statistics*, p. 430.

**N 201-202. Railroad bond yields, 1857-1936.** SOURCE: Macaulay, Frederick R., *Some Historical Problems Suggested by the Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, New York, 1938, pp. A 142-A 161.

**N 203-204. Yields of U. S. Government bonds and municipal high-grade bonds, 1919-1945.** SOURCES: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, table 128, p. 468; for 1942-1945, see *Federal Reserve Bulletin*, November 1945, p. 1133, and December 1946, p. 1383. For monthly figures and a description of these series see *Banking and Monetary Statistics*, pp. 429 and 468.

**N 205. Yields on preferred stocks, 1919-1945.** SOURCE: *Statistical Abstract of the United States*. For 1919-1926, see *Statistical Abstract* for 1937, table 322, p. 288; for 1927-1945, see *Statistical Abstract* for 1946, table 488, p. 447.

**N 206-211. Indexes of yields on common stocks, 1871-1937.** SOURCE: Cowles, Alfred, 3rd, and Associates, *Common Stock Indexes, 1871-1937*, Principia Press Inc., Bloomington, Ind., 1938, pp. 372-375 and 381. These are total actual dividends paid in each calendar year divided by total stock values as represented by an average of the monthly values for the year.

**N 212-214. Bond prices, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, table 130, p. 475; for 1942-1945, see *Federal Reserve Bulletin*, November 1945, p. 1134, and December 1946, p. 1384. For corporate medium and lower-grade and defaulted bonds, 1937-1945, see source volumes.

Prices shown are derived from average yields on basis of specified coupon rate and term to maturity which vary for different issues. They indicate the price movements of a representative bond of unchanging coupon and maturity. They do not measure accurately the average level of current price quotations in the market. For monthly figures and a description of the series, see *Banking and Monetary Statistics*, pp. 429-430 and 475.

**N 215-220. Index of common stock prices, 1871-1937.** SOURCE: Cowles, Alfred, 3rd, and Associates, *Common Stock Indexes, 1871-1937*, Principia Press Inc., Bloomington, Ind., 1938, pp. 66-75 and 131.

These indexes are presented in monthly figures in the source volume. The indexes are "spliced" to monthly averages of weekly *Standard Statistics* indexes which begin in 1918 or later, with the base 1926=100. The price relative for each issue in an index receives a weight equal to the product of the price per share by the number of shares outstanding. All necessary adjustments have been made in the number of shares outstanding. For an explanation of the construction of these indexes, see *Common Stock Indexes*, p. 17.

**N 221-227. Capital issues, by kind of issue and class of security, 1910-1945.** SOURCE: *Statistical Abstract of United States*. For 1910-1918, see *Statistical Abstract* for 1932, table 299, p. 292; for 1919-1945, see *Statistical Abstract* for 1947, table 495, p. 458. The primary source of these data is *The Commercial and Financial Chronicle*, New York City.

Data cover domestic and foreign issues in the United States. Preferred stock of no par value and all common stocks are taken at their offering price, other issues at par, except that in the figures for corporate issues for 1910 to 1918 all stocks are included at their market value. Corporate issues for 1910 to 1918 exclude real estate offerings and privileged stock subscriptions included in figures beginning 1919, and issues of less than \$100,000.

Other data on capital issues by kind of issue are available in the source volumes, e.g., total amount of new and refunding issues is distributed: "Corporate," "foreign government," "Farm loan and Government agencies," and "State and municipal."

**N 228-232. Volume of sales on New York Stock Exchange, 1900-1945.** SOURCE: For 1900-1909, see Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, table 135, p. 485; for 1910-1945, see *Statistical Abstract of United States* as follows: For 1910-1922, see *Statistical Abstract*, 1936, table 323, p. 289; for 1923-1945, see *Statistical Abstract*, 1947, table 485, p. 452. These data are published currently by *The Commercial and Financial Chronicle*, New York City. Data on stocks (N 228) cover ticker or "reported" volume which excludes odd-lots, stopped sales, private sales, split openings, crossed transactions, and errors of omission. Data on bonds are exclusive of stopped sales. Beginning in 1935 the Securities and Exchange Commission has compiled statistics on the volume and value of stock and bond sales on all registered exchanges. These are available by quarterly periods in the source volumes.

Series N 1-12.—ASSETS AND LIABILITIES—SECOND BANK OF THE UNITED STATES: 1817 TO 1840

[Figures are from *Annual Report of Comptroller of Currency, 1876*, p. lxxxiii, except in series N 12 where figures in parentheses (millions of dollars) are from *Annual Report, 1916*, p. 912]

YEAR	RESOURCES							LIABILITIES				
	Loans and discounts	Stocks	Real estate	Banking houses	Due from State and foreign banks	Notes of State banks	Specie	Capital	Circulation	Deposits	Due to State and foreign banks, etc. <sup>1</sup>	Other liabilities <sup>1</sup>

<sup>1</sup> Excludes reciprocal interbank demand balances with banks in the U. S., which at prior dates were reported "gross."  
<sup>2</sup> Number of nonnational banks estimated.

<sup>3</sup> For nonnational banks, all figures except number of banks and capital stock are estimated; see footnote 4, series N 35-42.

<sup>4</sup> Incomplete.

<sup>5</sup> Estimated figures based on number of banks in previous 5 years and resources and liabilities in 10 years, 1854 to 1863, inclusive.

## Series N 27-34.—ASSETS AND LIABILITIES—NATIONAL BANKS: 1863 TO 1945

[Amounts in thousands of dollars]

YEAR (June 30)	Number of banks	Total assets or liabilities (or total resources)	SELECTED ASSETS			SELECTED LIABILITIES

<sup>1</sup> Excludes reciprocal interbank demand balances with banks in the United States, which at prior dates were reported "gross".  
<sup>2</sup> Revised.  
<sup>3</sup> Revised. Source volume does not show adjustments for component series N 43-48.  
<sup>4</sup> Component series on number of banks (N 43-48) do not add to this figure; reason not clear.  
<sup>5</sup> Includes cash items.  
<sup>6</sup> Number of banks estimated.  
<sup>7</sup> All figures estimated except number of banks and capital stock, using as a basis the previous 10 years, 1854 to 1863, inclusive.

Series N 43-48.—ASSETS AND LIABILITIES—SAVINGS BANKS, STATE COMMERCIAL BANKS, AND PRIVATE BANKS: 1875 TO 1945

1870	1,612					55,811	42,559	9.9
1869 <sup>6</sup>	1,619					29,221	21,768	<sup>7</sup> 10.7

<sup>1</sup> Calendar year, 1919-1945; fiscal year ending June 30, 1907-1918; fiscal year ending August 31, 1869-1906.

<sup>2</sup> Number as of end of period.

<sup>3</sup> Not available prior to 1888.

<sup>4</sup> The figures of gross and net current earnings before 1927 include profits on securities sold; such profits during the second half of 1926, when first reported separately, were \$17,388,000. The figures of gross and net earnings up to and including the fiscal year ending June 1919 also includes recoveries on charged-off assets; such recoveries in the fiscal year ending June 30, 1919, were \$21,066,000.

<sup>5</sup> These figures differ from those shown in the source volume because, beginning in 1943, income taxes in the source volume are shown separately from other expenses and as a deduction from net current earnings. In this series income taxes have been treated as an expense throughout.

<sup>6</sup> 10 months only.

<sup>7</sup> Annual basis.

<sup>8</sup> 6 months only.

<sup>1</sup> Beginning in May 1942, 60 new reporting centers (affecting series N 76 and N 79) and a number of banks in previously included reporting centers (affecting all series) were added to those centers and banks included for the years prior to 1942. The figures for the period 1942-1945 are therefore not strictly comparable with those for the earlier years. The extent of the change in coverage is reflected for 1942 by comparing the figures shown above with those derived on the old basis, as follows: Series N 76, 607,071; series N 77, 210,961; series N 78, 342,430; series N 79, 53,679. (See *Federal Reserve Bulletin*, August 1943, p. 717.)

<sup>2</sup> Prior to 1936 the number of centers in this group varied considerably; from 1936-1941 the number was constant at 133; beginning with 1942 there have been 193 centers.

<sup>3</sup> Excludes interbank deposits and collection items.

<sup>4</sup> Partly estimated for first 4 months.

<sup>5</sup> Eleven months only; data for March 1933 not available because of bank holiday.

<sup>1</sup> For years prior to 1924 the figures are not for any uniform month. For 1924 and for 1927-1931 they are as of June; for 1925-1926 and for 1932-1945, as of December.<sup>2</sup> Mutual savings and private banks and their branches are excluded.<sup>3</sup> Figures represent loans and investments 1900-1936 and deposits 1937-1941;

neither loans nor investments nor deposit figures are available for 1934, 1940, and after 1941.

<sup>4</sup> Figures for 1942-1945 include "banking facilities" provided through arrangements made by the Treasury Department with banks designated as depositaries and financial agents of the Government.

<sup>1</sup> Includes industrial advances not shown separately.<sup>2</sup> Includes Federal Reserve notes held by the United States Treasury or by a Federal Reserve Bank other than the issuing bank.<sup>3</sup> Includes guaranteed obligations which were not issued until late in 1933. Reserve Banks were first authorized to purchase them in 1934.<sup>4</sup> Figures not comparable with later years in part because prior to June 21, 1917 member banks were not required to keep all of their legal reserves with the Reserve Banks; also from 1914-1916 deferred availability accounts, subsequently shown separately in the source, are included in total deposits.

<sup>1</sup> Current earnings less current expenses plus other additions and less other deductions.

<sup>2</sup> The Banking Act of 1933 eliminated the provision in the Federal Reserve Act requiring payments of a franchise tax.

<sup>3</sup> Payments made pursuant to Section 13b of the Federal Reserve Act.

<sup>4</sup> Figures for 1914 and 1915.

Series N 131-134.—FEDERAL RESERVE BANKS—MEMBER BANK RESERVE REQUIREMENTS: 1917 TO 1945

[Percent of deposits]

<sup>1</sup> For statement of redemption security, see text.

<sup>2</sup> Under the order of the Secretary of the Treasury of Dec. 28, 1933, as amended and supplemented on Jan. 11 and 15, 1934, all gold coin domestically owned (with minor exceptions) was required to be delivered for the account of the Treasurer of the United States, and under the Gold Reserve Act of 1934 (Jan. 30) withdrawn

from circulation and formed into bars. Gold coin (\$287,000,000) shown on Treasury records as being then outstanding was dropped from the monthly circulation statement as of Jan. 31, 1934.

<sup>3</sup> Total stock; circulation figures not available.

<sup>4</sup> Data for this series are available in source back to 1800. See text.

**Series N 166-171.—CURRENCY AND GOLD—CHANGES IN GOLD STOCK OF THE UNITED STATES: 1914 TO 1945**

[In millions of dollars. Gold valued at \$20.67 per fine ounce through January 1934; at \$35 thereafter]

<sup>1</sup> Includes demand deposits, other than interbank and United States Government, less cash items in process of collection.

<sup>2</sup> Beginning with Dec. 1938, includes United States Treasurer's time deposits, open account.

<sup>3</sup> Total time deposits include amounts held by commercial banks, mutual savings banks and the Postal Savings System. The figures exclude interbank time deposits and Postal Savings redeposited in banks. Time deposits at banks in possessions are excluded.

<sup>1</sup> Represents the lowest month and highest month, respectively, for given year.  
<sup>2</sup> Average yields on long-term, partially tax-exempt bonds.  
<sup>3</sup> Standard and Poor's Corporation.

<sup>4</sup> Standard and Poor's high-grade series. From 1919-1926 percentage is based on 20 issues, and from 1927-1945 on 15 issues, of non-callable public utility and industrial stocks.

## Chapter P. Government (Series P 1-277)

### Elections and Politics: Series P 1-61

#### PRESIDENTIAL ELECTIONS AND VETOES (P 1-39)

##### P 1-26. Methods of electing presidential electors, 1788-1836.

SOURCE: Paullin, Charles O., *Atlas of the Historical Geography of the United States*, Carnegie Institution of Washington and American Geographical Society of New York, 1932, p. 89. The electors, now elected by popular vote in all States, are selected, according to the Constitution, "in such manner as the legislature thereof may direct." The development of political-party direction of the electoral college was not anticipated in the Constitution, and during the early years of the republic, electors were chosen in the several States by a number of different devices. The principal devices were: Election by the State legislature itself in some States, by State electors popularly chosen to elect presidential electors, and by direct popular vote for the electors. With few exceptions, presidential electors have been elected by popular vote since 1828. The legislature of South Carolina, however, continued to elect presidential electors until 1860.

P 27-31. Electoral and popular vote for President, by political party, 1789-1944. SOURCE: The following references were employed individually and also in combination. Where sources differed, figures were selected by the Bureau of the Census staff. U. S. Congress, Clerk of the House of Representatives, *Platforms of the Two Great Political Parties, 1932 to 1944*, pp. 437-447; Pruffer, Julius F., and Folmesbee, Stanley J., *American Political Parties and Presidential Elections*, McKinley Publishing Company, Philadelphia, 1928; Paullin, Charles O., *Atlas of the Historical Geography of the United States*, Carnegie Institution of Washington and American Geographical Society of New York, 1932, pp. 88-104; Bureau of the Census, *Vote Cast in Presidential and Congressional Elections, 1928-1944*; U. S. Congress, Clerk of the House of Representatives, *Statistics of the Presidential and Congressional Elections*, issues for elections of 1928-1944.

The election of the President of the United States is provided for in the Constitution, article II, section 1, through the establishment of an electoral college in each State, for each Presidential election. The method of casting the electoral vote was modified in 1804 by the adoption of the 12th amendment to the Constitution. The number of electors, and therefore of electoral votes, is "equal to the whole number of Senators and Representatives to which the State may be entitled in Congress." Because of the varied practices in choosing electors in earlier years, the record of popular votes is inadequate to explain the elections until after 1824.

In four elections the entire electoral vote of certain States remained uncast: (1) 1872—The vote of Arkansas was rejected, the count of the popular vote in Louisiana was disputed, and the votes of both sets of electors were rejected by Congress; (2) 1868—No vote in Mississippi, Texas, and Virginia because these States had not been "readmitted" to the Union; (3) 1864—No vote in secession States: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North and South Carolina, Tennessee, Texas, and Virginia; (4) 1789—No New York electoral vote because the legislature failed to agree on electors. See also text of series P 50-56, below.

##### P 32-39. Number of Congressional bills vetoed, 1789-1946.

SOURCES: U. S. Congress, *Calendars of the United States House of Representatives and History of Legislation*, final edition, 79th Congress, pp. 96-98, 303-308; U. S. Congress, Senate Library, *Veto Messages . . . 1889-1944*; U. S. Congress, House of Representatives, *Report on Pocket Veto*, 70th Congress, 2d Session, Doc. No. 493;

U. S. Congress, *Veto Messages . . .*, 49th Congress, 2d Session, Miscellaneous Document No. 53.

The Constitution provides, article I, section 7, that no legislative bill may become law until approved by the President or, if disapproved and returned to the House of its origin, it is repassed in each House by a two-thirds vote. A bill may also become law if the President fails to return it to the House of its origin within 10 days (Sundays excepted) after it shall have been presented to him. If the Congress adjourns within the interval of 10 days, a bill disapproved by the executive does not become law and is said to be "pocket vetoed."

#### CONGRESSIONAL ACTIVITY AND PARTY AFFILIATIONS (P 40-56)

##### P 40-49. Congressional bills, acts, and resolutions, 1789-1946.

SOURCES: U. S. Congress, *Calendars of the United States House of Representatives and History of Legislation*, final edition, 79th Congress, pp. 303-309; also the following typewritten tabulations furnished by Library of Congress, Legislative Reference Service: "Number of Laws Enacted by Congress Since 1789 (Revised to Jan. 1947)"; "Total Number of Bills and Resolutions Introduced in Congress, 1st to 76th Congresses"; "Number of Laws Passed by Congress, 1933 (March 9)-1944 (through March 22)." Some measure of the activities of the United States Congress can be gained from the number of bills and resolutions which have been introduced in Congress and from the number of public and private laws which have been passed. The abrupt reduction in the number of private bills enacted into law beginning with the 60th Congress was the result of combining many private bills, particularly pension bills, into omnibus enactments.

