

During the course of creating the client data set for public use, it was decided that a format file should be created. This file contains all of the formats created during the course of the Urban Institute's work with NSHAPC client data. If you want to know which format (if any) should be used with a given variable, please refer to the client codebook. The data can be run with the formatting on or off. The library statement, referring to the formatting file, should always be included. What follows is a sample of how to use the pre-created format file.

```
/*Sample Program to Analyze Client Data*/

libname ddrive 'd:/' ; /*defines drive that you are working with*/

libname library 'd:/' ; /*references formatting file included in public
use file*/

data work;
set ddrive.pbclient;

if revdef=0;

format h1655 drink.;

proc freq;
weight cliwgt;
tables homlss h1655;
run;
```
