Annual Benchmark Report for Services:
Fourth Quarter 2003 to Fourth Quarter 2010

INTRODUCTION

The U.S. Census Bureau produces the Annual Benchmark Report for Services to provide revised national estimates of quarterly revenue and expenses for select service industries. (See the Coverage section below for more information on the industries included in the Quarterly Services Survey.) The quarterly estimates shown in this report have been revised in a manner that adjusts them to annual revenue and expense estimates from the Service Annual Survey. For more information about the revision procedure, see the Revisions to Previously Published Quarterly Estimates section.

This report contains the initial release of quarterly revenue estimates (not seasonally adjusted) for selected industries in Utilities, Transportation and Warehousing, Real Estate and Lessors of nonfinancial intangible assets (except copyrighted works), and Educational Services.

We develop the estimates in this report using data from the Quarterly Services Survey (QSS) and the Service Annual Survey (SAS). For each survey, we mail survey questionnaires to a probability sample of firms located in the United States and having paid employees. Therefore, the quarterly revenue estimates produced from QSS do not include revenue from non-employer firms (i.e., firms without paid employees).

Additional information on QSS and SAS can be found on the Census Bureau website at: http://www.census.gov/services/index.html.

COVERAGE

The estimates in this report are summarized by industry classification based on the 2002 North American Industry Classification System (NAICS).

NAICS groups establishments into industries based on the activities in which they are primarily engaged. This system, developed jointly by the statistical agencies of Canada, Mexico, and the United States, allows for comparisons of business activity across North America.

Estimates are presented for select industries in the following NAICS sectors (2-digit NAICS codes) and subsectors (3-digit NAICS codes):
For the Information sector, NAICS 2002 includes substantial revisions from NAICS 1997. Consequently, estimates are shown for only eighteen quarters for the affected industries for this sector. The correspondence table for the Information sector from NAICS 1997 to NAICS 2002 is provided at the following website:
http://www.census.gov/epcd/naics02/N02N9751.HTM

Detailed information about NAICS can be found on the Census Bureau Web site at:
http://www.census.gov/eos/www/naics

REVISIONS TO PREVIOUSLY PUBLISHED QUARTERLY ESTIMATES

The Census Bureau revises the previously published quarterly estimates to:

- Reflect historical corrections to data for the current QSS and SAS samples.
- Introduce results of the 2009 Service Annual Survey (SAS).
- Link the previously published estimates from the prior QSS sample to estimates from the current QSS sample.
- Incorporate updates to the seasonal adjustment models and parameters to reflect the revised estimates.

The remainder of this section describes the process used to produce the revised estimates. Quarterly revenue estimates for NAICS sectors/subsectors 22, 481, 483, 485, 486, 487, 488, 531, 533 and 61 are calculated as Horvitz-Thompson estimates and do not go
through the linking and benchmarking procedures described below. Estimates for these industries will be benchmarked when 2010 SAS estimates become available.

**Quarterly Revenue Estimates**

First, corrections are made to data obtained from the current QSS sample for the second quarter of 2006 through the third quarter of 2010. For industries starting in the first quarter of 2009, corrections are made to data from the first quarter of 2009 through the third quarter of 2010. Corrections are made to replace previously reported data with more accurate data received at a later date or to replace data that had been previously imputed with reported data obtained from the company.

Next, the revenue estimates for the fourth quarter of 2003 through the second quarter of 2006 from the prior sample are linked to the estimates starting with the third quarter of 2006 from the current sample. The linkage is performed at each detailed NAICS level (including separate breakouts by tax status for Sector 62) by multiplying the Horvitz-Thompson estimates from the prior sample by a geometric mean. The geometric mean is computed as the square root of the product of two ratios. The numerators of the ratios are the Horvitz-Thompson revenue estimates for second and third quarter 2006 from the current sample. The denominators of the ratios are the Horvitz-Thompson estimates for second and third quarter 2006 from the prior sample.

After performing the above linkage, the resulting revenue estimates for the fourth quarter of 2003 through the fourth quarter of 2010 are input to the benchmarking program. The benchmarking revises the estimates for a given detailed NAICS level in a manner that:

- For Sectors 51, 54, and 56, constrains the sum of the four quarterly revenue estimates for each year to equal the corresponding census-adjusted, annual revenue estimates for employers obtained from the Service Annual Survey (SAS) for 2004 through 2009. See the [SAS Technical Documentation](#) for a description of how the SAS estimates are derived.