P 50-56. Political party affiliations in Congress and the Presidency, 1789-1946. SOURCE: For 1st to 74th Congresses, typewritten tabulation from Library of Congress, Legislative Reference Service, "Political Trends—Both Houses of Congress—1789-1944," based on *Encyclopedia Americana*, 1936 ed., vol. 7, pp. 516-518 (1st to 69th Congresses), and Bruce, Harold R., *American Parties and Politics*, 3d ed., Henry Holt and Co., New York, 1936, pp. 174-179 (70th to 74th Congresses); for 75th to 79th Congresses, see *Congressional Directory*. For party affiliation of the President (series P 56), see U. S. Congress, Clerk of the House of Representatives, *Platforms of the Two Great Political Parties, 1932 to 1944*, pp. 435-436. It is generally recognized today that popular government operates only through the agency of organized political parties. During the early development of the United States, party alignments and the function of political parties were neither fully appreciated nor provided for. During the formative period party alignments developed, but designations for the different groups were not firmly fixed.

In the classification by party in series P 50-56, the titles of parties during early years have been so designated as to be recognizable in the records of the periods concerned and also to show the thread of continuity which tends to run from early alignments into the present two-party system. Inasmuch as the party of Thomas Jefferson (generally known at the time as the Republican party) has with a considerable measure of continuity survived to the present time as the Democratic party, the name later accepted by the Jeffersonian Republicans of "Democratic Republican" is used in the tables to avoid any confusion of the early Jeffersonian Republican with the present-day Republican party. Opposed to the early Republican party was the Federalist party which was dominant in the first national administration and which, with interruptions, can be traced tenuously by elements of popular sup-

port through the Whig, the National Republican, and the Free Soil parties to the Republican party of today.

Party affiliations of other than major-party presidential candidates are also shown in series P 29. If a minor, or a sectional party, has supported one of the major-party candidates, such support is indicated after that of the name of the principal nominating party. Minor-party candidates frequently have had several such endorsements, sometimes because similar groups in different sections of the country were known by different names.

#### APPORTIONMENT OF REPRESENTATIVES (P 57-61)

**P 57-61. Apportionment of Representatives among the States, 1790-1940.** SOURCE: Bureau of the Census, Sixteenth Census, 1940, *Population*, vol. I, p. 8, and records; *Congressional Directory*, 80th Congress, 1st Session, February 1947, pp. 237-241. The number of members in the House of Representatives was fixed by the Congress at the time of each apportionment; since 1912 it has remained constant. The 14th amendment to the Constitution, in effect at the present time, provides that "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." At the time of the 1940 apportionment, it was determined that there were no longer any Indians who should be classed as "not taxed" under apportionment law.

Prior to the passage of the 14th amendment, representatives were apportioned among the States "according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons." (Art. I, sec. 2.) The original assignment of Representatives, to be in effect until after the first enumeration of the population, and the requirement that each State have at least one Representative, are also included in the Constitution.

#### Government Civilian Employment: Series P 62-88

**P 62-64. Employees in the Executive Branch of the Federal Government, 1816, decennially 1821-1911, 1918, annually 1920-1945.** SOURCE: *Statistical Abstract*, 1946, table 219, p. 208, and Civil Service Commission records. The primary source is the Civil Service Commission, *Annual Reports*, and *Semi-annual and Monthly Reports of Employment*. These figures exclude military personnel, but include civilian employees of the Army and Navy. Excluded also are employees of the District of Columbia, and temporary substitute employees in the Post Office Department prior to 1941. Prior to 1938 the figures refer to employees on the rolls, with or without pay; from 1938-1942, they refer to the number on the pay roll with pay; since 1943, they refer to the number in active duty status.

**P 65-68. Civil Service classified competitive positions, persons examined, passed, and appointed, 1884-1945.** SOURCE: *Statistical Abstract*, 1946, table 220, p. 208. Data for 1918-1920 are from *57th Annual Report*, U. S. Civil Service Commission, 1940. The primary source is the Civil Service Commission, *Annual Report*, and records.

The United States Civil Service Commission was created by an act of Congress approved January 16, 1883. "The fundamental purpose of the law was to establish in the parts of the service covered by its provisions, a merit system whereby selection for appointment should be made upon the basis of demonstrated relative fitness without regard to religious or political considerations . . ." (*United States Government Manual*, 1947, p. 488.)

The term "classified service" was specifically defined by an act of Congress approved March 27, 1922, and quoted in the civil-service rules as section 1 of rule II, as follows:

"The classified service shall include all persons who have heretofore or may hereafter be given a competitive status in the classified civil service with or without competitive examination, by legislative enactment, or under the civil-service rules promulgated by

the President, or by Executive orders covering groups of employees with their positions into the competitive classified service, or authorizing the appointment of individuals to positions within such service. It shall include all positions now existing or hereafter created by legislative or executive action, of whatever function or designation, whether compensated by a fixed salary or otherwise, unless excepted from classification by specific affirmative legislation or executive action. No right of classification shall accrue to persons whose appointment or assignment to classified duties is in violation of the civil-service rules." (*57th Annual Report*, U. S. Civil Service Commission, 1940, pp. 43-44.)

**P 69-88. Number of public employees and monthly public pay rolls, 1929-1945.** SOURCE: Basic data are from records and various publications of the U. S. Civil Service Commission, Bureau of Labor Statistics, and Bureau of the Census, with adjustments and revisions. In particular, see Bureau of Labor Statistics, *Monthly Labor Review*, "Public Employment and Pay Rolls in the United States, 1929-39, . . ." February 1945; and Bureau of the Census, *Government Employment*, various issues, and *Statistical Abstract of the United States*, 1948, pp. 207 and 216.

The designations A and B in the column heads reflect two different approaches. Class A data, in each case, are from the Bureau of Labor Statistics and exclude nominal employees; that is, officials and employees who receive only nominal compensation for their services. Class B data, in each case, are from the Bureau of the Census and include all officials and employees who receive any compensation, however nominal, except school board members. The separate presentation of classes A and B is confined to group total series and to the local nonschool group series where the difference in classification is significant.

Basic studies in this field include the State, County, and Municipal Survey of the Bureau of Labor Statistics, conducted with funds provided by the Work Projects Administration, covering the period 1929-1939; the Bureau of the Census quarterly survey of government employment which began in 1940; and the Biennial Survey of Education conducted by the Office of Education, Federal Security Agency.

Other studies on government employment are of limited value for historical comparisons, either because of their one-time nature, limited coverage, or differing definitions. Estimates of employment and pay rolls for the years 1909-1927 may be found in King, Wilford I., *The National Income and Its Purchasing Power*, National Bureau of Economic Research, 1930, pp. 360-365.

For the year 1926, William E. Mosher and Sophie Polah made a careful study of public employment and pay rolls based on approximately 500 reports from State and local governments, and published the results in "Public Employment in the United States," supplement to *National Municipal Review*, vol. XXI, No. 1, January 1932.

The Bureau of Foreign and Domestic Commerce published public employment data in connection with its national income studies, in its *National Income, 1929-1932*, 73d Congress, 2d Session, Senate Document No. 124, Washington, 1934. In its June 1941 issue of *Survey of Current Business*, p. 18, are presented revised estimates of total salaries and wages of government employees, 1929-1940. These estimates have been revised since publication of the Bureau of Labor Statistics and Census surveys.

Relying heavily on the Mosher-Polah and Bureau of Foreign and Domestic Commerce studies, Simon Kuznets in *National Income and Its Composition, 1919-1938*, National Bureau of Economic Research, 1941, vol. II, pp. 811-826, published revised estimates of Government employees and pay rolls for the years 1919-1938.

##### TREASURY RECEIPTS, EXPENDITURES, AND SURPLUS OR DEFICIT (P 89-108)

**P 89-96. Treasury receipts, 1789-1945.** SOURCE: See listings of individual series, below:

**P 89-93. Treasury receipts: Total, customs, internal revenue,**

**total other, 1789-1945.** SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, table 2, pp. 366-371, 419-423. Data were compiled on the basis of warrants issued from 1789 to 1915, and on the basis of daily Treasury statements for 1916 and subsequent years. General, special, emergency, and trust accounts are combined from 1789 through 1930. Trust accounts are excluded for 1931 and subsequent years.

**P 94-96. Treasury receipts: Sales of public lands, surplus postal receipts, and miscellaneous receipts.** SOURCE: *Annual Report of the Treasury, 1946*, as follows: For series P 94, see table 14, pp. 422-423; for series P 95, see table 13, pp. 419-421. For P 96, data for 1789-1939 are from *Annual Report, 1940*, table 6, pp. 642-645; data for 1940-1945 were obtained by subtracting the sum of series P 94-95 from series P 93. For series P 94, data are on basis of warrants issued from 1789 to 1930 and on the basis of checks issued for 1931 and subsequent years. For basis of other series, see text for series P 89-93.

**P 97-98. Treasury surplus or deficit, 1789-1945.** SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, table 2, pp. 367-371.

**P 99-108. Treasury expenditures, 1789-1945.** SOURCE: See listings for individual series, below.

**P 99-103. Treasury expenditures: Total (excluding debt retirements), War, Navy, interest, and total of "other expenditures," 1789-1945.** SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, table 2, pp. 366-371. Data were compiled on the basis of warrants issued from 1789 to 1915, and on the basis of daily Treasury statements for 1916 and subsequent years. General, special, emergency, and trust accounts are combined from 1789 through 1930. Trust accounts are excluded for 1931 and subsequent years.

**P 104-107. Treasury expenditures: Indians, veterans' pensions, postal deficiencies, civil and miscellaneous, 1789-1945.** SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, as follows: For series P 104-105, see table 14, pp. 422-423; for series P 106, see table 13, pp. 419-421. For series P 107, data for 1789-1931 are from *Annual Report of the Secretary of the Treasury, 1940*, table 6, pp. 646-649; data for 1932-1945 were obtained by subtracting the sum of series P 104-106 from series P 103. For series P 104-105, data are on basis of warrants issued from 1789 to 1930 and on the basis of checks issued for 1931 and subsequent years. For series P 106, data are on basis of warrants issued prior to 1922, and on basis of daily Treasury statements for 1922 and thereafter. For basis of series P 107, see text for series P 99-103.

**P 108. Treasury expenditures: Statutory debt retirements, 1918-1945.** SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, table 2, pp. 369-371.

#### INTERNAL REVENUE COLLECTIONS (P 109-131)

**P 109-131. Internal revenue collections by tax sources, 1863-1945.** SOURCES: For 1863-1915, see *Annual Report of the Secretary of the Treasury, 1929*, table 10, pp. 419-424; for 1916-1945, see *Annual Report, 1946*, table 9, pp. 406-409.

**P 109-119. Internal revenue collections: Total and selected sources, 1863-1945.** SOURCES: See text for series P 109-131, above.

**P 120-131. Internal revenue collections: Income, excess profits, capital stock, gift taxes, etc., 1863-1945.** SOURCES: See text for series P 109-131, above.

#### PUBLIC DEBT (P 132-143)

**P 132-136. Principal of public debt outstanding, 1791-1945.** SOURCE: For 1791-1852, see *Annual Report of the Secretary of the Treasury, 1891*; for 1853-1945, see *Annual Report . . . 1946*, pp. 455-456. Data are on the basis of public debt accounts from 1791 through 1919. More specifically, the figures for 1853 through 1885 are taken from "Statement of receipts and expenditures of the Government from 1855 to 1885 and principal of public debt from 1791 to 1885" compiled from the official records of the Register's office. From 1886 through 1919, figures are taken from the monthly

debt statements and revised figures published in the annual reports of the Secretary of the Treasury. From 1920 to 1945, figures are taken from the Preliminary Statement of the Public Debt published in the daily Treasury statements.

**P 137-138. Computed annual interest charge and rate of interest, 1855-1945.** SOURCE: For 1856-1891, see *Annual Report of the Secretary of the Treasury, 1891*, table C, p. xciv; for 1855, 1892-1915, see *Statistical Abstract of the United States, 1921*, p. 829; for 1916-1945, see *Annual Report of the Secretary of the Treasury . . . 1946*, table 58, p. 546. Data are on basis of public debt accounts from 1855 through 1942 and on basis of daily Treasury statements for 1943 to 1945.

**P 139-143. Composition of interest-bearing debt, 1880-1945.** SOURCE: For 1880-1915, data are from records of the Treasury Department; for 1916-1945, see *Annual Report of the Secretary of the Treasury . . . 1946*, table 26, p. 459. Data are on basis of public debt accounts from 1880 through 1919 and on basis of daily Treasury statements from 1920 to 1945.

#### INCOME TAX RETURNS (P 144-164)

**P 144-164. Income tax returns, 1913-1945.** SOURCE: See listings for individual series, below.

**P 144-151. Income tax returns: Individual, estate, and trust, 1913-1945.** SOURCE: For 1913-1942, see *Statistical Abstract, 1946*, table 346, p. 321; for 1943, see *Statistical Abstract, 1947*, table 349, p. 325; for 1944-1945, data were obtained from records of the Bureau of Internal Revenue. Original source of the data appearing in the *Statistical Abstract* is the Treasury Department, Bureau of Internal Revenue, *Statistics of Income*, part 1.

Under revenue laws, individuals are required to file returns as follows: (1) Single or married, for 1913-1916, those with net income of \$3,000 or over; (2) single, or married and not living with husband or wife, for 1917-1924, \$1,000 or over; 1925-1931, \$1,500 or over; 1932-1939, \$1,000 or over; for 1940, those with gross income of \$800 or over; for 1941, \$750 or over; and for 1942 and 1943, \$500 or over regardless of amount of net income; (3) married and living with husband or wife, filing a *joint return*, for 1917-1923, those with net income of \$2,000 or over; 1924, \$2,500 or over; 1925-1931, \$3,500 or over; 1932-1939, \$2,500 or over; for 1940, those with gross income of \$2,000 or over; for 1941, \$1,500 or over; for 1942, \$1,200 or over; and for 1943, if gross income exceeds \$624, regardless of amount of net income; also for 1943, a return is required of any person liable for tax for 1942, regardless of amount of gross income for 1943; (4) every individual with gross income of \$5,000 or over for 1921-1939, and as stated above for 1940-1943. For 1944 and 1945, every citizen or resident having gross income of \$500 or more is required to file a return. For refund purposes, returns are also required with respect to gross income under \$500 from which taxes have been withheld. *Data for returns showing no net income, filed in accordance with these latter provisions, are not included in statistics shown.* Fiduciaries are required to file returns on the same basis as single individuals, except that a return is required for every estate or trust of which any beneficiary is a non-resident alien, and for 1938-1945, a return is required for every trust having a net income of \$100 or over. Partnership net profit or net loss is reported on individual returns of co-partners according to their shares.

**P 152-164. Income tax returns, corporation, 1909-1945.** SOURCES: U. S. Treasury Department, Bureau of Internal Revenue, *Statistics of Income, 1943*, part 2, table 15, p. 340, and records; series P 164 is series P 152 minus the sum of series P 153 and P 160, see *Statistical Abstract, 1946*, table 354, p. 329.

Under the Revenue Act of 1934, the privilege of filing a consolidated return for a group of affiliated corporations was limited to common carriers by railroad and their related leasing and holding companies. The Revenue Act of 1936 extended this privilege to

street, suburban, and interurban electric railway corporations. These changes resulted in marked differences between returns for 1934-1941, and those for 1933 and prior years, in net-income or deficit classification and in size of total assets, as well as in distribution by industries. Tables showing effect on tabulated data of discontinuance of consolidated returns except by railroad corporations appear in *Statistics of Income for 1934*, part 2. Beginning in 1942, the consolidated-return privilege was again extended, in general, to all corporations.

Gross income (series P 154 and P 161) is obtained from "Total income" as reported on the return by adding "Cost of goods sold," "Cost of operations" (beginning 1932), and any negative items reported under sources of income. In 1918-1924, railroad and other public utility corporations frequently reported only the net amount of income, resulting in estimated understatements of \$5 billion in 1918 and 1919 and nearly twice that amount in 1920 and 1921; there are no estimates of understatement for 1922-1924. The gross income figures for 1918-1921 exclude the bulk of dividends received.

