\* The methodology for calculating median income and median earnings changed between **2008** and **2009**. Medians over \$75,000 were most likely affected. The underlying income and earning distribution now uses \$2,500 increments up to \$250,000 for households, non-family households, families, and individuals and employs a linear interpolation method for median calculations. Before 2009 the highest income category was \$200,000 for households, families and non-family households (\$100,000 for individuals) and portions of the income and earnings distribution contained intervals wider than \$2,500. Those cases used a Pareto Interpolation Method.

\*\* Only the collapsed versions of these tables are available in 5-year data products

\*\*\* Subject Tables S2403 and S2404 were modified to include tally estimates along with the percentages for "Total", "Male", and "Female." The median earnings portion of the tables were removed and are now available in S2413 and S2414.