- For NAICS 622 and NAICS 623, constrains the sum of the four quarterly revenue estimates for each year to equal the corresponding census-adjusted, annual revenue estimate for employers obtained from SAS for 2005 through 2009. Because data for these sub-sectors were not collected in QSS prior to the fourth quarter of 2004, SAS estimates for these sub-sectors from 2004 and prior years are not used in the benchmarking procedure.

- For NAICS 484, 492, 493, 532, 621, 624, and sectors 71 and 81, constrains the sum of the four quarterly revenue and expense (where collected) estimates for 2009 from QSS to equal the corresponding census-adjusted, annual revenue estimate for employers obtained from SAS. Because data for this sector were not
collected in QSS prior to the first quarter of 2009, SAS estimates for this sector from 2008 and prior years are not used in the benchmarking procedure.

- Minimizes the sum of the squared differences between the quarter-to-quarter changes of the input and revised quarterly revenue estimates.

A mathematical result of the benchmarking methodology is that all revised estimates following the end of the last benchmark year (2009) are derived by multiplying the corresponding input estimates by the ratio of the benchmarked-to-input estimate for the last quarter of the last benchmark year. Therefore, for a given detailed NAICS level, a ratio of the benchmarked-to-input estimate for fourth quarter of 2009 is computed. Quarterly revenue estimates after the fourth quarter of 2009 are multiplied by this constant ratio, which is called a carry-forward factor, to derive published quarterly revenue and expense estimates. The carry-forward factor remains the same until the next benchmarking operation.

Likewise, a carry-backward factor is used to derive published quarterly revenue estimates for quarters that precede the earliest annual constraint. The carry-backward factor for a given detailed NAICS level is the ratio of the benchmarked-to-input estimate for the first quarter of the first benchmark year (i.e., first quarter of 2004 for sectors 51, 54, and 56; first quarter of 2005 for sub-sectors 622 and 623). Quarterly revenue estimates for the fourth quarter of 2003 for sectors 51, 54, and 56 and the fourth quarter of 2004 for NAICS 622 and 623 are multiplied by these constant ratios to derive published quarterly revenue estimates.

Class of Customer and Other Estimates

Similar to revenue, the Horvitz-Thompson estimates for other data items from the prior sample are linked to the current sample estimates starting with third quarter of 2006, using a geometric mean involving the item of interest. After applying the geometric mean, a further adjustment may be performed to revise the quarterly estimates from the prior and current samples to ensure appropriate items sum to the quarterly total revenue estimate.

For revenue by class of customer, the estimate for a given quarter is multiplied by a ratio, where the numerator is the revised revenue estimate for the quarter, and the denominator is the revenue estimate for the quarter that was input to the benchmarking program. This procedure ensures the estimated proportion of revenue by class of customer is preserved after the revenue estimates are revised.

For expenses, the estimates are benchmarked using a procedure similar to that for revenue, where the sum of the four estimates of quarterly expenses for each year equals the corresponding census-adjusted, annual estimate of expenses from SAS.

For inpatient days and discharges, no further adjustment is made after the application of the geometric mean.
Revised estimates for aggregate industry levels are obtained by summing the revised estimates for the appropriate detailed industries comprising the aggregate.

**Seasonally Adjusted Estimates**

New seasonal factors are computed using the revised estimates as input to the Census Bureau’s X-12-ARIMA software. The new factors are used to produce seasonally adjusted quarterly revenue estimates for all available quarters for select industries. For a list of Frequently Asked Questions about the seasonally adjusted estimates, see [http://www.census.gov/services/qss/qssseasfaq.html](http://www.census.gov/services/qss/qssseasfaq.html).

**ADDITIONAL INFORMATION**

**Survey Questionnaires**

The Quarterly Services Survey questionnaires can be found on the Census Bureau Web site at: [www.census.gov/qss](http://www.census.gov/qss).

**Dollar Values**

All dollar values presented are expressed in current dollars; that is, the estimates are not adjusted to a constant dollar series. Consequently, when comparing estimates to prior years, users also should consider price level changes.

**Confidentiality**

Title 13 of the United States Code authorizes the Census Bureau to conduct censuses and surveys. Section 9 of the same Title requires that any information collected from the public under the authority of Title 13 be maintained as confidential. Section 214 Title 13 and Sections 3559 and 3571 of Title 18 of the United States Code provide for the imposition of penalties of up to 5 years in prison and up to $250,000 in fines for wrongful disclosure of confidential census information.