For 1922-1933 and 1940-1945, net income (series P 155) is the amount before deduction due to net operating loss of prior year. (Net operating loss was not allowable as a deduction for years other than those specified.) For 1935 and prior years, net income or deficit (series P 162) is the amount reported for income tax computation; for 1936 and later years it is the amount reported for (declared value) excess-profits tax computation, except that, for 1944 and 1945, the amount shown includes government interest subject to surtax only and continues to include the excess of net long-term capital gain over net short-term capital loss, even though such excess was made exempt from declared value excess profits beginning in 1944. Beginning in 1936, contributions or gifts are deductible in arriving at net income.

Income tax (series P 157) for 1905-1915 consists of tax collections; for 1916-1945, it is the amounts of tax liabilities reported on the returns before deduction of credit for taxes paid to foreign countries or United States possessions.

#### POSTAL RECEIPTS AND EXPENDITURES (P 165-169)

P 165-169. Postal receipts and expenditures, 1789-1945. SOURCE: *Annual Report of the Secretary of the Treasury, 1946*, table 13, pp. 419-421.

#### COPYRIGHTS, PATENTS, AND TRADEMARKS (P 170-187)

P 170-174. Copyright registrations, 1898-1945. SOURCE: *Annual Reports of the Register of Copyrights* (Library of Congress). Data are for fiscal years ending June 30.

P 175. Copyright registrations of commercial prints and labels, 1874-1945. SOURCE: For 1874-1925, see *Annual Report of the Commissioner of Patents*; for 1926-June 30, 1940, see Patent Office records; for July 1, 1940-1945, see Library of Congress records. Data for fiscal years beginning in 1940 are published in the *Annual Report of the Library of Congress*.

P 176-180. Patents granted, 1790-1945. SOURCE: For series P 176-179, see *Annual Report of the Commissioner of Patents* and the numbers given to patents, which are numbered consecutively; for series P 180, same as series P 181-184 below. Patents are classified by inventions (series P 177), designs (series P 178) for articles of manufacture, and reissues (series P 179) which are new patents granted to replace those already granted in order to make some amendment or correction. Design patents were first authorized by Congress in 1842. The Patent Act of July 4, 1836, made radical changes in the patent law, and the present numbering series starts with this date. Reissues are included in series P 176 in 1837 and the immediately preceding years, but they are very few in number. See also Department of Commerce, *The Story of the American Patent System, 1790-1940*, for a historical narration of the development of patent laws.

P 181-184. Applications for patents filed, 1840-1945. SOURCE: For 1790-1925, see *Annual Report of the Commissioner of Patents*; for 1926-1945, see Patent Office records.

P 185-187. Trade-marks registered, 1870-1945. SOURCE: *Annual Report of the Commissioner of Patents and Patent Office records*. The sudden increase in registrations in 1920 is connected with a new law passed in March of that year facilitating registrations. The basic trade-mark law was enacted in 1905. Prior laws, passed in 1870 and 1881 were limited in scope, with the earlier one being held unconstitutional. Registrations are for 20 years with renewals for 20-year periods.

### State and Local Government Finances: Series P 188-277

P 188-277. General note. For almost a century, the United States Government has published information regarding the finances of State and local governments. Beginning in 1850, surveys approximately every 10 years have reported selected financial aspects of all State and local governments. For 1870 through 1922, these data were published under the title *Wealth, Debt, and Taxation* or variations thereof; for 1932 the data were published in *Financial Statistics of State and Local Governments*; and for 1942 they are found in *Census of Governments*. For a historical resume of "Ten Decennial Censuses of Governments: 1850-1942," see Bureau of the Census, *Governmental Finances in the United States: 1942*, pp. 130-135; of the three type-of-government reports now issued annually, the city series was initiated in 1898, the State series was started in 1915, and the county series was begun in 1942.

*Comparability of data:* The first four decennial censuses are too diverse and different in content from present surveys to permit more than limited comparison with recent years. Their emphasis was upon tax levies, debt, and wealth, the last census of wealth having been taken in 1922. Starting with the 1890 decennial census, a more balanced reporting of revenue, expenditure, and debt has characterized decennial and later annual reporting. Throughout nearly six decades, revenue was reported by source, expenditure by function and character, and debt by gross and net liabilities. Definitions of these terms, however, have been so revised as to prevent identity among classifications for all years, but the revisions do not vitiate approximate similarity in totals and major financial classes.

Historically, Census reporting on State and local finance has involved varying treatment of three categories—general government, enterprises, and continuing reserve funds (sinking and trust funds). Until 1937 they were merged into a consolidated set of statistics. Thereafter, government enterprises were constituted as a separate category, thereby excluding gross earnings and expenditures of public utilities and other enterprises from the general government statistics showing tax and other revenue and expenditure for schools, roads, welfare, and other functions of general benefit. Of course, net contributions to general government from enterprise earnings are shown as a general revenue; and any net contribution from tax and other general revenue for enterprise purposes is treated as a general expenditure. In 1941, sinking and trust funds were constituted as a separate category; earnings of these funds were eliminated from general revenue and disbursements by trust funds were deleted from general expenditure. The substantial general contributions to sinking funds for debt retirement and to pension and unemployment compensation funds for social insurance are shown as general expenditure, together with smaller transfers for other purposes.

The definition as to what constitutes an independent unit of government—and hence a unit for separate reporting—has changed over the decades. Of the various decennial censuses of governments, only the 1942 census included in the township classification all townships and New England towns. Earlier censuses included part of the urban townships or New England towns with cities. Earlier censuses also tended to include with special districts, groups of dependent districts of counties. The line between independent and dependent school districts has not been the same in

all decennial censuses; but it has been sufficiently similar to permit rough comparisons among years.

*Adjustments to approach comparability.\** Data used here for years before 1937 and 1941 have been recast to render them comparable, as far as feasible, with information shown for these and later years. The largest enterprise transactions, revenue and operation expenditure, are uniformly excluded. Enterprise statistics for capital outlay and interest on debt are deleted for States and for cities having populations over 30,000. Enterprise amounts remaining are not significant.

Adjustments in data for years before 1941, in order to separate reporting of sinking and trust funds, have been feasible for governmental units involving the bulk of funds of this type. Thus, in lieu of benefit payments for pensions and unemployment compensation, general-government contributions to reserve funds for these purposes are shown for States and for large cities. Likewise, pension assessments and earnings of sinking and trust funds are excluded as general revenue of States and large cities and are recognized as receipts of the reserve funds. Since these two types of units account for the preponderant share of State and local sinking and trust funds, the mentioned adjustments cover most of the transactions of this nature.

Related to the establishment of the category of sinking and trust funds is the addition in 1941 of provision for debt retirement as an expenditure class. The first element of this class consists of general contributions to sinking funds for the immediate or later retirement of debt, and the second is direct debt redemption—i. e., redemption directly from general funds, not from sinking funds. Provision for debt retirement can be shown only for the years beginning with 1941.

The most important remaining type of adjustment which has been made relates to intergovernmental aid. Since 1941, fiscal aid in Census reporting has comprised both functional grants and State-imposed taxes shared with local governments. Local shares of State taxes had been classified as local tax revenue prior to that time. Using the United States Senate report, *Federal, State, and Local Fiscal Relations*, Senate Document No. 69, 78th Congress, 1st Session, pre-1941 financial data have been adjusted in these series to report local shares of State-imposed taxes as State revenue, as State expenditure for fiscal aid, and as local revenue from fiscal aid.

The development of Census reporting on State and local finances summarized above is described in detail in a *Historical Review of State and Local Finances* (see text for series P 188-233 for a more complete citation). This last publication brings together data for considerable historical periods adjusted to achieve comparability with current reporting of State and local finances. Detailed definitions of the terms used here may also be found there and in the Census Bureau annual reports on State, city, and county finances.

**P 188-223. General revenue by source, general expenditure by character and function, and gross debt, selected years, 1890-1945.** SOURCE: Bureau of the Census, *Historical Review of State and Local Government Finances*, comprising State and Local Government Special Study No. 25, June 1948. Since series P 188-211 do not separately show townships, school districts, and special districts, series P 212-215 are presented to summarize the trends for these types of government.

Direct summation of State and local revenue and expenditure into aggregates would result in the double counting of intergovernmental aid paid between State and local governments. The large amount of aid paid by States to local government, as well as the very small amount of aid paid by localities to States, would be

counted both as State and as local transactions. To avoid this double counting, totals in series P 188-201 show State and local revenue and expenditure on a net basis, excluding duplicating aid. Series P 216-223 show the actual amounts involved in the exclusion of duplicating aid from totals in series P 188-201.

City statistics in series P 188-223 cover all cities rather than only the cities having populations over 100,000, shown in series P 250-277. School districts refer to districts independent of cities and counties and hence do not include the schools financed as dependent parts of cities and counties.

Underlying public financing, especially of local governments, is the size of the assessed valuation of taxable property and of property tax levies. Data are shown in text table 1 for selected years from 1850 to 1940.

TABLE 1.—ASSESSED VALUATION AND PROPERTY TAX LEVIES OF STATE AND LOCAL GOVERNMENTS: SELECTED YEARS 1850 TO 1940

[ In millions ]

YEAR	Assessed valuation	PROPERTY TAX LEVY	
		State government	Local government
1940	\$143,282	\$255	<sup>1</sup> \$4,322
1932	168,317	359	4,668
1922	124,617	354	3,149
1912	69,458	155	1,185
1902	35,338	80	645
1890	25,478	71	400
1880	17,140	52	262
1870	<sup>2</sup> 11,406	55	171
1860	12,085	( <sup>3</sup> )	<sup>4</sup> 94
1850	<sup>5</sup> 7,186	( <sup>3</sup> )	( <sup>5</sup> )

<sup>1</sup> Property tax collections for 1942.

<sup>2</sup> Gold basis.

<sup>3</sup> State levies included with local levies; segregation not available.

<sup>4</sup> Estimated full valuation.

<sup>5</sup> Data not available.

**P 235-249. State tax collections, 1915, 1919, 1922-1945.** SOURCES: Bureau of the Census, *Historical Review of State and Local Government Finances*, comprising State and Local Government Special Study No. 25, June 1948.

**P 250-277. Financial summary and general expenditure by function of cities having population over 100,000, selected years 1902-1945.** SOURCE: Bureau of the Census, *Historical Review of State and Local Government Finances*, comprising State and Local Government Special Study No. 25, June 1948. Beginning in 1941 (with data available also for 1940), the term *city* has been defined as the *city corporation*. This is the political unit organized under the law as an entity accountable to the electorate; and hence the term excludes all overlying local governments even though they may perform functions that some city corporations render. Prior to 1941, the term *city* was essentially an area concept in that the Census Bureau reported not only city corporations but also computed portions of overlying local governments. The finances of overlying school and other special districts were prorated according to the ratio of the part of the assessed valuation of the overlying unit within the city area to the total valuation of the overlying unit. County finances were prorated only for counties overlying cities having populations over 300,000.

Series P 1-26.—METHODS OF ELECTING PRESIDENTIAL ELECTORS: 1788 TO 1836

[L—by legislature; G T—by people, on general ticket; D—by people, in districts; A—by people, in the State at large; E—by electors. The number in parentheses following the symbol "D" is the number of districts into which the State was divided. As a rule, each district elected 1 elector. The number in parentheses following the symbol "A" is the number of electors elected at large]

<sup>1</sup> A majority of the popular vote was necessary for a choice. In case of a failure to elect, the legislature supplied the deficiency.  
<sup>2</sup> A majority of votes was necessary for a choice. In case of a failure to elect 1 or more electors a second election was held by the people, at which choice was made from the candidates in the first election who had the most votes. The number of candidates in the second election was limited to twice the number of electors wanted.  
<sup>3</sup> Each of the 8 districts chose 2 electors, from which the General Court (i. e., the legislature) selected 1. It also elected 2 electors at large.  
<sup>4</sup> 2 of the districts voted for 5 members each, and 2 for 3 members each. A majority of votes was necessary for a choice. In case of a failure to elect by popular vote the General Court supplied the deficiency. In the election of 1792 the people chose 5 electors and the General Court 11.  
<sup>5</sup> A majority of votes was necessary for a popular choice. Deficiencies were filled by the General Court, as in 1792. It also chose 2 electors at large. In 1796 it chose 9 electors, and the people, 7.  
<sup>6</sup> 1 district chose 6 electors; 1, 5 electors; 1, 4 electors; 2, 3 electors each; and 1, 1 elector.

<sup>7</sup> 1 district elected 3 electors; 2, 2 electors each; and 27, 1 elector each. The 3 electors thus elected chose 2 presidential electors.  
<sup>8</sup> Each qualified voter voted for 1 elector. The 3 electors who received most votes in the State were elected.  
<sup>9</sup> During the years 1804-1823 Maryland chose 11 electors in 9 districts, 2 of the districts elected 2 members each.  
<sup>10</sup> 1 district chose 4 electors; 1, 3 electors; 1, 2 electors; and 1, 1 elector.  
<sup>11</sup> The State was divided into 4 districts, and the members of the legislature residing in each district chose 3 electors.  
<sup>12</sup> Each district elected 4 electors.  
<sup>13</sup> 2 districts chose 5 electors each, and 1 chose 4 electors.  
<sup>14</sup> In 1796 and 1800 Tennessee chose 3 presidential electors—1 each for the districts of Washington, Hamilton, and Mero. 3 "electors" for each county in the State were appointed by the legislature, and the "electors" residing in each of the 3 districts chose 1 of the 3 presidential electors.

Series P 27-31.—ELECTIONS AND POLITICS—ELECTORAL AND POPULAR VOTE FOR PRESIDENT, BY POLITICAL PARTY: 1789 TO 1944

Not all minor candidates included; hence sum of votes cast for listed candidates may not equal total votes cast in election. More than one party designation may follow a candidate's name because of his endorsement by minor parties (listed second) or because several minor groups known by various names in different States may support the same candidate.]

							Benjamin Lin- coln. Edward Telfair (Not voted)		2 1 1 12		

<sup>1</sup> Includes 798 Union votes cast in endorsement of Republican candidates.  
<sup>2</sup> Because of the death of Horace Greeley, Democratic electors scattered their votes.  
<sup>3</sup> Harrison, 549,000; White, 146,000; and Webster, 41,000.  
<sup>4</sup> For 1832, see *Platforms of the Two Great Political Parties*, p. 440. However, *Atlas of the Historical Geography* . . . gives Jackson, 707,000; Clay, 329,000; Wirt, 255,000. *American Political Parties and Presidential Elections* gives 530,189 for Clay but indicates this includes votes for Wirt.

<sup>5</sup> No candidate having a majority in the electoral college, the election was decided in the House of Representatives.  
<sup>6</sup> Prior to the election of 1804, each elector voted for 2 candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President, the next highest, Vice-President. This provision was modified by adoption of the 12th amendment which was proposed by the 8th Congress, Dec. 12, 1803, and declared ratified by the legislatures of three-fourths of the States in a proclamation of the Secretary of State, Sept. 25, 1804.

<sup>1</sup> Excludes the population of the District of Columbia, the population of the territories, the number of Indians not taxed, and (prior to 1870) two-fifths of the slave population.  
<sup>2</sup> This number is the actual number apportioned at the beginning of the decade.  
<sup>3</sup> No apportionment was made after the census of 1920.

<sup>4</sup> Amended by the act of May 30, 1872.  
<sup>5</sup> Amended by the act of March 4, 1862.  
<sup>6</sup> Amended by the act of July 30, 1852.  
<sup>7</sup> The minimum ratio of population to representatives stated in the Constitution (art. 1, sec. 2).

Series P 62-68.—GOVERNMENT EMPLOYMENT—FEDERAL GOVERNMENT EMPLOYMENT: 1816 TO 1945

[ For series P 65-68, data are for fiscal year from July 1 to June 30, except as indicated. For series P 65-67, data are not available for 1942-1945 ]

<sup>1</sup> Approximate prior to 1921. For the period 1905-1910, data (not shown above due to lack of space) for series P 63 and P 64 are as follows: P 63—1905, 25,930; 1906, 26,399; 1907, 27,284; 1908, 29,161; 1909, 30,298; 1910, 33,057. P 64—1905, 274,685; 1906, 300,456; 1907, 310,467; 1908, 322,943; 1909, 337,496; 1910, 351,031.  
<sup>2</sup> Figures for years prior to fiscal year ending June 30, 1934, are approximate.  
<sup>3</sup> Includes war-service appointments, temporary, etc.  
<sup>4</sup> Includes approximately 3,000 employees serving without compensation (W.O.C.) and \$1-a-year employees.  
<sup>5</sup> Excludes 68 employees occupying classified positions in the Administrative Office of the U. S. Courts.

<sup>6</sup> As of July 31  
<sup>7</sup> Estimated.  
<sup>8</sup> As of June 30.  
<sup>9</sup> As of Nov. 11.  
<sup>10</sup> January 16, 1886, to June 30, 1887.  
<sup>11</sup> January 16, 1885, to January 15, 1886.  
<sup>12</sup> January 16, 1884, to January 15, 1885.  
<sup>13</sup> July 16, 1883, to January 15, 1884.

Series P 69-88.—GOVERNMENT EMPLOYMENT—EMPLOYMENT AND PAY ROLLS: 1929 TO 1945

Employment figures represent average monthly employment and pay-roll amounts represent average monthly pay rolls, during year. Because of rounding, detail may not add to totals. Figures on nominal employees not available for years prior to 1940 ]

<sup>1</sup> From 1789 to 1842 the fiscal year ended Dec. 31; from 1844 to date, on June 30. Figures for 1843 are for a half year, Jan. 1 to June 30.

<sup>2</sup> Total receipts are exclusive of net receipts under Title VIII of the Social Security Act. Amounts representing appropriations equal to "Social Security taxes—Federal Insurance Contributions Act" collected and deposited under Sec. 201 (a) of the Social Security Act Amendments of 1939, less reimbursements to the General Fund for administrative expenses, are deducted on the daily Treasury statement from total receipts. Such amounts are reflected under trust account receipts as net appropriations to the Federal old-age and survivors insurance trust fund.

<sup>3</sup> Beginning with the fiscal year 1932, tonnage tax has been covered into the Treasury as miscellaneous receipts.

<sup>4</sup> Comprises railroad unemployment insurance contributions, proceeds of government-owned securities, Panama Canal tolls, etc., proceeds from sales of surplus property (Act. Oct. 3, 1944), seigniorage, and other miscellaneous.

<sup>5</sup> Includes deposits resulting from the renegotiation of war contracts. Information regarding the amount of such deposits is not available on the basis of daily Treasury statements. On the basis of covering warrants such deposits totaled \$558,223,780.23 for 1943, \$2,235,333,011.57 for 1944, and \$2,040,925,653.37 for 1945. The foregoing coverings include so-called voluntary returns.

Series P 99-108.—FEDERAL GOVERNMENT FINANCES—TREASURY EXPENDITURES: 1789 TO 1945

[ Figures are rounded to nearest dollar and will not necessarily add to totals ]

<sup>1</sup> From 1789 to 1842 the fiscal year ended Dec. 31 from 1844 to date, on June 30. Figures for 1843 are for a half year, Jan. 1 to June 30.

<sup>2</sup> Excludes civil expenditures under War and Navy Departments in Washington, and to and including fiscal year 1915. Additional expenditures for "War activities" are reflected in the total for "Other expenditures."

<sup>3</sup> Includes civil expenditures under War and Navy Departments in Washington, and including fiscal year 1915, and unavailable funds charged off under act of June 3, 1922 (42 Stat. 1592).

<sup>4</sup> Represents advances from the General Fund of the Treasury to the Postmaster General to meet deficiencies in postal revenues. These figures do not include any allowances for offsets on account of extraordinary expenditures or the cost of free mailings contributing to the deficiency of postal revenues certified to the Secretary of the Treasury by the Postmaster General pursuant to the act of Congress approved June 9, 1930. Excludes amounts transferred to the civil retirement and disability fund under act of May 22, 1920 (41 Stat. 614), and amendments thereto on account of salary deductions of 2½ percent, as follows: 1921,

\$6,519,633.59; 1922, \$7,899,006.28; 1923, \$3,284,081.00; 1924, \$3,679,658.60; 1925, \$10,266,977.00; and 1926, \$10,472,289.59.

<sup>5</sup> Excludes interest accounts which are included in trust fund expenditures.

<sup>6</sup> Repayment of unexpended portion of prior years' advances.

<sup>7</sup> Exclusive of General Fund payments from the appropriation "Additional compensation, Postal Service" under authority of the act approved Nov. 3, 1919, in the amounts of \$35,698,400, \$1,374,015, and \$6,700 for the fiscal years 1920, 1921, and 1922, respectively.

<sup>8</sup> Receipts and public debt retirements for 1921 exclude \$4,342,066.45 written off the public debt Dec. 31, 1920.

<sup>9</sup> Actual advances from General Fund were reduced by repayment of \$5,800,000 from prior year advances which was carried to surplus.

Series P 109-119.—FEDERAL GOVERNMENT FINANCES—INTERNAL REVENUE COLLECTIONS, TOTAL AND SELECTED TAX SOURCES: 1863 TO 1945

[ Since tax sources shown are on a selected basis, they do not add to total. Figures for 1935 and subsequent years exclude trust fund receipts ]

YEAR	Total internal revenue collections <sup>1</sup>	SELECTED TAX SOURCES									
		Liquor taxes			Total stamp taxes (including playing cards) <sup>2</sup>	Tobacco manufactures, including special taxes in effect to June 30, 1926 <sup>3</sup>	Manufactures, etc., excise <sup>4</sup>	Oleomargarine, including special taxes <sup>5</sup>	Telegraph, telephone, cable and radio facilities, etc.	Transportation, including oil by pipeline <sup>6</sup>	Admissions
		Total	Distilled spirits and wines, including special taxes <sup>7</sup>	Fermented malt liquors, including special taxes <sup>8</sup>

<sup>1</sup> Includes income tax on Alaska Railways except in fiscal years 1935, 1936, and 1937, during which time these receipts were considered trust fund receipts.

<sup>2</sup> Including special taxes relating to manufacture and sale.

<sup>3</sup> Stamps and playing cards have been combined. Stamps include receipts as follows: (a) Sales by post-masters of documentary stamps for 1918, \$4,336,182.21; 1919, \$10,199,466.51; 1920, \$24,437,893.75; 1921, \$20,380,868.86; 1922, \$14,616,958.05; 1923, \$11,843,403.64; 1924, \$12,413,180.23; 1925, \$7,737,895.47; 1926, \$7,880,707.04; 1927, \$35,417.33; 1928, \$2,000; and 1929, \$233,306.96. (b) Excise tax on perfumes, cosmetics, and medicinal articles for 1922 amounting to \$2,305,482.25.

<sup>4</sup> Includes taxes on sales under act of Oct. 22, 1914, manufacturers, consumers, and dealers' excise taxes under the war revenue and subsequent acts, except soft drink taxes; all taxes paid by manufacturers of and dealers in adulterated and processed or renovated butter, mixed flour, and filled cheese; and for 1932-45, manufacturers' excise taxes (act of 1932, as amended) except soft drinks. Includes receipts from the tax on raw cotton as follows: Fiscal year 1863, \$351,311.43; 1864, \$1,268,412.56; 1865, \$1,772,983.48; 1866, \$18,409,654.90; 1867, \$23,769,073.80; and 1868, \$22,500,947.77.

<sup>5</sup> Includes tax on transportation of persons beginning in 1942, and tax on transportation of property beginning in 1943 (levied Dec. 1, 1942).

<sup>6</sup> Included under stamp taxes.

<sup>1</sup> Separate figures on corporation and individual income and excess profits tax collections not available for the years 1918 to 1924.

<sup>2</sup> Includes income tax on Alaska Railway except in fiscal years 1935, 1936, and 1937, during which time these receipts were considered trust fund receipts. Also includes receipts from excise tax on corporations as follows: Fiscal year 1910, \$20,959,783.74; 1911, \$33,511,525; 1912, \$28,583,259.81; 1913, \$35,006,299.84;

and 1914, \$10,671,077.22; munitions manufacturers' tax for 1917, \$27,663,939.63; and 1918, \$18,296,927.32; also corporation income tax for 1925, \$916,232,697 (separate figures for earlier years not available); 1926, \$1,094,979,734; 1927, \$1,308,012,532; 1928, \$1,291,845,989; and 1929, \$1,235,733,256.

<sup>3</sup> Includes income tax on Alaska Railways except in fiscal years 1935, 1936, and 1937; see footnote 2, above.

<sup>1</sup> Figures for 1791 through 1852 are not entirely comparable with later figures. The lack of comparability is, however, not sufficiently great to impair the usefulness of the figures. Statistics are for June 30, 1843 to 1945; for Jan. 1, 1791 to 1842.

<sup>2</sup> Includes old demand notes; United States notes (gold reserve deducted since 1900); postal currency and fractional currency less the amounts officially estimated to have been destroyed; and also the deposits held by the Treasury for the retirement of Federal Reserve Bank notes, and for national bank notes of national banks failed, in liquidation, and reducing circulation, which prior to 1890 were not included in the published debt statements. Does not include gold, silver, or currency certificates, or Treasury notes of 1890 for redemption of which an exact equivalent of the respective kinds of money or bullion was held in the Treasury.

<sup>3</sup> Exclusive of the bonds issued to the Pacific Railways (provision having been made by law to secure the Treasury against both principal and interest) and the Navy pension fund (which was in no sense a debt, the principal being the property of the United States).

<sup>4</sup> Includes certificates of indebtedness. Also includes refunding certificates of deposit 1880-1907, inclusive.

<sup>5</sup> Includes old Treasury (War) savings securities from 1918 through 1929.

<sup>6</sup> Comprises special issues to Government agencies and trust funds.

<sup>7</sup> Figure for 1843 is for July 1; January 1 figure is \$20,201,000. Figures for gross debt for 1791 to 1842 are as of January 1.

Data: P 132-143

<sup>1</sup> Net income for 1913-1943 is total income less statutory deductions, but before deduction of exemption or credits allowable in computing amount subject to tax. For 1944 and 1945, *adjusted gross income* (defined as gross income minus allowable trade and business deductions, expense of travel and lodging in connection with employment, reimbursed expenses in connection with employment, deductions attributable to rents and royalties, certain deductions of life tenants and income beneficiaries of property held in trust, and allowable losses from sales of property) is shown instead of net income.

<sup>2</sup> Credits against tax consist of: (1) For 1923, amount of 25 percent reduction provided by Revenue Act of 1924; (2) for 1924-31, 25 percent of tax on earned net income; and (3) for 1924-33, 12½ percent of capital net loss from sales of assets held more than 2 years where such loss has not been deducted in arriving at net income. For all years, credits for (1) tax paid at source and (2) taxes paid to foreign countries or possessions of the U. S. are not included in credits against tax as shown.

<sup>3</sup> Comprises optional tax, alternative tax, and tax on capital net gain. Optional tax is that paid in lieu of normal tax and surtax by individuals electing to file Form 1040A, for gross income of not more than \$3,000 entirely from salary, wages, dividends, interest, and annuities. (Rents and royalties are included for 1941 only.) For 1938 through 1945 the alternative tax is imposed on returns with net long-term capital gain when such alternative tax is less than the sum of the normal tax and surtax computed on net income including net long-term capital gain; for 1938 through 1941, the alternative tax is imposed on returns with net long-term capital loss when such alternative tax is greater than the sum of the normal tax and surtax computed on net income after deducting net long-term capital loss. Alternative tax on returns reporting

deficit due to net long-term capital loss, which tax amounted to \$615,000 for 1938, \$300,000 for 1939, \$473,000 for 1940, and \$2,326,000 for 1941, is excluded.

<sup>4</sup> (a) Tax computed on net income for respective year without regard to comparison of tax liability on the two returns as provided by Current Tax Payment Act. Tax shown for 1943 is amount of income and Victory tax after deducting credits for tax paid at source and tax paid to a foreign country or possession of United States which credits for 1943 amounted to \$16,803,000 for individuals, estates, and trusts. Tax for 1942 and prior years is amount before deduction of such credits, while the amount of tax for 1943-1945 is after deduction of such credits. (b) Total tax reported on 1943 returns of individuals, estates, and trusts with net income, including adjustments under Current Tax Payment Act and after deducting credits referred to in (a) above is \$17,114,112,000 which includes the total tax on 1943 income (see (a) of this note), additional tax of \$671,588,000 on individual returns showing 1943 tax increased to equal 1942 tax liability and unfor-given portion of 1942, and 1943 tax on individual returns, amounting to \$1,853,201,000. (On returns with no net income for income tax purposes in 1943, there is a tax of \$31,800,000 which is not included in total shown above. This excluded tax consists of (1) adjustments under Current Tax Payment Act on individual returns and (2) Victory tax on returns of individuals, estates, and trusts.)

<sup>5</sup> Includes defense tax 1940, \$128,350,000; 1941, \$1,150,000; not shown separately here. The defense tax, applicable only to taxable years beginning in 1940, is 10 percent of total income tax before deducting any credit, but not in excess of 10 percent of amount by which net income exceeds such income tax.

<sup>6</sup> Includes war excess-profits tax of \$101,250,000 on individuals and \$103,888,000 on partnerships.

Series P 152-164.—FEDERAL GOVERNMENT FINANCES—INCOME TAX RETURNS, CORPORATION: 1909 TO 1945

<sup>1</sup> All corporations are required to file returns except those specifically exempt, such as those mutual, fraternal, civic, and charitable organizations not operating for profit. The total number of returns shown includes returns of inactive corporations.

<sup>2</sup> The amounts shown for 1917-1922 consist of war profits tax and excess-profits tax. The amount shown for 1922 was reported on returns with fiscal years beginning 1921; and (declared value) excess-profits tax under the NIRA was in effect for 1933 and subsequent years. Figures for 1940-45 also include excess-profits tax under the Second Revenue Act of 1940: For 1940, \$373,511,000; for 1941, \$3,359,186,000; for 1942, \$7,351,314,000; for 1943, \$11,291,433,000; for 1944, \$10,431,762,000; and for 1945, \$6,557,006,000. The amount tabulated for the years 1942 through 1945 is the excess-profits tax liability reported on corporation excess-profits tax returns, less the credit for debt retirement and the net post-war refund. The amounts for 1943 through 1945 are before the amount deferred under sec. 710 (a) (5) (relating to abnormalities under sec. 722) and after any adjustments reported on the returns under any other relief provisions. The amount for 1942 is after both the sec. 710 (a) (5) deferral and any adjustments reported on the returns under any other relief provisions. For 1942-1945 the amounts shown are before any changes resulting from renegotiation of war contracts after returns were filed.

<sup>3</sup> The amount "Dividends paid" excludes liquidating dividends; for years prior to 1923, excludes also dividends paid by life insurance companies.

<sup>4</sup> Returns of inactive corporations prior to 1927 are included in those reporting no net income.

<sup>5</sup> (a) For 1942-1945, income and taxes as shown do not reflect the effect of changes resulting from the renegotiating of war contracts after returns were filed. Amounts representing the reduction in profits and taxes due to renegotiation after the returns were filed are shown in *Statistics of Income* for 1942 and for 1943, part 2. (b) Beginning 1942, instead of the special deduction for reserves which was previously allowable to life insurance companies in arriving at net income, there is allowable a credit against net income. As a consequence, there is an increase in both the number of returns reporting net income and in the amount of net income reported.

<sup>6</sup> Data for 1909 through 1915 are for the fiscal year ending June 30 of the following year, as shown in the annual reports of Commissioner of Internal Revenue; 1915 contains data from approximately 82,000 returns related to 1914. (See Annual Report, Commissioner of Internal Revenue, 1916, p. 26.)

Series P 165-169.—FEDERAL GOVERNMENT FINANCES—POSTAL RECEIPTS AND EXPENDITURES: 1789 TO 1945

<sup>1</sup> From 1789 to 1842 the fiscal year ended Dec. 31; from 1844 to date, June 30. Figures for 1843 are for a half year, Jan. 1 to June 30.

<sup>2</sup> Postal expenditures include adjusted losses, etc.—postal funds and expenditures from postal balances, but are exclusive of departmental expenditures in Washington, D. C., to the close of fiscal year 1922, and amounts transferred to the civil service retirement and disability fund, fiscal years 1921 to 1926, inclusive. For 1927 and subsequent years salary deductions are included in "Postal expenditures," the deductions having been paid to and deposited by disbursing clerks for credit of the retirement fund. From 1930 to 1945, "Extraordinary expenditures" as reported under the act of June 1930 are included, that is, the differences between free or reduced postage and regular rates.

<sup>3</sup> On basis of warrants issued from 1793 to 1915, and on basis of daily Treasury statements from 1916 to date (1945).

<sup>4</sup> On basis of warrants issued prior to 1922 and on basis of daily Treasury statements for 1922 and thereafter. Represents advances from the General Fund of the Treasury to the Postmaster General to meet

deficiencies in the postal revenues. These figures do not include any allowances for offsets on account of extraordinary expenditures or the cost of free mailings contributing to the deficiency of postal revenues certified to the Secretary of the Treasury by the Postmaster General pursuant to the act of Congress approved June 9, 1930. Excludes amounts transferred to the civil service retirement and disability fund under act of May 22, 1920 (41 Stat. 614), and amendments thereto on account of salary deductions of 2½ percent, as follows: 1921, \$6,519,633.59; 1922, \$7,899,006.28; 1923, \$8,284,031.00; 1924, \$8,679,658.60; 1925, \$10,266,977.00; and 1926, \$10,472,239.59.

<sup>5</sup> Repayment of unexpended portion of prior years' advances.

<sup>6</sup> Exclusive of General Fund payments from the appropriation "Additional compensation, Postal Service" under authority of the act approved Nov. 3, 1919, in the amounts of \$35,638,400, \$1,374,015, and \$6,700 for the fiscal years 1920, 1921, and 1922, respectively.

<sup>7</sup> Actual advances from General Fund were reduced by repayment of \$5,800,000 from prior year advances which were carried to surplus.

<sup>1</sup> Includes plant inventions, beginning 1931. Plant total varies from 5 patents granted in 1931 to 85 in 1940.

<sup>2</sup> Included in series P 176-178. Figure for 1800-1835 is 5; for 1790-1799 is 2.

<sup>3</sup> Includes designs, 1867-1879, and reissues, 1867-1876.

<sup>4</sup> Renewals not included prior to 1925.

<sup>5</sup> From July 4 to end of year.

<sup>6</sup> To July 4.

**Series P 188-201.—STATE AND LOCAL GOVERNMENT—GENERAL REVENUE AND EXPENDITURE, AND GROSS DEBT: 1890 TO 1945**

[In millions of dollars. Because of rounding, detail does not always add to total. Amounts for "State and local governments" exclude duplicating fiscal aid—that between State and local governments. Thus only fiscal aid transactions with the Federal Government are reflected in the fiscal aid total]

YEAR	GENERAL REVENUE					GENERAL EXPENDITURE								Gross debt less sinking funds (general and enterprise)
	Total	Property	Other taxes	Aid received from other governments	Charges and miscellaneous	Total	Provision for debt retirement	Total, excluding provision for debt retirement	Operation	Aid paid to other governments	Capital outlay	Interest	Contributions to trust funds and enterprises <sup>1</sup>

<sup>1</sup> Contains contributions to enterprises and to retirement and other trust funds for States from 1941 to 1945 and for cities for 1942. Other data refer only to contributions to retirement funds.

<sup>2</sup> Omits revenue and expenditure of incorporated places having less than 2,500 inhabitants, school districts overlying such places, townships, and special districts.

<sup>3</sup> Included in operation; amounts not separable.

<sup>4</sup> A nonsegregable amount of capital outlay is included in operation.

<sup>5</sup> Comprises only school and highway grants; other grants included in operation.

<sup>6</sup> Less than \$500,000.

<sup>7</sup> Pension payments of city corporations and overlying local governments of cities having 30,000 inhabitants or more; originally included in operation.

<sup>8</sup> Statistics for 1913 and 1890, although included in "Local governments other than counties", are not segregable for separate presentation.

<sup>9</sup> City corporations include only cities having 8,000 inhabitants or more; statistics of all other cities are included in the estimated revenue and expenditure of "Other local governments".

Series P 202-211.—STATE AND LOCAL GOVERNMENT—GENERAL EXPENDITURE FOR OPERATION: 1890 TO 1942

In millions of dollars. Because of rounding, detail does not always add to totals

<sup>1</sup> Represents net collections deposited in State clearing accounts.  
<sup>2</sup> Includes revenue from following sources: Sales and gross receipts taxes on insurance companies, public utilities, pari-mutuels, admissions and amusements, and soft drinks; licenses for corporations in general,

hunting and fishing, occupations, chain stores, and amusements and race tracks; and poll, documentary stock transfer, and miscellaneous taxes.

\* Segregation of individual and corporation income taxes not available.

Series P 250-264.—STATE AND LOCAL GOVERNMENT—MAJOR CITIES, FINANCIAL SUMMARY: 1902 TO 1945

[ Amounts in millions of dollars. Because of rounding, detail does not always add to total. Comprises combined totals for all cities having 100,000 inhabitants or more at the decennial census preceding the given date or, for 1902, 1912, 1923, and 1927, estimated as having 100,000 inhabitants or more at the given date. Expenditures for operation and capital outlay, which are included in total expenditure, are shown by function in series P 265-277 ]

<sup>1</sup> For 1937 and later years, local shares of State-administered taxes are classified as State aid and the cities' shares of such taxes are included in aid received; for 1936 and earlier years, local shares of State taxes are classified as local tax revenue, and the cities' shares are included in "Other taxes"

<sup>2</sup> Data not available; for cities having 250,000 inhabitants or more, assessed valuation amounted to 45.1 billion dollars in 1942; 46.6 billion dollars in 1943; 49.4 billion dollars in 1944; and 49.7 billion dollars in 1945.

<sup>3</sup> 1940 population; no later data available.

<sup>4</sup> Restricted to interest payments from general funds; omits payments from sinking funds.

<sup>5</sup> Finances of overlying school and other special districts prorated according to the ratio of the part of the assessed valuation of the overlying unit within the city area to the total valuation of the overlying unit. County finances prorated only for counties overlying cities having 300,000 inhabitants or more.

<sup>6</sup> Amounts originally reported as retirement benefits to public employees.

<sup>7</sup> Data not available.

<sup>8</sup> Segregation between general and enterprise debt estimated according to the ratio of total general debt to total gross debt for the fiscal year 1904.

Series P 265-277.—STATE AND LOCAL GOV'T—MAJOR CITIES, GENERAL FUNCTIONAL EXPENDITURE: 1902 TO 1945

[ In millions of dollars. Because of rounding, detail does not always add to total. Comprises combined totals for all cities having 100,000 inhabitants or more at the decennial census preceding the given date or, for 1902, 1912, 1923, and 1927, estimated as having 100,000 inhabitants or more at the given date ]

<sup>1</sup> Segregation between health and hospitals estimated for cities having from 100,000 to 250,000 inhabitants.

<sup>2</sup> Revised to exclude expenditures of schools in Birmingham and San Francisco, which were reclassified as independent school districts in 1943.

<sup>3</sup> Expenditure of each overlying school and other special district prorated according to the ratio of the part of the assessed valuation of the overlying unit within the city area to the total assessed valuation of the overlying unit. County expenditure similarly prorated only for counties overlying cities having 300,000 inhabitants or more.

<sup>4</sup> Included in "other"; data not available.

<sup>5</sup> Less than 1 million dollars.

<sup>6</sup> Segregation by function not available.

<sup>7</sup> Highways include sanitation and health.

<sup>8</sup> No data available.

<sup>9</sup> Public welfare includes correction.

<sup>10</sup> Schools include libraries.

The series in this appendix are confined to those which have moved in rather close harmony with the ebb and flow of general business activity, though not without some characteristic differences in timing. No data are presented, for example, on marketings of farm products, which have shown fluctuations largely independent of business cycles. Contrary to common belief, exports are not always closely related to general business activity; indeed the connection was very slight before 1914. Export series App. 19 has been included mainly because it is convenient to have data on exports side by side with imports.

A word of caution is necessary regarding the use of the series for historical comparisons. The presentation of data in a continuous series does not necessarily imply that their content has remained unchanged. For example, makers of index numbers must use what data are available; as the scope of available data changes, the content of their indexes often changes as well. That is one reason why so few general indexes are included here. Furthermore, though the composition may formally remain the same, methods of estimation may vary; see, for example, the description of the early series on railroad freight ton-miles (series App. 12). Finally, the economic significance of well-defined activities may vary over time. As carriers of freight, the railroads gradually superseded wagons and waterways; but more recently trucks, pipelines, and aircraft have encroached upon railway traffic. With these changes, railroad freight ton-miles first became more representative of the freight traffic of the Nation, then less. In describing the series, an attempt has been made to indicate formal changes in content and method of estimation. But the descriptions are incomplete; and the user of the statistics must be on his guard lest his comparisons are vitiated by shifts in the relationship of the data to the magnitudes that concern him.

#### DESCRIPTION OF SERIES (App. 1-30)

**App. 1. Personal income (Department of Commerce), monthly, 1929-1945.** SOURCE: Compiled by the Bureau of Foreign and Domestic Commerce. For 1929-1943, see National Income Supplement to *Survey of Current Business*, July 1947; for 1944-1945, see *Survey of Current Business*, July 1948. Seasonal adjustment is by the Bureau of Foreign and Domestic Commerce. For annual data, 1929-1945, see series A 134.

This series measures the current income received by persons from all sources, including income in kind. Not only individuals, but nonprofit institutions and private pension, welfare, and trust funds, are classified as "persons." Personal income is measured as the sum of wage and salary receipts, other labor income, proprietors' and rental net income, interest and dividends, and transfer payments for which no services are rendered currently, such as relief payments, old age pensions, corporate gifts to nonprofit institutions, and individuals' bad debts to business. Among the items of income in kind included are military income in kind, food and fuel produced and consumed on farms, imputed net rent on owner-occupied dwellings, and imputed interest. Certain elements of current income, such as employee contributions for social insurance and the excess of wage accruals over disbursements, are excluded because they are not subject to disposal by the individual.

Personal income may be larger or smaller than national income, but has a large element in common with it, and it is the largest component of national income available on a monthly basis. To arrive at national income as computed by the Department of Commerce, it is necessary to add to personal income undistributed corporate profits exclusive of inventory profits, corporate profits, taxes, contributions to social insurance funds, and the excess of wage accruals over disbursements; and to subtract transfer payments and net interest paid by government.

The Department of Commerce publishes certain components of personal income, such as wage and salary receipts and nonagricultural income, in seasonally-adjusted monthly form. Quarterly

data, seasonally-adjusted and unadjusted, are published for total personal income and disposable income (personal income less personal tax and nontax payments to government), as well as for national income and gross national product. The personal income estimates are somewhat larger than the formerly published series on income payments, principally because of the inclusion in personal income of net imputed rent on owner-occupied dwellings and military income in kind.

**App. 2. Personal income (Barger), quarterly, 1921-1931.** SOURCE: Furnished by the National Bureau of Economic Research, and based on data given by Barger, Harold, *Outlay and Income in the United States, 1921-38*, National Bureau of Economic Research, New York, 1942, and Kuznets, Simon, *National Income and its Composition, 1919-38*, volume I, NBER, 1941.

Certain of Barger's quarterly income series were combined with quarterly interpolations of several of Kuznets' annual series to obtain a total conforming approximately to the Department of Commerce concept of personal income (series App. 1). The total was derived in seasonally adjusted form only. The components are as follows (table numbers refer to source volumes):

1. Salaries and wages in all private industry and net income of farm operators and proprietors in service and miscellaneous industries. This is Barger's "short-term income" (table 18).
2. Interest payments by private industry and net rentals paid to individuals. This is Barger's "long-term income" (table 18).
3. Income distributed by government: Wages, salaries, pensions, relief payments, and long-term interest (Barger, table 18).
4. Entrepreneurial net income (withdrawals plus net savings) except in agriculture, service, and miscellaneous industries (see item 1, above). Kuznets' annual data (tables 46, 52) were interpolated by a moving average.
5. Dividend payments. Kuznets' annual data (table 54) were interpolated by the *Journal of Commerce* monthly series on dividend payments and smoothed by a moving average.
6. Dividend and interest payments from abroad. Kuznets' annual data (table 57) were interpolated by a moving average.

Owing to the sparsity of quarterly data before 1929 the methods of estimation used for many of the components are necessarily crude and the resulting aggregates can be considered only rough approximations. Over half of the total is derived through a moving average graduation of annual data. Although for the most part the components covered by such graduation are more stable than the rest, hence subject to smaller errors of estimate, the method is nevertheless likely to impart certain smoothing biases to the total. For detailed descriptions of the methods of estimation used by Barger and by Kuznets and tests of the dependability of the results, see the sources cited.

**App. 3. Index of factory employment (Bureau of Labor Statistics), monthly, 1919-1945.** SOURCE: Original data compiled by Bureau of Labor Statistics and published as follows: For 1919-1939, see *Employment and Pay Rolls*, December 1940; for 1939-1945, see *Employment, Pay Rolls, Hours, and Earnings—All Manufacturing Industries*, mimeographed release LS48-3596 (6-48). Seasonally adjusted data are from the Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, various issues beginning October 1938. For related annual and decennial data on factory employment, see series D 51 and D 69.

The index on the 1923-1925 base presented here through 1939 was compiled from reports of establishments representing 13 manufacturing industries 1919-1922, 43 to 64 industries 1923-1930 and 92 industries beginning in 1932 (see Bureau of Labor Statistics *Bulletin* 610). However, the index is adjusted to levels indicated by the biennial Census of Manufactures for all manufacturing industries, 1919 through 1939. It is available through September 1942. The seasonal adjustment of the index, which is accomplished by prior adjustment of the component industry indexes, is described in the *Federal Reserve Bulletin* for October 1938 and October 1939.

The index on the 1939 base presented here for the years 1939 through 1945 covers a substantially larger number of manufacturing industries (154) and has been adjusted to levels indicated by Social Security records through 1945.

**App. 4. Index of factory employment (Jerome), monthly, 1889-1923.** SOURCE: Original data are from Jerome, Harry, *Migration and Business Cycles*, National Bureau of Economic Research, 1926, p. 248. Seasonal adjustment is by the National Bureau of Economic Research. A trend-adjusted version, with slightly different seasonal adjustment, is given by Jerome, p. 249 of the source volume.

For 1889-1894 the index is based on Massachusetts data; for 1895-1903, on statistics for Massachusetts and New Jersey; for 1904-1919, on data for Massachusetts, New Jersey, and New York; and for 1920-1923, on series for Massachusetts and New York only, since the New Jersey data cease to be available. To weld the State series into a single continuous index, Census of Manufactures statistics of wage earners employed in each of the three States in the years 1899, 1904, 1909, 1914, 1919; and 1921 were first adjusted for variations in coverage; these adjustments were aimed principally at excluding workers in the hand and neighborhood industries from the 1899 census since in subsequent censuses only factory workers were counted. Next, monthly estimates of the number employed in factories in each of the three States were made by using directly the monthly Census of Manufactures' data for the given State in census years and interpolating between these years by means of indexes constructed from the available employment and unemployment (inverted) data for the given State.

The separate State estimates were then added together and converted to an index on the 1914 base, allowance being made for changes in the number of States covered by splicing on the basis of overlapping standings in January of the years in which States were added to or dropped from the index. Further details on the method of deriving the State estimates are given in the source.

The representativeness of Jerome's index can be tested at quinquennial dates 1899-1919 and biennially 1919-1923 by comparison with Fabricant's annual index of wage earners employed in manufacturing, which in census years is based on adjusted Census of Manufactures' data for the United States (see Fabricant, Solomon, *Employment in Manufacturing, 1899-1939*, National Bureau of Economic Research, 1942, p. 331). The ratio of Jerome's index to Fabricant's (both on a 1914 base) is 0.974 in 1899, 1.004 in 1904, 0.987 in 1909, 1.000 in 1914, 0.933 in 1919, 0.993 in 1921, and 0.896 in 1923. These ratios suggest that the trends in Jerome's index and in the country-wide totals are roughly the same; and further, since 1904, 1914, and 1921 were years of low employment while the remaining census years were years of average or high employment, that the relative amplitude of fluctuation indicated by Jerome's index is somewhat smaller than that for the country as a whole.

Essentially similar results emerge from comparisons with Fabricant's index for intercensal years and with Edwin Frickey's quarterly index of manufacturing employment (1889-1914), both of which are based only in part on the data used by Jerome. Frickey's index is charted in his *Economic Fluctuations in the United States* (Harvard, 1942), p. 215.

**App. 5. Index of the physical volume of business activity (Babson), monthly, 1905-1922.** SOURCE: Furnished by Babson's Statistical Organization, Inc. (now Business Statistics Organization, Inc.). This series is a seasonally adjusted index of the physical volume of commercial and industrial production inclusive of agricultural marketing and processing but exclusive of agricultural production proper. Over the period 1905-1922 the coverage ranges from 26 series in 6 major groups in 1905 to 53 series in the same 6 groups plus electric power in 1922. The main groups and their components (the components in 1905 are in italics), and the percentage weights of the groups at the close of 1922, are as follows:

**Manufactures (58.4):**

*Butter; cattle and hog slaughter; sheep slaughter (until December 1921); flour; sugar meltings; cotton takings (later cotton consumption); knit underwear; wool consumption; wool carding and combing machine activity; silk imports (later silk deliveries); silk broad looms activity; rubber imports (later pneumatic tires); passenger automobiles; trucks; coke; gasoline; gas and fuel oil; pig iron; steel ingots; paper; newsprint consumption; newspaper and magazine advertising; cement; boots and shoes; tobacco revenues (later cigars; cigarettes; smoking tobacco until December 1921).*

**Minerals (12.3):**

*Anthracite and bituminous coal; petroleum; natural gas; iron ore shipments (later ore carloadings); copper; lead; zinc.*

**Agricultural marketings (2.2):**

*Receipts of wheat, corn, oats, cotton, cattle, hogs, sheep and lambs, poultry, eggs; carloadings of apples, oranges, potatoes.*

**Building and construction contracts (9.6).**

**Railway freight revenue ton-miles (11.9).**

**Foreign trade (2.1):**

*Physical volume of exports and imports.*

**Electric power production (3.5).**

Series on consumption, shipments, and other activities not strictly classifiable as production are treated as indirect measures of related productive activities. To the same end, moving averages are used for building contracts, silk imports, rubber imports, and cotton takings because such averages were considered more suitable than the original data for series whose movements anticipate the phase of activity they are intended to represent. All series are in terms of physical volume or constant dollar magnitudes. Where possible, adjustments were made for variations in number of working days per month by reducing the series to a daily average basis.

The seasonal adjustment of the index is accomplished by the prior adjustment of each series individually. The adjusted series are combined in an aggregative index using value-added weights. Where possible, value-added weights have been taken from the Census of Manufactures; in other cases they have been estimated by the Babson organization. The sum of the weights, 29.1 billion dollars per year in 1923-27 including direct and indirect representation, is about 40 percent of total national income, exclusive of income originating in agriculture, in the same period.

To allow for changes through time in the relative importance of different series, two index numbers have been computed for each month over most of the period considered, one using value-added weights of the period 1923-1927, the other using value-added weights of the most nearly contemporaneous census year. Thus 1909 is used as an alternative weighting base for 1905-1911, 1914 for 1912-1916, and 1919 for 1917-1920. In these years the final index number for a given month is the geometric average of the two indexes computed with standard and alternative weights.

Comparison of annual averages of Babson's production index with Fabricant's annual index (see series J 13) of physical output of manufactures (*The Output of Manufacturing Industries, 1899-1937*, p. 44) shows close agreement in trend and year-to-year direction of movement. Fabricant's index, however, shows greater relative amplitude of fluctuation, presumably because it is confined to manufacturing output; annual ratios of Babson's index to Fabricant's tend to rise during periods of declining production and to fall during periods of rising production through a range of about 15 percent of their average level.

A further comparison can be made on a monthly basis with Ayres' index of the physical volume of manufacturing production, 1899-1918. This index is described (Ayres, *Turning Points in Business Cycles*, p. 202) as a monthly interpolation of Thomas' annual index of manufacturing output (*Federal Reserve Bulletin*, Jan. 1931, p. 46), and is the sum of a durables component and a nondurables component. The broad movements of this series agree closely with those of Babson's index, though a study of annual ratios of the

two indexes reveals a similar but weaker tendency for Ayres' index to fluctuate more widely than Babson's, the ratios varying through a range of about 10 percent of their average level.

While the Babson index is based on a broader concept of production than the Federal Reserve index of industrial production (series App. 6), which is limited to mining and manufacturing, the two indexes resemble one another closely in 1919-1922. An extension of the index back to 1870 (monthly) based on fewer series is available, and the Babson organization has also carried the index forward to date.

**App. 6-9. Indexes of industrial production, durable manufactures, nondurable manufactures, and minerals, monthly, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. Through July 1942, see *Federal Reserve Index of Industrial Production*, October 1943; for August 1942-1945, see *Federal Reserve Bulletin*, November 1943 and following issues. Indexes for durable and nondurable manufactures without seasonal adjustment are not available for 1919-1922. For the Federal Reserve annual indexes on total manufactures, durable and nondurable manufactures, and mineral production, see series J 30, J 31, J 38, and G 6.

The index of industrial production comprises mining and manufacturing production. Based on about 50 series in 1919-1922 the coverage was substantially increased beginning 1923 and again beginning 1939. Currently the index includes about 100 series distributed among 16 manufacturing and 2 mining industry groups. Some of the individual series are based on statistics of monthly output while others relate to consumption or shipments of materials, machinery-hours active, or man-hours worked. Statistics of man-hours worked are adjusted to allow for broad changes in output per man-hour, and many of the other series are adjusted to more accurate physical volume figures not available monthly. All principal mining and manufacturing industries are represented in the index.

The series are adjusted for variations in the number of working days per month and for seasonal variation before being combined into indexes. The indexes are of the aggregative type; the weights applied are based on value of minerals and value added by manufacture, 1923 values being used before 1929 (except that 1923-1925 average values are used for minerals 1919-1922) and 1937 values since.

For further details on the composition and construction of the index see the *Federal Reserve Bulletin*, October 1943, and the articles cited therein; also Garfield, Frank R., "Measurement of Industrial Production since 1939," *Journal of the American Statistical Association*, December 1944.

**App. 10. Pig iron production, monthly, 1877-1945.** SOURCE: For 1877-1921, see Macaulay, Frederick R., *The Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, 1938, table 27; for 1922-1945, see *Iron Age*, monthly issues. Seasonal adjustment by National Bureau of Economic Research, available through 1938 only. For related annual data on pig iron production, see series G 96-98.

Data are expressed as daily averages, obtained by dividing by the number of calendar days in the month. The figures do not include charcoal pig iron (except for small quantities included after 1941), or pig iron made in electric furnaces. Monthly figures for 1877-September 1901 were estimated from weekly capacity of furnaces in blast. The series is available in smoothed and trend-adjusted form, 1877-1929, in Macaulay's volume.

**App. 11. Railroad freight ton-miles (Interstate Commerce Commission), monthly, 1920-1945.** SOURCE: Original data from *Revenue Traffic Statistics of Class I Steam Railways in the United States*, Interstate Commerce Commission, monthly issues. Seasonal adjustment by the National Bureau of Economic Research. For related annual data, see series K 43-59.

The series is computed by multiplying the weight of a shipment in tons by the number of miles over which it moves, and summing such products for all shipments of revenue freight carried by all Class I railways, excluding switching and terminal companies. A monthly series on total net ton-miles, which includes movement of railway materials and supplies (in freight trains) in addition to revenue freight, is available earlier (1907-1914, 1916-1917 from the American Railway Association; beginning 1918 from the Interstate Commerce Commission). Total net ton-miles are about 10 percent larger than revenue ton-miles; changes in the two have been closely proportionate since 1920. A number of other series of railway statistics are useful as business indicators: Gross and net earnings, freight tons originated, freight carloadings, passenger-miles, orders for railway equipment (note also series App. 26 and 29.) For an analysis of railway traffic in relation to business activity see Hultgren, Thor, "Railway Freight Traffic in Prosperity and Depression," and "Railroad Travel and the State of Business," *Occasional Papers 5 and 13*, National Bureau of Economic Research, New York, 1942 and 1943.

**App. 12. Railroad freight ton-miles (Babson), monthly, 1866-1922.** SOURCE: Furnished by Babson's Statistical Organization, Inc. (now Business Statistics Organization, Inc.).

For 1866-1879 monthly data on gross earnings of 12 to 15 railroads were seasonally adjusted and converted to ton-miles by multiplying by annual ratios (interpolated monthly) of ton-miles of all railroads (revenue plus nonrevenue freight) to gross earnings of the selected roads. The annual ton-mile estimates for all roads are those of Snyder, Carl, *Business Cycles and Business Measurements*, p. 238, which in turn are based on Poor's data (*Manual of Railroads*) for 13 roads.

For 1879-1890 monthly gross earnings data were compiled for 24 to 27 railroads, estimated to carry 50 percent of the total traffic. Then for 1879-1883 the earnings were converted to ton-miles by the method indicated above. For 1883-1890 the earnings were multiplied by constant raising factors (1883-1886, 1.4; 1886-1890, 1.385), representing the average ratio of freight revenue of all railroads (Poor's) to the gross revenue of the sample roads, and the resulting estimated freight revenue was deflated by annual revenue per ton-mile (Poor's) interpolated monthly. For 1890-1909 the coverage of the monthly gross earnings data was about the same (50-55 percent) and the same method of converting to ton-miles was used, the raising factors (1890-1902, 1.321; 1902-1909, 1.253) being based on annual Interstate Commerce Commission data for total freight revenue and revenue per ton-mile for all railroads. For 1910-1914 the estimates are based on monthly ton-miles (revenue and nonrevenue freight) compiled by the American Railway Association, raised to represent the annual ton-miles (revenue freight) of Class I steam railways as reported by the Interstate Commerce Commission. For 1914-1916, the monthly freight revenue of Class I steam railways, Interstate Commerce Commission, was divided by the monthly-interpolated annual revenue per ton-mile. For 1916-1919 the monthly revenue and nonrevenue ton-miles compiled by the Bureau of Railway Economics were reduced to represent revenue ton-miles. From 1919 (*sic*, 1920) the Interstate Commerce Commission data for revenue ton-miles (series App. 11) are used, adjusted for seasonal variation by Babson. Though available, we do not present the Babson series beyond 1922; throughout the period presented the series is a 2-month moving average of seasonally adjusted data, placed in the second month.

The variety of methods used in constructing this series was dictated by the availability of data. The method of deflating by interpolated freight revenue per ton-mile was based on the consideration that the movements in freight revenue per ton-mile are relatively gradual except when there are general changes in freight rates. Furthermore, the proportion of freight to total revenue has been large and fairly stable; from 1891 to 1909 the proportion, based on annual Interstate Commerce Commission data, varied

from 66 to 71 percent. Comparison of the Babson gross earnings series (1870-1909) with the independently derived monthly series of Cole, Arthur H. (*Review of Economic Statistics*, February 1936, pp. 31-41), indicates fairly good agreement in short-run movement, though the levels of the series differ considerably. The annual totals of the first segment of the Babson series (1870-1879) are 23 to 40 percent lower than those of the Cole series; the later segments are higher, by percentages ranging from 14 to 24 in 1879-1890, 21 to 26 in 1890-1902, and 27 to 31 in 1902-1909.

Since the annual ton-miles for all railroads given by Poor's, 1882-1890, and by the Interstate Commerce Commission, 1890-1916, were used (implicitly) only to establish average levels in the Babson series (except 1910-1914, as noted above), a comparison of the series year-by-year is of interest. The comparison cannot be precise, however, for the Babson series is a 2-month moving average and is seasonally adjusted; annual totals computed from such a series are almost certain to differ from annual totals of original data. Moreover, Poor's data are for fiscal years that varied among railroads; although we may assume, as the Babson estimates do for gross earnings, that the Poor's data are approximately equivalent to data for years ending October 31, this factor may still account in part for discrepancies between Babson's and Poor's ton-miles. In any event, after 1895 the Babson series reproduces the annual all-railroads series rather closely, the annual percentage differences seldom exceeding plus or minus 2 percent. Before 1895 the differences are larger, though most of them fall within a range of plus or minus 5 percent.

**App. 13. Index of department store sales, monthly, 1919-1945.** SOURCE: Board of Governors of the Federal Reserve System. For 1919-1938, see *Federal Reserve Bulletin*, June 1944; for 1939-1945, see "Department Store Sales Indexes (1935-39=100), United States," mimeographed release by the Division of Research and Statistics, corrected as of April 14, 1948.

The index of department store sales, representing the dollar volume of sales unadjusted for price changes, is compiled from reports by a varying number of department stores that submit information to the various district Federal Reserve Banks. The sample covered around 500 stores in the 1920's and 1930's. In the early 1940's it was increased to about 1,400 stores, covering more than one-third of the 4,051 department stores included in the 1939 Business Census tabulations and more than 70 percent of their total sales. The sample includes sales of chain department stores and retail stores of two large mail order houses.

An index for each of the 12 Federal Reserve districts is obtained from aggregate sales of the district sample allowing for changes in the list of reporting stores. The indexes are adjusted to the levels indicated by the 1929 and 1939 censuses of retail trade. Each of the district indexes is adjusted for variations in the number of trading days in the month, and each is likewise adjusted for seasonal variation, including an allowance for the varying date of Easter. To obtain the national index the district indexes are weighted by the relative importance of the sales of the department stores in the district in the base period 1935-1939; the requisite information is obtained by a backward extension of Census data for 1939.

For further details see the following *Federal Reserve Bulletins*: June 1944, August 1936, and February and April 1928.

**App. 14-15. Bank clearings, New York City, monthly, 1853-1922; outside New York City, monthly, 1875-1922.** SOURCE: Furnished by the National Bureau of Economic Research. Through 1883 data are from *Annual Reports* of the New York State Chamber of Commerce, *Banker's Magazine*, *Merchants' Magazine*, and *The Public*; since 1884, *Commercial and Financial Chronicle*. For related annual data on bank clearings, see series N 86-89.

Monthly totals are converted to daily averages by dividing by the number of calendar days in the month. For 1860-1863 the New York figures are obtained by prorating weekly figures according to the number of business days in the week falling in each

month; for March 1872-December 1878 they include gold exchanges. For 1875-1878 the outside New York figures were adjusted to approximate calendar month totals since about half of the reported monthly clearings were for 4- or 5-week totals instead of for the calendar month. Half of each monthly figure was reallocated in proportion to the number of days of the current and adjacent months included in the corresponding 4 or 5 weeks.

Bank clearings represent checks drawn on individual banks and credited to the accounts of other banks through city clearinghouse associations in which the individual banks are members. They thus take no account of checks drawn to "cash" and debited directly on the accounts of the paying bank; and they contain no record of financial transactions between firms which use the facilities of the same bank—hence clearings may decline as a result of bank mergers. On the other hand, as actually reported by clearinghouse associations, they contain a number of duplicating items connected with the process of clearing. Though clearings figures are available beyond 1922, for the purpose of representing total check transactions the bank debits figures starting 1919 (series App. 16-17) are preferable. For a discussion of the relation of bank debits to clearings see the *Federal Reserve Bulletin* for September 1918; also *Debits and Clearing Statistics, Their Background and Interpretation*, by George Garvy (Board of Governors of the Federal Reserve System, 1947).

The present record of bank clearings outside New York City (series App. 15) covers a gradually increasing list of cities. In 1875 the cities included were Baltimore, Boston, Chicago, Cincinnati, Columbus, New Orleans, Pittsburgh, Philadelphia, St. Louis, and Worcester. According to *The Public*, reports from these cities and New York accounted for 12 clearinghouses, embracing 312 banks, out of a total for the country of 20 clearinghouses, embracing 394 banks. By 1885 the number of cities had increased to 29; by 1900 it had grown to 56; and in 1922 it was 183. The number of clearinghouses in existence in 1919 is estimated at 250. No adjustments were made for the upward bias of the series due to its expanding coverage.

An identical series on New York clearings, with a different seasonal adjustment, and a similar series on outside clearings, in which adjustments for changes in the number of cities included have been made are given by Frederick R. Macaulay in *The Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, New York, 1938, tables 27 and 29. Macaulay's series are presented in original and (in the case of outside clearings) in deflated form, and both versions are also given in seasonally adjusted, smoothed, and trend-adjusted forms.

A series on clearings in seven cities outside New York, 1866-1914, is charted and described in Edwin Frickey's *Economic Fluctuations in the United States*, Harvard, 1942, pp. 338, 360-1. Carl Snyder's clearings index of business, *Journal of the American Statistical Association*, September 1924, is based on outside clearings 1875-1918 and outside debits thereafter and is smoothed and adjusted for trend, seasonal, and price changes. It has been extended through 1939 by the Federal Reserve Bank of New York.

**App. 16-17. Bank debits, New York City and outside New York City, monthly, 1919-1945.** SOURCE: Compiled by the Board of Governors of the Federal Reserve System. For 1919-1941, see *Banking and Monetary Statistics*, 1943; since 1942, see *Federal Reserve Bulletin*. Seasonal adjustment by the National Bureau of Economic Research. For annual Federal Reserve Board data on bank debits, see series N 76-79.

The series on debits outside New York City is for 140 reporting centers. For a description of these and other debits series see *Banking and Monetary Statistics*, pp. 230-54. In 1942 the collection of debits statistics was changed from a weekly to a monthly basis, and a number of banks in previously reporting centers and 60 new reporting centers were added to the reporting sample. See the

*Federal Reserve Bulletin*, August 1943, p. 717, and February 1944, p. 160.

**App. 18-19. Value of imports, exports, monthly, 1866-1945.** SOURCE: Department of Commerce. For July 1866-June 1913, see *Monthly Summary of Commerce and Finance of the United States*, December 1910 and later issues; for July 1913-1945, see *Monthly Summary of Foreign Commerce of the United States*, July 1914 and later issues. Seasonal adjustment by the National Bureau of Economic Research, available through 1939 only. For related annual data on imports and exports, see series M 51-55.

Statistics of exports and imports reflect trade between the United States customs area (continental United States, Alaska, Hawaii, Puerto Rico, and, from 1935 through 1939, the Virgin Islands) and all other countries and their possessions, but do not reflect trade between territories within this customs area or in-transit shipments moving through the area from one foreign country to another. Total exports include exports of domestic merchandise plus reexports of foreign merchandise, and after March 1941, also include shipments of merchandise under the Lend-Lease program. Total imports represent "general imports," i. e., merchandise entering consumption channels immediately upon arrival plus entries into bonded warehouses.

Export values are those declared by the shipper at the point of shipment out of the country (except for reexports from bonded warehouses, which are expressed at import prices); import values are those of the principal exporting market. Both imports and exports include costs of all containers and coverings as well as freight expenses from producing point to shipboard, but not beyond. All figures are in terms of United States dollars unadjusted for the change in the gold content of the dollar in 1934, foreign values of imported merchandise being converted into dollars at the rate of exchange prevailing on the day the merchandise is shipped from the exporting country.

Monthly data on values of imports and exports by economic classes (crude materials, crude foodstuffs, manufactured foodstuffs, semi-manufactures, and finished manufactures) are available beginning 1905. Indexes of the physical volume of imports and exports are compiled by the Department of Commerce, quarterly beginning 1929, monthly from July 1933.

**App. 20. Value of building permits (Bradstreet's), monthly, 1911-1945.** SOURCE: Compiled by Dun and Bradstreet, Inc., see their *Monthly Review*, September 1935; and *Dun's Statistical Review*, January 1939, May 1947. Seasonal adjustment by the National Bureau of Economic Research, available only through 1941.

Reports are furnished to the compilers monthly by the building departments of 120 identical cities. The figures represent aggregate value (builders' estimated costs) under permits issued to prospective builders within the corporate limits of the cities concerned, and include new residential and new nonresidential building, as well as additions, alterations, and repairs.

Indexes of number and value of permits, beginning 1929 and based on a much larger number of cities, are compiled by the Bureau of Labor Statistics.

**App. 21. Index of the value of building permits (Long), monthly, 1891-1914.** SOURCE: Compiled by Long, Clarence D., Jr., *Building Cycles and the Theory of Investment*, Princeton, 1940, pp. 213-23. Seasonal adjustment by the National Bureau of Economic Research. For related annual data on the value of building permits, see series H 77-79.

Long's index is based on the aggregate value (builders' estimated costs) of all building for which permits were granted or plans filed in an increasing sample of cities ranging from 13 in 1891 to 34 in 1914. The cities are among the Nation's largest and, although the East dominates the index, every region is represented. "Alterations and repairs are included, but State and local public building are frequently excluded, Federal public building is usually excluded, and rural building is always excluded" (source, p. 100). No attempt is made to adjust the data for fluctuations in

construction costs, the index being simply the ratio of the estimated aggregate cost of building in the cities covered in a given month to the average monthly aggregate cost of building in the same cities in 1930.

Though Long's index spans the period 1868-1940, its coverage does not reach five cities until 1882. Moreover, the addition of Chicago to the index in 1891 apparently disturbs the cyclical contraction of 1890-91. Whereas J. R. Riggleman's annual index, based on 34 cities in 1890-91 (*Variations in Building Activity in United States Cities*, unpublished manuscript, Johns Hopkins University Library, 1934), shows a clear trough in 1891, Long's index continues to rise. Comparison of Long's and Riggleman's indexes in later years does not reveal any marked discrepancy. Bradstreet's value of building permits in 120 cities (series App. 20) begins in 1911 and has a larger coverage than Long's index, which reaches a maximum of 37 cities in 1918.

**App. 22. Value of construction contracts (Dodge), monthly, 1910-1945.** SOURCE: Furnished by the F. W. Dodge Corp. Seasonal adjustment by the National Bureau of Economic Research, available through 1939 only. For annual data on value of construction contracts, see series H 51-54.

The series is compiled from field reports of individual project contracts in 27 Northeastern States in 1910-1925 and in 37 States east of the Rocky Mountains in 1925-1945. Data for 36 States are available back to 1923, and for the New England States back to 1901. The reports cover small towns and rural districts as well as large cities, and aim at inclusion of all projects for new construction, additions, and alterations costing \$5,000 or more in early years, and \$2,000 or more in most years since 1929. No maintenance work, and only large farm building projects are included; some force account work is included. For estimates of the series' coverage see Chawner, Lowell J., "Construction Activity in the United States, 1915-1937," Department of Commerce, *Domestic Commerce Series No. 99*, 1938.

In addition to statistics on value of contracts, Dodge series are available on number of projects and floor space of buildings; and subdivisions by geographic area, ownership, and type of project are provided. Seasonally adjusted indexes (three-month moving averages) for total, residential, and all other construction contracts (value), based on Dodge statistics, have been compiled by the Board of Governors of the Federal Reserve System for the period since 1919. See *Federal Reserve Bulletin*, July 1931 and following issues.

**App. 23. Index of wholesale prices (Bureau of Labor Statistics), monthly, 1890-1945.** SOURCE: Bureau of Labor Statistics; for 1890-1931, see *Bulletin Nos. 543 and 572*; since 1931, see various issues of *Wholesale Prices* and various bulletins. No seasonal adjustment is considered necessary (but compare the seasonal index given below for series App. 24). For a related annual BLS index, see series L 15.

The index is based on quotations for approximately 250 commodities 1890-1912; 550, 1913-1925; 784, 1926-1937; and a gradually increasing number (to about 890) since 1937. Prices are obtained weekly in most cases. The prices are weighted by quantities marketed, varying weights being used through 1936 and fixed weights thereafter. For methods employed in computing the index see *Bulletin Nos. 473, 493, 572*, and an article by Cutts, Jesse M., and Dennis, Samuel J., "Revised Method of Calculation of the Wholesale Price Index of the United States Bureau of Labor Statistics," *Journal of the American Statistical Association*, December 1937 (or the similarly entitled BLS pamphlet R666).

Monthly indexes for various economic classes of commodities (raw materials, semi-manufactured articles, and manufactured products; farm products, nonfarm products, and products other than farm products or foods) have been compiled by the Bureau of Labor Statistics beginning 1913. Monthly indexes for certain other classes (e. g., durable and nondurable goods, producers' and consumers' goods) have been compiled from BLS data for 1927-

1948 by the National Bureau of Economic Research (cf. Mills, Frederick C., "Prices in a War Economy," and "The Structure of Postwar Prices," *Occasional Papers 12 and 27*, National Bureau of Economic Research, New York, 1943 and 1948).

**App. 24. Index of wholesale prices (Warren-Pearson), monthly, 1850-1894.** SOURCE: Warren, George F., and Pearson, Frank A., in part 1 of *Wholesale Prices for 213 Years, 1720 to 1932, Memoir 142*, Cornell University Agricultural Experiment Station, 1932. The index is not adjusted for seasonal variations, although slight seasonal movements are evident. The following seasonal index, January to December, is given for 1876-1891 in table 88 of the source volume: 102, 102, 102, 101, 100, 98, 98, 99, 99, 99, 100, 100.

The authors computed an index for the period 1797-1893, based principally on New York quotations, for commodities numbering 116 in 1800, 134 in 1850, 135 in 1860, 146 in 1870 and 1880, and 138 in 1889. These commodities were divided into 11 groups corresponding to the classification used for the Bureau of Labor Statistics index of wholesale prices (series App. 23); and for each group a variable weight index was computed by expressing the monthly price of each commodity relative to its average price in 1876-1891 and combining relatives with the weights assigned to the particular year.

The group indexes were then combined into a total index on the base 1876-1891 using varying group weights (percent) as follows: Farm products, from 35 in 1799 to 25 in 1889; foods, from 27 to 25; hides and leather, from 5 to 4; textiles, from 8 to 10; fuel and lighting, from 4 to 10; metals and metal products, from 4 to 10; building materials, 10; chemicals and drugs, from 0.5 to 1.0; housefurnishings (beginning 1840), 1.0; spirits, from 5 to 3; and miscellaneous, from 1.5 to 1.0. Both for individual series and for groups, the change in weights each year was one-ninetieth of the total change over the period. (Constant group weight indexes are also given in the source.) The final index on the base 1910-1914 was derived by means of a 4-year overlap, 1890-1893, on the Bureau of Labor Statistics index. The published figures for the Warren-Pearson index end with 1889; beginning 1890 the index is the Bureau of Labor Statistics index.

For the Warren-Pearson index on a 1926 base, with earlier data back to 1720, see Bureau of Labor Statistics *Bulletin No. 572*, 1933, pp. 111-14. For the Warren-Pearson annual index, see series L 2.

**App. 25. Index of stock prices: Industrials, utilities, and railroads, monthly, 1871-1945.** SOURCE: Standard and Poor's Corporation, *Trade and Securities Statistics: Long Term Security Price Index Record (through December 31, 1940); Security Price Index Record, 1941 and 1942; Current Statistics Combined with Basic Statistics*. No seasonal adjustment is considered necessary. For related annual data, see series N 215-220.

Prior to 1918, the index is that of the Cowles Commission, converted from the original base (1926) to the 1935-1939 base by Standard and Poor's Corporation. This index includes, 1871-1917, virtually all industrial, public utility, and railroad common stocks actively traded on the New York Stock Exchange. The railroad stock price component is the index compiled by Macaulay (series App. 26) and during most of this period this component dominates the total, since relatively few industrial and public utility stocks were traded, especially before 1900. The prices used in the Cowles Commission index, in general, are averages of the highest and lowest sales prices of the month. The price relative for each issue in the index receives a weight equal to the product of the price per share by the number of shares outstanding. For a detailed description of the index see *Common Stock Indexes, 1871-1937*, by Alfred Cowles 3d and Associates, 1938. A useful annotated bibliography of common stock price indexes is given in Appendix I of that volume.

Beginning 1918 the index is based on monthly averages of weekly indexes of prices. The number of stocks included has increased over the period; in 1941 the index included 402 common stocks (354 industrials, 28 public utilities, and 20 rails). Prices

are weighted by the number of shares outstanding, as described in the initial source, pp. 3-4.

**App. 26. Index of stock prices, railroads, monthly, 1857-1885.** SOURCE: Compiled by Macaulay, Frederick R., *The Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, New York, 1938, table 10. No seasonal adjustment is considered necessary.

This index number is based on the prices of common stocks of virtually all American railroads whose prices were being regularly quoted on any of the great exchanges. No preferred stocks are included. The list of companies changes from time to time because of consolidations and lack of quotations. Railroads were also dropped from the index in some instances while the railroad was in the hands of a receiver or undergoing reorganization and in a very few cases "during periods in which exceptional circumstances only negligibly related to their investment values were violently disturbing their prices" (source, p. 139). The list of railroads and the periods during which their stocks were used are shown in chart 32 of the source.

The index is a chain index made up of 13-month segments (from January to January), each segment consisting of weighted arithmetic average prices of an identical list of stocks. During each time segment prices per share of each stock were adjusted for all stock dividends, rights, etc., that occurred during the 13 months. Weighted arithmetic average prices for each month were then calculated, the weights being the number of shares outstanding in the initial January of each segment. The weighted average prices in the various segments were then chained together, starting from the segment January 1926-January 1927. A detailed discussion of the construction of the index may be found in the source, chapter 5.

Although Macaulay's index is available in the source through January 1937, it is presented here only through 1885. Its place is filled by the index of stock prices—industrials, public utilities, and railroads (series App. 25) which begins in 1871. The latter index is based in part on and is very similar to Macaulay's until World War I, since railroads were, especially in the early years, by far the most important class of stock. Macaulay's index, however, is more homogeneous both because it is confined to railroad companies and because quotations for the component companies are more continuously available.

**App. 27. Commercial paper rates, monthly, 1857-1945.** SOURCE: Furnished by the National Bureau of Economic Research, New York. Through January 1937, see Macaulay, Frederick R., *The Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, NBER, 1938, table 10 (except for misprinted figure for February 1903); since February 1937, computed from weekly data in *Bank and Quotation Record of the Commercial and Financial Chronicle*. Seasonal adjustment by the National Bureau of Economic Research; a slightly different seasonal adjustment is given by Macaulay (table 23); no seasonal adjustment has been necessary since 1934.

*Commercial paper* consists of promissory notes, offered on the "open market," on which merchants and manufacturers whose credit is well-established and well-known borrow money for use in the ordinary course of their business. The quotations used here are for the New York City market. Prior to 1865 Macaulay compiled the data from various published sources; since 1866, from the *Commercial and Financial Chronicle* or its *Financial Review*. Through 1923 the rates are for "choice 60- to 90-day two-name paper"; since 1924, "4- to 6-month prime double and single name paper"; the transition, however, has little or no effect on the comparability of the series. Monthly averages were obtained for the most part from weekly average rates.

For a description of the series and a discussion of other historical series of short-term interest rates see appendix E of Macaulay's volume. See also *Banking and Monetary Statistics*, pp. 422 ff.

**App. 28. Corporate bond yields, monthly, 1919-1945.** SOURCE: Compiled by Moody's Investors Service. For 1919-1941, see *Banking and Monetary Statistics*, Board of Governors of the Federal Reserve System, 1943, pp. 468-71; since 1941, see *Federal Reserve Bulletin*. No seasonal adjustment is considered necessary.

This series is an index of yields on highest rating (Moody's Aaa) industrial, public utility, and railroad bonds. The number of bonds included has varied over the period; 15 were included in 1919-27 and 30 in 1928-33; since 1933 the number has been reduced owing to the limited number of suitable issues. Substitutions have been made from time to time. The index consists of unweighted arithmetic averages of the yields of individual bonds; the yields for each bond are based on averages of the month's high and low sale prices prior to 1928, and on monthly averages of weekly or daily closing quotations since 1928.

Indexes are compiled, also, for lower rating groups of bonds, and separately for industrial, public utility, and railroad bonds.

**App. 29. Railroad bond yields, monthly, 1857-1936.** SOURCE: Macaulay, Frederick R., *The Movements of Interest Rates, Bond Yields and Stock Prices in the United States since 1856*, National Bureau of Economic Research, New York, 1938, table 10, col. 5. For a related annual index, see series N 201-202.

This series is an index based on the yields of 150 American railroad bonds listed, except in a few instances, on the New York Stock Exchange. The number of bonds included at any one time varies, however, from a minimum of 13 in 1857 to a maximum of 45 in 1925-1927, owing to changes in the number of issues outstanding, changes in the "activity" of an issue and hence the availability of continuous price quotations, and changes made (e. g., deletions of bonds approaching maturity, or bonds with highly erratic yields) in order that the index would reflect long-term interest rates. Averages of the high and low prices in each month for each bond were computed from quotations taken principally from New York Stock Exchange official sheets and the *Commercial and Financial Chronicle*, and these average prices were converted to yields by the author. The monthly yields for each bond included in the index are given in table 3 of the source.

The index is a chain index constructed from 13-month segments running from January to January, each segment consisting of unweighted arithmetic averages of the yields of an identical list of bonds. Starting from the January 1924-1925 segment, the segments were chained together on the basis of the ratios of the average yields in the overlapping Januaries. An adjustment was then made for "economic drift," designed to make the long-term movements of the index (which includes yields of bonds of all grades) approximate those of a standardized list of high-grade bonds. For a full discussion of this adjustment and other details of the construction of the index see chapters 3 and 4 of the source.

The index presented here is not adjusted for trend; it is available in the source in smoothed and trend-adjusted form. No seasonal adjustment has been made, although in certain years (for example, 1867-1873) a slight tendency towards repetitive movement is visible. The index is not available beyond January 1937.

**App. 30. Liabilities of business failures, quarterly, 1875-1894; monthly, 1894-1935, June 1934-1939, 1939-1945.** SOURCE: Compiled by Dun and Bradstreet, Inc., formerly by R. G. Dun & Co. Published in *Dun's Review* and *Dun's Statistical Review*. Seasonal adjustment by the National Bureau of Economic Research.

A failure is currently defined as "a concern which is involved in a court proceeding or a voluntary action which is likely to end in loss to creditors." (*Dun's Review*, March 1940, p. 39.) The series includes manufacturing and mining concerns, builders, employers of labor in the mechanical arts, trading concerns; but not professional men, banks (after 1892), or railroads; real estate and insurance brokers, shipping agents, etc., are excluded beginning 1933. The revision beginning June 1934 is the result of the addition of certain cases formerly classified as reorganizations, but considered to be failures after a change of the National Bankruptcy Act, effective September 22, 1938. The data revision beginning 1939 is due to more complete coverage of voluntary discontinuances.

Series on numbers as well as liabilities of failures are compiled by Dun and Bradstreet, Inc., and data are classified by type of business and size of firm. Similar series were published from 1882 to 1933 in *Bradstreet's*; they differed from Dun's apparently in including banks and excluding stock and real estate brokers.

## Appendix II. Statement of Basic Premises

As an initial step leading to the compilation of this volume, a working outline and a statement of basic premises were prepared to place the various parts of the task in appropriate perspective, and to serve as operating guides. These documents were sent to each agency or individual consultant requested to review, suggest, or provide statistical or text materials for inclusion in the edition.

This procedure was designed to insure maximum uniformity in treatment, section to section, and to provide both the editorial staff in the Bureau of the Census and each contributing or reviewing agency or person with the basic framework within which all contributions should fit, in order that the work of many hands result in a fairly balanced product.

The original working outline of subject material was necessarily altered considerably in the process of review and compilation. The statement of basic premises for data selection was not altered to any material extent, but deviations from the standards set forth, or implied in it, became necessary. The original statement of basic premises is reproduced here without significant change. It may be considered as representing the standards proposed for the forthcoming revision of the volume; comments and criticisms of it by users of the present edition will be appreciated.

### Basic Premises for Data Selection

#### A. GENERAL

This statement is designed to provide specific information as to the considerations involved in the selection and review of time-series data included in the preliminary edition of *Historical Statistics of the United States*. This volume is being prepared by the Bureau of the Census with the advice and assistance of the Social Science Research Council. Summary social, economic, and political statistics, carried back in time, will be presented, accompanied by descriptive and qualifying notes.

**Purpose of volume.** The purpose of the volume is two-fold:

1. To provide a convenient source of reference for technicians who need information outside their immediate field of specialization, teachers and students of the social sciences and related subjects, librarians, and others who may wish to make direct use of the materials presented.
2. To provide more intensive students with a summary guide to the more important time-series data available (for various periods of time) and the principal qualifications as to interrelationship of such series. Also, it should provide specific indications of the sources which may be referred to for additional data and for more detailed discussion.

**Selection problem.** The selection problem is crucial since the volume is to comprise only about 3,000 series of statistics out of the scores of thousands of series available which have a duration of 20 years or more. About one page of descriptive text will be shown for each page of statistics although this ratio may vary considerably from chapter to chapter.

#### B. OPERATING PREMISES

In order that all consultants may review the materials with a common frame of reference, certain operating premises have been established. These premises comprise broad statements as to coverage in terms of area, time, subject detail, and the presentation of absolute as compared with derived data.

**Area coverage.** Confine presentation to data for continental United States as a whole, wherever reasonable. Variations may be warranted—

1. Where regional statistics are essential for correct interpretation of data, such as presentation of merchant-

marine statistics separately for each coast and for inland waters.

2. Where data in the subject field cannot (by definition) be summarized effectively for continental United States, such as internal migration data.

3. Where summary data for a given subarea or market are indicative of general trend or level, such as prices on the New York Stock Exchange or cattle prices at Chicago.

4. Where data for a given area effectively represent the national picture because of concentration of production, etc., as Pennsylvania anthracite.

5. Where the only available data include figures for one or more of the territories and possessions, or the data are more meaningful with such inclusion, such as statistics on certain mineral products and fisheries.

6. Where data are available for only a given area as in the case of many series concerned with early American history which are limited to the Atlantic seaboard.

**Time coverage—General.** Normally present only those series which conform to all three of the following requirements: *Annual or census-period data; cover at least 20 years; begin not later than 1920.*

Variations from the general premises as to time coverage should be considered primarily in the case of newly-developed series of basic importance, particularly when presented in conjunction with traditional series in the same field, such as "Man-days idle" in work stoppages.

**Note:** A special appendix will be included which will show turning points of business cycles and will contain a few illustrative series of basic significance presented on a monthly or quarterly basis. The existence of this appendix, however, should not be counted upon to round out a subject or time-period presentation in the main part of the volume.

**Time coverage—Lapsed series.** The general requirements as to time coverage are specifically designed to permit inclusion of "lapsed" series; that is, series of statistics which both begin and terminate in past time, particularly those covering periods during the nineteenth century.

These series are of paramount importance in interpreting the past. In general, they have lapsed either because the phenomena measured no longer exist (slave population, 1790 to 1860); or because more precise means of measurement have superseded them (thus early and modern series of statistics on manufactures are not strictly comparable).

Failure to include series of these types would leave unrepresented major fields of interest during various phases of American historical development. Furthermore, such data are not only scarce; they frequently are located in out-of-print books and documents, governmental and private, available in few libraries.

In order to insure more fully the inclusion of "lapsed" series, the following two paragraphs should be noted particularly:

1. *Review in terms of broad periods.* Since the comparative wealth of data available for the recent period may tend to distract attention from the need for data for earlier times, it is suggested that the consultant, at some point, review the presentation in terms of several broad historical periods appropriate to the given field. Thus, one arbitrary division of time might be 1790–1860; 1860–1900; 1900–1945. Each such period should be represented, as far as possible, in the selection of data. This type of review will help to insure a cross-section of available data for major past segments of time.

2. *Problem of comparability with modern data.* Obviously, few historical series, or fragments, of the "lapsed" type are strictly comparable with modern series in the same field; nor are the basic definitions or collection methods on a comparable technical level. However, identical stand-

ards of technical adequacy should not be applied when considering series representing different broad periods of history. An important feature of the descriptive text should be the provision of appropriate warnings as to the reliability and general limitations of the data presented.

**Subject detail.** Confine presentation to series that are regarded as of major importance in each field; limitations on space make this essential. The criteria of selection must vary broadly depending upon the subject. Within each subfield, the amount of subject detail should be held to a minimum. Broad considerations are as follows:

1. Show summary data or measures, primarily.
2. Any subseries should be of major significance in itself since it must compete for space with major series in the same and other fields.
3. Avoid detailed cross-classification of data. Where subclassifications are shown, they should not ordinarily be crossed with one another, because of space limitations.

**Presentation of absolute rather than derived data.** Concentrate largely on absolute figures rather than on derived data since the absolute figures offer somewhat greater flexibility to the user of the volume. The major exception should be the presentation of index numbers in general use. Several general points are:

1. Avoid presenting percentage distributions of absolute data already shown. Other percentage data, and averages, medians, ratios, and rates should be introduced only (a) where they result in a significant economy in space; or (b) where, in the case of a series of major importance, the derived measure greatly facilitates interpretation.
2. Differences in base periods employed for various series, or segments of the same series, should not, in themselves, militate against presentation of index numbers.

In general, no attempt will be made to convert various

series of index numbers to a common base year or period. This decision is based on a number of factors, of which two may be mentioned: (a) Treatment in *Historical Statistics of the United States* similar to that in the original source is important since the user may wish to refer to an original source for additional detail; and (b) use of any simple conversion factor would result, in some cases, in conversions of doubtful usefulness.

3. Adjusted data should be included if deemed more useful than unadjusted data. However, adjusted series should be accompanied, where possible, by a notation as to adjustment method, as well as a footnote stating that the adjustment has been made. By an "adjusted series" is meant one which incorporates modifications designed to improve the original data, or to make it more useful.

#### C. FLEXIBILITY OF SELECTION PREMISES

**Dangers to be avoided.** In applying the basic premises outlined above, two dangers should be avoided;

1. *Excessive rigidity.* Rigid adherence to the premises will have a straight-jacket effect. Differences inherent in subject material, the needs of the users, availability of data, and recency of subject-development, should all be taken into account and the premises applied accordingly.
2. *Excessive flexibility.* Casual disregard of these premises will mean, at best, unevenness in development within and between subject fields; at worst, it may result in presentation of a miscellany of data.

**General rule in applying premises.** In general, the relaxing of one broad premise should be accompanied by a tightening of the others. *Example:* If data are to be shown by geographic region (rather than merely for continental United States as a whole), the subject coverage should be limited and only those series presented which have a long duration in time.

**Time-Period and Alphabetical  
Subject Indexes**

*(previous page  
deliberately left  
blank. AL)*

TIME-PERIOD INDEX

[Entries are series numbers. Each statistical series has been allocated to the period of time for which the earliest figure in the series appears. For most series, an entry for a given time period means that the figures are presented for that and all later time periods. Series numbers in italics (*A 234*) are those for which the entire presentation is confined to decennial data; most of the remaining series present annual statistics.]

TIME-PERIOD INDEX—Con.

[Entries are series numbers. Each statistical series has been allocated to the period of time for which the earliest figure in the series appears. For most series, an entry for a given time period means that the figures are presented for that and all later time periods. Series numbers in italics (*A 234*) are those for which the entire presentation is confined to decennial data; most of the remaining series present annual statistics.]

CHAPTER	TIME PERIOD FOR WHICH EARLIEST FIGURE APPEARS FOR INDICATED SERIES				
	1890-1899 (331 series)	1900-1909 (392 series)	1910-1919 (551 series)	1920-1929 (454 series)	1930-1945 (90 series)
A. Wealth and income	A 27-29, A 51, A 53, A 66	A 43, A 45, A 55-57, A 59, A 61-62, A 64-65, A 67-68, A 70-71	A 58, A 176-194, A 195-197	A 60, A 72, A 75-99, A 101-116, A 117-133, A 134-144	.....

# ALPHABETICAL SUBJECT INDEX

	Series No.		Series No.		Series No.
Accidents and fatalities:		Anthracite coal—Continued		Books, printing and publishing, value of	
Air transport	K 265-278	Production	G 16-18	output	J 75, J 122
Coal mines	G 144-153	Apparel:		Bookkeepers, accountants, and cashiers	D 93
Mines (except coal)	G 133-136	Consumers' prices, index	L 43	Branch banking	N 90-98
Quarries and related industries	G 140-143	Manufacture, value of output	J 60, J 108	Brick (common), physical output	J 163
Railroads	K 84-93	Wholesale prices, index	L 29	Brickmasons, stonemasons, and tile setters	D 103
Accountants, bookkeepers, and cashiers	D 93	Apples, production and returns	E 231-233	Building and Loan Association failures	H 133-135
Acid (sulphuric), physical output	J 156	Appliances, manufacture:		Building materials:	
Acquisition, U. S. territory	B 24-25, F 1-7	Cooking and heating apparatus	J 67, J 115	Construction materials	H 49-50, J 96, J 146-148
Acreage, farm:		Electrical	J 71-72, J 85, J 116, J 134	Nonmetals	G 65-76
52 crops, combined	E 74-75	Household, including mechanical refrigerators	J 63	Wholesale prices, indexes	L 10, L 22, L 32
Crops, by kind	E 181-191, E 196-208, E 211-217, E 225-228	Office and store	J 87-88, J 136-137	Building permit indexes	H 74-79
Irrigated land	F 59	Ophthalmic products and surgical and orthopedic	J 81	Monthly data, value	App. 20-21
Tenure of operator	E 31-36	Radio apparatus	J 72	Building trades (see also Construction):	
Utilization	F 23-32	Apportionment of congressional representation	P 57-61	Average wages, hours, and earnings,	
Acreage, land:		Appropriations (see also various series on government receipts and expenditures):		indexes	D 110, D 114-116
Land utilization	F 25-36, F 37-51, F 52-61, F 62-68	Congressional bills vetoed	P 83	Hours, wages and earnings	D 109, D 125-126
Public lands	F 8-17, F 19, F 20-24	Public Health Service	C 118	Union wage rates and hours, indexes	D 152-157
U. S. total and public domain	F 1-7	Area (see also Acreage):		Buildings. See Construction industry, Dwelling units, Farms, etc.	
Acreage, national forest areas	F 69-70	Continental United States	B 25, B 26-28, F 1-3, F 25-27	Business activity, physical volume,	
Forest fires, area burned over	F 144-150	Land ownership	F 37-51	monthly index	App. 5
Purchases	F 71	Land utilization	F 25-36	Business conditions, indicators of	App. 1-30
Admissions tax, internal revenue	P 119	National forests	F 69-70	Turning points of business cycles	Page 320
Age classification:		National parks	F 17	Business failures, liabilities	App. 30
Birth rates by age of mother	C 27-36	Public domain (original)	F 4-7	Business vehicles (see also Motor vehicles),	
Children (number) under 5 years old, rate	C 22-23	Public lands	F 8-16, F 19, F 20-24	manufacture	J 91, J 140-141
Citizenship status	B 237-278	Territories and possessions	B 25	Buses (motor), registrations	K 231
Death rates	C 65-76	Artificial limbs and ophthalmic products	J 129	Butter (see also Dairy products):	
Farm tenants	E 25-30	Automobiles. See Motor vehicles.		Consumption per capita for farm and	
Labor force, by sex	D 32-46	Balance of international payments	Page 237, M 1-41	creamery	C 149
Life expectation	C 6-21	Bankruptcy cases, farmers	E 256-257	Prices	E 166-167
Immigrants	B 333-336	Banks and bankers taxes, internal revenue	P 131	Production	E 156-158
Median age, by color and sex	B 72-80	Banks (see also Colonial and State, United States Bank (Second), National, Savings, Commercial, State, Private, Federal Reserve, etc., banks):		Butterfat in cream, prices	E 168
Median age, heads of families	B 181	Assets and liabilities	N 1-59, N 114-123	Call loans, interest rates, New York City	N 137
Population	B 36-39, B 81-144	Branch banking	N 90-98	Calories. See Nutrition.	
Agricultural implements and machinery:		Clearings at principal cities	N 86-89	Calves (see also Cattle and Cows):	
Equipment, value	A 5, A 48	Monthly data	App. 14-15	Price, veal calves per cwt	E 129, E 143
Farmers' expenditures for	E 103-110	Commercial and customer bank loan rates	N 188-195	Production, dressed weight	E 142
Manufacture, value	J 86, J 133, J 135	Debits	N 76-83	Slaughtered	E 140-141
National wealth components	A 5, A 48, A 50, A 79	Monthly data	App. 16-17	Canals and rivers (New York State), ton-	
Sales of equipment, machinery, and parts	E 107	Deposit turnover	N 81-85	mileage	K 168
Tractors on farms, number	E 106	Deposits of country banks, indexes	E 267-269	Canals and roads, federal expenditures	K 176
Value, inventory	E 105	Earnings and expenses	N 124-130	Canals (see also Shipping and water traffic):	
Agricultural land utilization program, etc.	F 62-68	Suspensions, by type of bank, number	N 135-147	Boats and barges, tons	K 98, K 123
Agricultural products. See Crops, Farms, and individual products.		and deposits	N 135-147	Land grants to aid in construction of	F 23
